The Robison mine, discovered about two years ago, and owned and worked by three brothers, has yielded during the last year over \$7000. Nearly all of this was clear gain, as only about 100 days' work was bled, and the rock was crushed in a water-power crusher belonging to the mine. Still another fact is that no stoping was done, and all this quartz was obtained from development work. A level tunnel was run along the lode 130 feet, and a shaft sunk on the dip of the lode a like distance—all in good rock with a vein averaging 16 inches. The best rock uncovered is in the bottom of the shaft.

The Glenn Olive is also a new mine which has yielded \$15,000 the last year, but a number of men have been employed at wages on this mine.

These two mines, with their machinery exempt, would sell to-day for enough to pay wages for every day's work done incident to mining, in this section, for the last two years.

The old pioneer miner, J. W. Sumner, still hammers away with a little five-stamp water-power battery. He has taken out \$9100 during the last year.

Some eight or ten other quartz enterprises have been worked in the vicinity with varying success, and it may be concluded that the yield of gold bullion for Kern county for the past year will not fall below \$100,000.

There has also been some prospecting for silver, and two mines were struck on Cook's

Peak, in Silverado district, six miles south of Kernville, which promised good for wages in argentiferous galena; but as this parties were prospecting only to sell, such a mine was desisted of no value.

Another mine has been struck on Erskine creek, 12 miles south of Kernville, which presents some peculiar features. The ore is in round or kidney-shaped masses, ranging from the size of an egg to 100 pounds in weight, of a lead-gray color, inclining to silver-whites, of conchoidal fracture; specific gravity perhaps nine, and hardness about that of galena. About two tons of this ore have been taken away for samples.

STEPHEN BARTON.

Kernville, Kern Co.

Comstock Ore and Bullion.

The following are the statements of the ore and bullion produced by the several Comstock mines mentioned below for the quarter ended March 31, 1890. Statements of the Alta, Cholara and Justice product have not yet been filed with the Assessor of Storey county, Nevada:

Con. Cal. and Virginia.—Produced 25,680 tons of ore, yielding bullion valued at \$469,574.66; total cost of extraction, \$198,656.40; cost of reduction, including transportation, \$179,760; total cost of production, \$378,416.40; yield in bullion per ton, \$18.10; yield above cost of production, \$91,158.60. Bullion tax, \$4557.93.

Challenge.—Produced 330 tons of ore, yielding bullion valued at \$5024.10; total cost of extraction, transportation and reduction, \$11,195.15; cost of production above yield, \$6171.15; yield in bullion per ton, \$15.50.

Confidence.—Produced 191 tons of ore, yielding bullion valued at \$2891.89; total cost of extraction, transportation and reduction, \$11,126.23; cost of production above yield, \$8234.34.

Con. Imperial.—Produced 212 tons of ore, yielding bullion valued at \$3217.60; total cost of extraction, transportation and reduction, \$21,881.45; cost of production above yield, \$18,663.85.

Hale and Norcross.—Produced 5859 tons of ore, yielding bullion valued at \$67,668.93; total cost of extraction, transportation and reduction, \$104,359.77; cost of production above yield, \$36,690.79; yield in bullion per ton, \$11.90.

Overman.—Produced 1670 tons of ore, yielding bullion valued at \$22,597.10; cost of extraction, \$15,224.22; transportation, \$1670; reduction, \$10,020; total cost, \$17,914.22; yield above cost of production, \$4682.97; bullion tax, \$234.14.

Savage.—Produced 4570 tons of ore, yielding bullion valued at \$65,795.76; total cost of extraction, transportation and reduction, \$30,718.68; cost of production above yield, \$14,922.92; yield in bullion per ton, \$18.16.

Yellow Jacket.—Produced 3608 tons of ore, yielding bullion valued at \$33,999.62; cost of extraction, \$29,877.57; transportation, \$3608; cost of reduction, \$18,000.80; total cost of production, \$51,526.37; yield above cost of production, \$2466.25; bullion tax, \$123.31.

THE COMSTOCK LODE.—The general outlook on the lode is favorable without being exciting. It promises good returns for regular working, but just at present nothing is in sight on which to found a boom. In several leading mines, prospecting drifts are advancing in a fertile formation with some metal showing, and in these there is a chance for the "unexpected" to happen. The reopening of the deep levels of the Gold Hill mines will add to the average solidity of the Comstock situation, whether or not any new development shall be made that will result in speculative movements. This, however, will be a matter that will not in any way materially influence the price of mining shares until some time next fall. In the meantime the Comstock will undoubtedly enjoy a season of solid prosperity, as the indications at present are that the mills will be able to run nearly all summer; therefore the miners will be able to get in about two months' extra work, which means about half a million more than usual distributed among our people.

THE IRON AND STEEL COMPANY.—A meeting of the stockholders of the California Iron and Steel Company was held last week for the purpose of getting the stockholders to authorize the Board of Directors to issue bonds to the amount of \$100,000, to be secured by a mortgage upon the real estate of the company, to run five years at six per cent interest, the money to be used to pay off the liabilities of the company. The authority asked for was given, and the old bondholders will be paid \$72,000, and the balance of \$18,000 will be used to pay off all other outstanding indebtedness and leave the property, which is valued at \$350,000, free. This will put an end to litigation, which has hampered the company for some time, and give it a fresh start.

CEDROS ISLAND MINING.—Advice from San Diego say: The Cedros Island Mining Co. has chartered the Carlos Pacheco to make regular trips between this point and the island, taking down supplies and returning with ore. The company already has four sailing vessels, mostly schooners, plying between the above points, but ore is not coming up as fast as it is taken out, and larger carrying facilities had to be secured. The ore is of high grade.

The Deep Gold Placers of California.

NUMBER V.

Written for the PRESS and Copyrighted 1890, by HENRY G. HANES, F. G. S. A., F. G. S. J.

Channel Filling—Minerals.

Other minerals besides quartz are found in the deep channels and in the hydraulic and shallow placers—some on the bedrock, some disseminated throughout the mass; but the quantity is extremely small as compared with the quartz and clay.

As far as my observation goes, the following comprise all the channel minerals:

Albite, augite, barite, chromite, clinnabar, corundum, diamond, galena, garnet, gold, graphite, gypsum, limonite, iridium, lead, lignite, limonite, magnetite, orthoclase, platinum, platiniridium, pyrite, pyroclastic, serpentine, stream tin, water, zircon.

None have sufficient economic value to be worth extracting except gold, for the sake of which the most stupendous operations have been undertaken and successfully prosecuted.

Albite (soda feldspar) is of rare occurrence in shallow placer mines, and is almost universally associated with other minerals in the form of pebbles. It is unknown in the deep placers.

Augite (silicate of lime, magnesia, iron, etc.) This mineral occurs as one of the constituents of certain lavas found in the form of boulders and pebbles in some shallow placers in California, notably in Black Hawk Canyon, San Bernardino county, with gold, copper and lead ore.

Barite (sulphate of barytes) has been observed at the Malakoff hydraulic mine, North Bloomfield, Nevada county. It appears only in the cleanup in small rounded pebbles; it is not common. Other localities no doubt exist, for the mineral in veins is quite abundant in this State and others on the Pacific Coast.

Chromite (chromic iron) generally in a finely divided state constitutes a portion of the concentrates which accumulate in the sluices and undercurrents in numerous hydraulic mines. It is a common mineral in California in serpentine, which rock is often deeply cut by the auriferous channels.

Cinnabar (sulphide of mercury).—This mineral is found, but rarely, as a scarlet powder in the cleanup washings made in shallow placer mines. Cinnabar is a common mineral in the Coast Range of mountains, but is unknown in place on the western slope of the higher Sierra Nevada.

Corundum (impure alumina) is known to occur in the drift in the San Francisco Pass (Richthofen), and is said to be found in cleanup placer mines in the southern part of the State. Fine specimens resembling the rolled masses brought from India are found in the placer mines in Stanley Basin, Custer county, Idaho.

Diamond (crystallized carbon). Diamonds have been found in at least five counties in California, and always in mining for gold. There has never been any systematic search for them, but it is the opinion of some miners that more could be obtained if sought. The noted localities are near Volcano in Amador county; Spring Valley hydraulic mine near Cherokee, Butte county; near Placerville, El Dorado county; and in the platinum sands of the Trinity river, Trinity county.

Galena (sulphide of lead). Pebbles and boulders of vein matter containing galena are sometimes found even in the deep placers, but they are of rare occurrence. Some of the quartz mines now being worked at a lower altitude contain this mineral in considerable abundance, which was probably the case in the veins that once existed in the eroded bedrocks, but being of a fragile nature, the galena must have been lost to view or changed to other minerals.

Garnet (anhydrous silicate of sundry bases). Garnets are often found in the channel filling; in fact it is hardly possible to find close concentrates without them. The species have never been determined; they are generally very small. They were detected by me in the Ohio glacial drift, as shown elsewhere.

Gold.—Although this is the most valuable mineral found in the channel filling, the quantity is much smaller, bulk for bulk, than most of the others. It is not generally known how very small the quantity of gold is, as compared with the amount of earthy matter in the channels.

The early miner gathered the gold which had been concentrated by long-continued geological forces. The drift miner does the same thing but in a different manner, and not without the investment of a large capital in money and labor. He takes the coarse gold only, found on or near the bedrock, but rejects, as worthless, channel matter quite as rich in the precious metal as the average worked by the hydraulic miner.

The following figures will convey to the mind of the reader some idea of the vast amount of labor and capital invested in gold mining in California, and how small the per cent of yield. Taking the North Bloomfield hydraulic mine as a type, and assuming that the drift mines are no richer, if the entire channel filling is included in the estimate, it may be shown from the official reports of the company that the total cubic yards washed from the top and bottom gravel from Nov. 29, 1876, to Oct. 13,

1877, was 2,293,930. The yield of gold was 12.7 cents per cubic yard, or \$291,329.11.

Each cubic yard of this gravel averaged 1.8 tons in weight (2,293,930 ÷ 1.8 = 2000 = 825,145,000 pounds avoirdupois). One pound of pure gold being worth \$301.46, therefore (\$291,329.11 ÷ \$301.46 = 966.3 pounds of pure gold), then the pounds of gravel being divided by the pounds of gold, we find that 8,546,153 parts of gravel must be worked to obtain one part of gold.

Genesis and Placement.

There has been much controversy among geologists as to the genesis of gold, or rather its placement in the quartz vein matter, which is regarded by miners as "the mother of gold." The most rational hypothesis to my mind is that gold which during the gaseous state of the earth gravitated to or near its center, has been brought to the surface mechanically by upheaval and eruption of plutonic rocks; these being disintegrated and comminuted, it was wafted to ancient seas and became one of the constituents of sedimentary rocks, now the so-called bedrocks. Solfataric action subsequently filled accidental fissures and at the same time deposited the gold gathered from the generally sedimentary wall rocks.

Notwithstanding the opinion of others, my own belief is, that nuggets as such, freed from the vein matter in which they once lay, do not grow, but on the contrary diminish in size until wholly changed to float gold, which is borne again to the sea.

I was once asked by a person holding a different opinion why it was that we find in placers larger masses (nuggets) of gold than we ever do in quartz mines. My reply was that the denudation which freed the placer gold from the quartz was so far greater than that by any mining operation, that the chances of the occurrence of such masses is in the former case greatly multiplied.

John Hutchinson ("State of Nature or Instincts, with a Treatise on Mining and Observations in 1706, London, 1749") expressed the opinion that mineral veins were filled from the wall rocks in the following words: Fol. 189. "As Spar and Lime Stone occurs Powder in Grit, Talk called by several names Cockle, Blackjack &c in several Sorts of Stone and always in one or both of the Sides or Strata which include the Vein at the same Level or at different Depths such are found in the vein and are Demonstrations that as that Matter came with the Ore that Matter and the Ore came out of the next adjoining Strata."

A further perusal of this remarkable work would be of interest to those who think these ideas modern.

William Wallace ("The Laws which Regulate the Deposition of Lead Ores in Veins, London, 1861,") wrote an able work on this subject, and I believe that most geologists now admit the conveyance of metallic minerals in solution, and their placement in veins.

When we have expressed the opinion that the gold in the placers came mostly from quartz veins, it may be asked, How came the gold in the quartz? In reply to this supposititious question, the field will broaden and we shall be compelled to admit that further statement must be conjectural.

If we express an opinion that gold was deposited in veins, by infiltration from sediments changing to rocks, the question will follow, Whence the gold in the sediment? and the only reply that can be made will be that it was probably in the eruptive rocks from which the sediments were formed, and that it was brought up by them from the interior of the earth. It is sufficient for our present purpose to assume that the direct source of the gold in the deep placers was the quartz veins and the pyrites in the slate bedrock.

Geologists seventy-five years ago generally believed that thermal springs owed their heat to volcanic agencies, and supported their opinion by calling attention to the numerous earthquakes.

Solfataras were called fumavols by Pinkerton (Petrology, London, 1800), or pseudo-volcanoes and volcanello. He describes spontaneous combustion of peat and lignite. The mountain of Crenasao was burning in the year 1400, the hill of Fontaynes took fire in 1763, the miners having been in the habit of taking out the large coal and leaving the slack, which fermented and ignited. The same thing happened near Reno in Nevada a few years ago.

The solfataric theory of the filling of fissures in the surface rocks of the earth may be stated, in general terms, as follows:

An accidental crack or fissure is caused by upheaval, earthquake, plication, or other manifestation of contraction, resulting from the gradual cooling of the planet. When a fissure was made, the hot water, now become a stronger mineral solvent, would not only take up matter in solution, but would bring together chemical substances; some having an affinity while others were antagonistic. A sort of natural chemical laboratory would thus be established, causing endless changes and resulting in the gradual filling of the vein with such elements and compounds as were within the reach of the collecting forces.

It must be clear that no gold could by any possibility be deposited in a mineral vein unless the metal existed somewhere in the rocks within the influence of the local chemical action. This would be true of all the other minerals and metals. In all parts of the earth's surface, veins have been filled, are being filled, and will be filled in the future; but if the minerals de-

posited are valueless, they pass without notice. In countries where gold, silver and other desirable metals are found, nature has simply collected these accidentally disseminated through the rocks, and condensed them in the mineral veins, where we discover and extract them. In considering this subject, no account must be taken of time, for these changes are slow. A vein may be filled, the surface denuded, and the metals scattered, oxidized, and combined with others, scores of times; new fissures formed and the metals, to a certain extent, collected again and again, and deposited in new forms.

This may at the present time be observed in active progress at Steamboat Springs, Nevada; at the Gayars; at the Mod Volcanoes in San Diego county; in Cozo District, Inyo county; at the Redington quicksilver mine, Lake county; at Sulphur Creek, Colusa county; at Sulphur Bank, Lake county; and other localities. Dr. Oxland, Prof. Joseph L. Conte, Prof. J. D. Whitney, and other writers in our State and elsewhere have called attention to these phenomena.

There is a continuous mineral-bearing formation in California, which extends through the entire State. It is somewhat hypothetical, and while known as "the great mother lode," and credited with producing all or nearly all the gold in the placers, it is now certain that this is a mistake, and that the true source of the precious metal in the deep placers was the numerous quartz veins and pyrite crystals in the underlying bedrocks of the high Sierra. I was an advocate of the mother-lode theory until observation caused me to change my opinion. It is now a well-established fact that gold occurs in the chlorite and talcose schists of the bedrocks themselves as well as in the quartz veins, rarely free, but generally in cubes of ilmenite, pseudomorphs after pyrite, sometimes half changed only. Gold released from such a mechanical combination is so finely divided, as a rule, that it would easily be washed away as soon as freed, and in my opinion it could not form nuggets or aggregations without being placed in veins by the natural process described.

If such crystals were crushed and in part roasted, the gold could be easily collected by the chlorination process; but they are so scattered through the rocks that they could not be separated without crushing the whole mass, which would necessitate subsequent concentration—an operation too expensive to be profitable.

It is my opinion that it may eventually be found worth while to crush the quartz boulders in the gravels. It is certainly cheaper to collect these than to sink deep and extensive shafts and mine this quartz in place. That they contain gold, may be safely assumed, and with cheaper labor, water-power, and the increased value of the bullion product, it may be found worth while to make the experiment on a large scale, much as the Alaskan gold mines are now being worked.

Distribution of Gold.

While most of the coarser gold in the drift mines lies on the bedrock, that in a finer condition is disseminated through the entire channel filling to the lava roof. As the upper gravels are too poor to be worked by any known process other than the hydraulic, millions of dollars worth of gold will for the present remain beyond the reach of man. The gold-miners make a distinction between the rich stratum and the poor gravels above. They have in use the term "pay dirt" or "pay gravel," which refers to earthy matter met with in their mining operations which contains gold enough to return the expenses incurred in its extraction and leave a margin of profit, be it great or small. When the yield is sufficient to allow all those engaged what they could earn if employed elsewhere by the day, they say that the claim "pays wages." They estimate values in prospecting by the amount of gold contained in a common miner's pan in a single operation of washing the pan full of earthy matter, and calculate with singular accuracy, "five cents to the pan," or any number of cents, as the case may be. Any particle of gold remaining in the pan, regardless of size, is called a color. By long practice, they judge the value of each color by the eye, sufficiently near the truth to know if the prospect will pay to wash on a large scale or not. They are too wise to trust to a few such tests, but before engaging in any extensive operation, spend some time in such a system of prospecting and average up the results with the greatest care.

Physical Condition of the Gold.

There is a marked difference between the condition of the gold in the deep placers and that found far from its source. This fact is a strong argument in favor of the glacial theory.

Gold is always found in the deep placers in a metallic state; in fact there is no mineral in which gold has been proved to exist in any other condition. In the so-called tellurides it is my opinion that the gold is with the tellurium a mechanical mixture. We believe that gold is conveyed in solution and deposited in vein matter, yet it is not impossible that in some, if not in all the cases, the gold may remain metallic, but so finely divided that it has some of the properties of a fluid. Gold in some of the pyrites crystals mentioned is in such a condition.

If gold is precipitated from a very weak solution by protosulphate of iron, some of the metallo precipitate will remain in suspension for hours, if not for days, and a portion will float on the surface of the solution in a golden skim.

After a majority of the gold has settled, the liquor will still retain for sometime a purplish tinge from the gold in suspension. Some gold exists in all the placers so fine that it will visibly float and will leave the pan in spite of the best endeavors of the most skillful panner. This fact is well known among miners and is the frequent theme of conversation. To save this float gold, many processes and varieties of apparatus have been invented, but the float gold eludes them all.

It is not usual to see gold in quartz howlers, although it is almost certain that it all came from just such quartz veins as those now being worked in various parts of the State. A few instances of howlers rich in gold have come to my notice. A specimen was shown to me some years ago by Dr. Robert Bowie, found in the Homeward Bound placer mine, near Iowa Hill, Placer county, on the bedrock; it was auriferous quartz showing the vein origin of placer gold. A large and very rich milk-white howler was found at the Polar Star hydraulic mine near Dutch Flat in Placer county, which I examined. The gold was bright and imbedded in the quartz. The howler was rounded like others in the slalom, and it is fair to assume that if this was from a vein, the others were so also. A howler from the Darbee drift mine, rich in gold, was of the characteristic blue quartz peculiar to the deep placers.

There is a distinctive character to the gold from different mines, its fineness also differing. The word fineness as applied to gold has a double meaning—mechanical division and the quantity of foreign matter alloyed in it. The latter sense is intended here. Gold in the deep placers has no luster, many of the grains have no appearance of gold, but more resemble magnetic sands. On examination, this is found to be due to a coating which sometimes partly and sometimes wholly envelops the metal. An inexperienced person would never suspect the real character of this coated or "rusty" gold, as it is called by the California miner.

It is fortunate that all the gold is not in this condition, for when so coated it cannot be amalgamated and is wholly or in part lost. Certain writers on metallurgy in the Eastern States and Europe have denied the existence of rusty or coated gold, and have implied that we are mistaken, because they have not seen it in this condition. If they or others interested in this subject should visit San Francisco, I shall be pleased to show them specimens from various localities, the examination of which cannot fail to convince them.

Several gentlemen in San Francisco have made a study of this rusty gold for years, among whom I may mention Melville Attwood, F. G. S., and Mr. A. B. Paul. Both have published papers on this subject which are of great interest.

Miners in California at an early date discovered that some placer gold was clean and of a yellow color, with highly metallic luster, while in others it was dark-colored, sometimes quite black and wholly unlike gold, except that it "stayed in the pan," flattened under the hammer, and was not attracted by the magnet. When cut with a knife, or melted before the blowpipe, it was found to be gold, and displayed the characteristic color.

While the former amalgamated perfectly, the latter was wholly indifferent to mercury and could be washed from a pan of quicksilver by a moderate force of water in motion. While these facts were well known, the reasons were not, and although the miners were well aware that a large portion of gold in the first operation passed through the sluices, undercurrents, grizzlies and other appliances, they were helpless to prevent it; but after being exposed to atmospheric influences for a time, it became cleaner, and a second portion could be obtained by another washing. At Red Gulch in El Dorado county, near where the first placer mines were discovered in 1848, it has been found profitable to work the placers at least seven times over. It is from this circumstance that the idea obtains among certain miners that the gold is renewed, or that it "grows again," as expressed by them. This is said to be a common opinion among Mexican miners. It was noticed that the gold obtained from the quartz mines was never rusty, and that river gold was much less so than that in the deep placers. These considerations led me as early as 1880 to commence a series of experiments and physical and chemical examinations of placer gold, and to collect specimens from as many localities as possible, which I have continued to the present time.

In that year I called attention to this very interesting and important subject in a paper read before the San Francisco Microscopical Society, which was published in the First Annual Report of the State Mineralogist, 1881; and a second paper which I reproduce here because it contains certain facts that have a bearing on the present discussion:

"Some years ago I read a paper, before this society on 'Rusty Gold,' giving the result of my experiments and observations up to that time. I have since continued the study of placer gold in this abnormal condition, which has led to the discovery of important facts bearing on the production of gold in California; and as these discoveries must to a great extent have remained unknown were it not for the microscope, I consider this society the proper medium through which to make them public.

"For many months I have conducted a series of experiments in my private laboratory on placer gold from numerous localities in the

State. I have also studied the behavior of gold in the presence of mercury under all conditions I could think of, the results of which have been carefully recorded and preserved for publication, the most important of which may be summed up as follows:

"When perfectly clean gold is exposed to the action of pure quicksilver, it is instantly seized by the latter and coated with amalgam. The accident of gold being alloyed with other metals in nature does not impair its affinity for mercury, if the surface is made bright mechanically by filing or scraping.

"Much of the native gold found in placer mines, apparently clean, is slightly tarnished by the oxidizing or mineralizing of its alloy, in which case it amalgamates with difficulty. I have failed in every instance to find gold in quartz in this condition, although intelligent miners have informed me that they have sometimes observed it in their experience. A large proportion of the placer gold found in California is wholly or partly coated with silica, cemented by sesquioxide of iron, as stated in my former paper.

"When wholly coated, it is perfectly inert to the action of mercury. One might as well put gold into a glass bottle and attempt to amalgamate it from the outside. When partly coated, the exposed parts become amalgamated; to that extent only is the gold held by the mercury. If rusty gold is digested in hydrochloric acid, the iron is dissolved and a slight mechanical force then serves to detach the silica, when amalgamation takes place without difficulty. There is no hope of being able to free gold from this coating during the few hours it is exposed to the forces employed in the well-known hydraulic process. When clean gold amalgamates, it does not become homogeneous, but the amalgam forms only on the surface. I have had a piece of placer gold in mercury standing in my laboratory for several months, during which time I have frequently triturated it, sometimes several times a day, and it is not yet dissolved; still in pouring it from one vessel to another the mercury flows freely without showing the gold, but I can at any time fish it up with my finger. Gold so amalgamated could not, in the process of placer washing, escape from the mercury; but coated gold under the same circumstances will float on the surface of the quicksilver, and any slight force will detach it.

"The coating of gold may be limited, as found by experiment. A piece of pure gold, after annealing, was placed in pure mercury, and it instantly became amalgamated. Another portion, exactly similar, was hammered on a perfectly clean and polished anvil, and placed in mercury like the first. It became as quickly amalgamated. Pure quartz was then ground to a powder and sifted on the anvil in a thin stratum. A third piece of the same gold was then laid on the powdered quartz, struck several times with the hammer, turned over, placed on a different spot, and again hammered. The gold was then examined under the microscope and seen to resemble the coated gold found in the placers, the quartz particles being imbedded in its surface. When placed in mercury and allowed to remain for some time with frequent agitation, it floated on the surface and seemed to be wholly unacted upon; but when placed under the microscope it was found that the mercury had attacked the gold through the small interstices, but only to a very limited extent. The gold was then placed on an iron slab and gently rubbed with an iron muller, by which treatment it became more perfectly coated, and was now an exact imitation of the natural coated gold, minus the iron cement. In the natural coating of placer gold, I consider the cementing to be a secondary process, and the sesquioxide of iron to result from the decomposing pyrite, which was abundant in the quartz veins that yielded the gold."

"The only way that rusty gold can be collected is by taking advantage of its great specific gravity independent of mercury. In hydraulic mining it becomes concentrated like the zircons and other heavy minerals, but it has often been thrown away because it was not recognized as gold. There is no evading the fact that a much larger quantity of gold is lost in California than is generally admitted. It is my opinion that fully one-half escapes the miner. This condition of gold is not confined to California. I have in my collection rusty gold from many localities, both in America and elsewhere.

I am of the opinion that the gold became coated under the glacial ice while the erosion of the rocks was in progress. The iron cement, so common in the deep placers, results from the decomposition of pyrites without a reasonable doubt; and the "brickbat," both here and in Georgia, has in my opinion the same origin. That the gold is battered and rolled, cannot be doubted by a careful observer. A specimen given to me by Mr. D. Brabban of Laporte is rolled up like a miniature cigar, exactly like the rolls which result from crushing rich gold quartz on an iron slab under an iron muller.

THE new reservoir of the Contra Costa Water Company is distant 2½ miles in an air line from the City Hall. It will be completed before the next rainy season. About 130 men are now engaged on the work of excavation. Many more will be employed shortly. The reservoir and pipe connections will cost \$350,000.

THE soda famine in England is likely to start up operations on the shores of Great Salt Lake.

MINING SUMMARY.

The following is mostly condensed from journals published in this interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, April 26: About 20 miners were started to work last Monday, operating three machine drills, preparing to open stopes. It is understood that the force will be considerably increased about the first of next month. The work now being done is with the view of getting the mill started at the earliest possible moment. The rock-breaker is not up yet; but the roads are rapidly getting in shape to admit of an effort being made in that direction at an early date.

GARDNER.—This property continues to develop very satisfactorily. The ore that has lately been taken from the tunnel shows abundance of sulphurets and some free gold. Robert Stevenson and two other interested parties from San Francisco paid a visit to the claim a few days ago, and were much pleased with the outlook. The rock in sight is said to be sufficient to keep a large mill running for years. There is little doubt that the parties will redeem the bond when it becomes due, if not before. There is renewed talk of building a mill this summer.

NOTES.—The Plymouth Consolidated is running 20 stamps steadily. At the New London, things are moving along very steadily and quietly. Several cleanups have been made, but the yield is not generally known. There is little reason to doubt, however, that the property is paying very well. Reeves mill, between the Cosmopolitan and New London, is also kept moving to its full capacity, but the surrender of the ore is likewise kept locked up in the breasts of the few who are in the secret. At the Cosmopolitan two tunnels are being driven in a northerly direction.

Calaveras.

GOLD BY THE POUND.—*Prospect*, May 23: Judge Ira H. Reed was the recipient from his mine at Central Hill on Monday last of a pan of coarse gold weighing 123 ounces. One nugget was valued at \$18 and dozens ran from \$1.50 to \$2.50 each. The total value was \$2149.40.

WEST POINT.—*Cor. Calaveras Chronicle*, April 26: In order to show outside capitalists and mining men the resources of the West Point mining district, I will mention some of the properties. Starting from the Kelt mine, owned by Peasley & Co., who have a ledge of high-grade ore about four feet in width, running from \$15 to \$75 per ton, we go south about one mile, when we come to the Hall mine, from which there has been taken thousands of dollars. Next come the John Henry, Modoc, Wide West, Tucker, Bartolia, and the Blazing Star, which is now in operation again. Then there is the Tom Payne, which is taking out some very rich ore, as also the old Lockwood, which has turned out fabulous wealth and is still good, with a 10-stamp mill and a full force of hands. Then comes the Scorpion, a valuable piece of mining property, which is bonded to San Francisco parties. There is a five-foot ledge of good ore and a five-stamp mill. I may as well embrace one or two of our poorest mines, such as the Champion, which has turned out a small mint of money, and to-day would be one of the best claims in the State if properly worked. Then going from the Champion in a northwesterly direction about two miles, we come to what I predict to be one of the richest mines in the State, known as the Lone Star, owned by Eastern capitalists and superintended by G. L. Brown. The mine is worked through tunnels. I heard from good authority that in the lower tunnel, the ledge was over nine feet in width from the foot-wall to as far as they had worked toward the hanging-wall, the latter having not yet been reached. The ore is of a high grade and the lead is pronounced by good judges to be one of the richest and best in the country. The company has a 20-stamp mill which is kept running night and day. We are expecting to see the Riverside start up shortly. San Francisco parties are at present negotiating for the property. It is only a short distance from the Lone Star and is a good mine. The smelting works are in operation and are doing good work. They talk of enlarging the works right away. This is a good thing for the mines here, as it does away with shipping the ore to San Francisco, which takes nearly \$50 a ton off from the rock. They have a fine method of working sulphurets.

El Dorado.

GRIZZLY FLAT.—*Cor. Mountain Democrat*, April 25: The gravel miners are jubilant over the bountiful supply of water and are ground-slucing and hydraulicking. The quartz business is at a standstill and unless a move is soon made in this direction there will be a dull summer for Grizzly. There was some hope of the Melton starting up, and Mr. Stanley has been expected up for that purpose, but he does not put in an appearance. Unless he does, the mine is apt to lay idle. Capt. Smith, the veteran miner, is doing his best to develop something in the Mt. Pleasant. He is working the drifts day and night, and, as industry deserves success, I think he will have it. Companies cannot expect to make a success of a mine unless they work for it, and cannot sell unless something is in sight.

Nevada.

THE WASHINGTON MINE.—*Transcript*, April 27: Gratifying reports continue to come from the Washington mine at Ormonde. The 300-level south has gone into the pay chute a distance of 200 feet already and the face of it is in ore. The ledge fills the entire drift, showing it to be more than seven feet thick, and the quartz is the best yet found in the mine. Shaft No. 2 is being sunk and will be continued downward 300 feet before stopping. The capacity of the 20-stamp mill is to be increased to 20 stamps more, and new and heavy hoisting works are to be erected over the main shaft soon. A sawmill will also be put up this season by the company.

BANNER.—*Tidings*, April 25: The new shoot of rich ore in the Banner is 200 feet in length, extending from a point in the tunnel to beyond the lowest workings in the shaft. The outlook for a profitable, permanent mine is brighter now than ever before.

NORTH STAR.—*Supt. Abadie* informs us that the water will be out of the 1600 level by Monday evening and the mine cleared within three weeks. A full force of men is at work, that is, a force sufficiently large to keep the 40-stamp mill running steadily.

A TENDERFOOT'S MINE.—*Tidings*, April 26: A year or more ago a San Francisco printer named John Tilton, a young man, prospected for cinnabar at a point on the North Bloomfield road near Edwards' crossing. He was bamboozled into prospecting for cinnabar, but he struck a 90-foot ledge of quartz. Mr. Tilton was in town to-day looking for a mill of from two to five stamps, to place on his mine. He brought down 300 pounds of unassorted ore, which was crushed at Frank Johns' mill and yielded (according to Mr. Tilton) \$1 in gold and 150 pounds in sulphurets. From ten pounds of sulphurets obtained from 25 pounds of ore some months ago, Mr. Tilton says he received \$17.50, and the sulphurets now on hand is richer in appearance. The mine is known as the Cleveland and the workings on the ledge are in about four and one-half feet. The South Yuba river runs near by, thus providing water for power. If Tilton is not misleading himself (he declares that he has not tested his best ore and that the cleanup to-day was not complete), he evidently has a bonanza.

CROWN POINT MINE.—*Grass Valley Union*, April 26: Appearances are favorable for a strike of rich ore in the Crown Point mine, as within the last few days the slate cap that is found on the hanging-wall of the 400-foot level has been showing small stringers of quartz that are rich in free gold. No well-defined vein of quartz has yet been found, but it is likely to come in at any time from these indications. The ledge may come in on the hanging-wall, where it was found in the levels above, or it may be in the foot-wall that has not been opened upon yet. The stockholders in the new company are feeling much encouraged at the prospects.

EUREKA DISTRICT.—*Cor. Nevada Transcript*, April 26: In your paper of April 12th I saw a communication from J. T. Wickes, on mining in Washington district. In that letter he makes a statement that should be corrected. One would think by reading his letter that all the mines that he mentioned were in Washington district, when five of the quartz mines referred to are in Eureka district. Other correspondents from Ormonde and Washington to Nevada City papers have done the same thing. For the benefit of the Washington correspondent I will give the locality where those mines are situated, so all can refer to the map of Nevada county and see if they are writing about mines in Washington district. In section 35 are the Lucy, Rising Sun and Star mines. In section 34 are the Moore, Rainbow and Boston mines. The latter is owned by a company in San Francisco, and is in charge of Victor Fernbach, who contemplates building a mill on it as soon as he can get the machinery hauled in. They have good prospects in the mine. They worked a small force this winter. In sections 34 and 35 is the Baltic property. This mine has been idle the last year, owing to bad management, but there are prospects of its starting again this spring. In section 28 is the California. In section 21 are the Anchor, Erie, Dublin Bay and the IXL mines. The latter is owned by P. A. Campbell and a company of S. F., and is under the able management of Mr. Campbell. They work through a tunnel that runs in from the mill and that tunnel will give them 1000 feet depth on the ledge. They have had pay rock from the first blast. They will build an additional 20 stamps this summer. Mr. Campbell is now running the mill that he erected last fall. The ledge is 14 feet wide as far as they have run their tunnel, with prospects of being larger. In section 30 is situated the Spanish mine. There is also a belt of mining country north from the Baltic property. In section 22 is the Golden Ade, owned by parties in Sonoma county and under patent. This mine has good prospects. In section 15 are the Birchville, Iowa, Sweet and Blue Cloud. The three former were worked some years ago to water level and were good gold-producers. The Blue Cloud is a new mine that is opening up with good prospects. In section 16 are the Shepp and the Rocky Glen mines. The former is a small ledge but very rich, the last rock from it working \$54 per ton. The Rocky Glen is owned by the Hayward Co. There has been some hundreds of thousands of dollars taken out of this mine. It is the only mine in the district that has been sunk on below what could be tapped by tunnel. All of the mines mentioned are in township 18 N., Range 11 E., M. D. B. M. All of said township is in Eureka mining district. There are good roads connecting all the mines in the district with Graniteville. We have the best timbered and watered district in the State for mining purposes. We have two sawmills to supply all lumber that is required in the district.

Inyo.

DEFIANCE.—*Inyo Register*, April 26: Foreman Jas. McDonald has received instructions from P. Roddy, owner of the noted Defiance mine at Darwin, to push certain new exploitations in the mine to determine the extent of the known bodies of low-grade ore. This being determined, future operations involve the continuation of the Darwin water-works to the mine and probable placing of a rock-breaker, roller crushers and concentrators, the principle of which is being evolved out of the jigger process.

FISH SPRINGS.—McCarty's two arastras, near the old Bond place at Fish Springs, are running night and day. The ore assays in gold about \$20, and comes from the McCarty & Melone mine. Fuller & Irving are also with them. The mines are south of Fish Springs, across the spur of the Sierras which there crosses the valley.

UNION.—Work at the Union mine, Cerro Gordo, is being systematically shoved along. A Burleigh air-compressor and three Ingersoll drills are on the way to the mine, to drive on the 700 level of the new shaft for the Union ledge and for the continuation of the Santa Maria southward on the 387 level, under the Enterprise ground.

Placer.

THE MOORE MINE.—*Herald*, April 26: At the Moore mine they have started the steam pump, and expect to have the water out and be ready to commence extracting ore in a short time. This is one of the richest leads in the district. Heretofore the owners have done all the work that has been done. This year they expect to put on some extra men and work the mine on a more extensive scale.

THE HATHAWAY.—The Hathaway mine, south of Auburn ravine, a short distance below Ophir, G. F. Taylor, superintendent, is proving a substantial and profitable enterprise. They are working now about 40 men all told, and the 20-stamp mill is kept running constantly day and night. They are working now on the 250-foot level. The vein is

from two to three feet thick, all mill ore, and pays from \$8 to \$10 a ton. The mill crushes on an average about 40 tons a day. In addition to the free gold, they save about 1500 pounds of sulphurets a day, which assays from \$150 to \$200 a ton, and works from 90 to 95 per cent of its assay value.

THE VAN VATOR QUARTZ MINE.—Work is being vigorously prosecuted at the Van Vactor quartz mine, at Canada Hill. The great depth of snow materially delayed the erection of buildings, but the late fair weather overhead has enabled them to make excellent progress lately, and by the 15th of May all will be in readiness to start crushing ore. The almost insurmountable difficulties overcome by Mr. Van Vactor, the energetic young superintendent of the above mine, in the erection of the mill during the past severe winter amid snow from 25 to 30 feet deep, and in having everything in readiness to begin active operations so early in the season, reflects great credit on his administrative ability and demonstrates the possibility of mining to advantage during the severest winter in the high altitudes, when proper arrangements are made.

THE ECLIPSE.—Last summer a N. Y. Co. got possession of the old Eclipse quartz mine, located about two miles west of Auburn, and under the superintendency of J. B. Patterson, the former owner, has been busy at work ever since erecting hoisting works, a new mill and developing the mine. They have been delayed by the excessive rains of the past winter, but at this writing have everything running in good shape. The hoisting works and pump, 100 feet from the mill, are run by a 4-foot Pelton water-wheel, and are so complete in automatic appliances that one man receives the cars and attends to everything. The mill is one of the finest in the county. Between the hoisting works and the mill is an elevated railway, along which the cars are run and from which the ore is dumped into the large ore bin. The automatic appliances are here again so complete that the entire works of the mill are operated by one man. The machinery is all very perfect and works like a charm. The power for the mill is supplied by a 5-foot Pelton water-wheel. The company has expended for buildings and machinery about \$30,000. The vein varies in thickness from 20 inches to 4 feet, and is all mill rock. At the bottom of the main incline the ore is as good as any they have had, and a 60-foot drift extending on either side of the incline, at a depth of 250 feet, shows a strong vein and uniformly rich ore. When they started the mill they had nearly 300 tons of rock on hand, and expect with this start to keep the 10 stamps running constantly day and night. Seven hundred feet east of the present works a shaft has been sunk to a depth of 200 feet. A steam-hoisting plant is being put on this, and it will be connected to the mill by a track so arranged that the ore can be delivered at the mill by machinery. Connected with the works is an assay office which is conducted by Mr. J. W. Peck, who for several years was first assistant assayer at the U. S. Mint in San Francisco.

ECLIPSE.—*Placer Argus*, April 26: The new mill at the Eclipse mine is in operation, and flattering developments are being made in the mine.

San Diego.

GOLD KING AND QUEEN.—*Julian Sentinel*, April 26: T. W. Brooks, the mining expert, who visited Julian some time since to report on the Gold King and Queen and Cincinnati Belle mines, is again in the camp this week in company with Geo. Rhorer, president of the company, and Mr. Cushman and son, two of the directors. Their visit is for the purpose of perfecting plans for the extensive development of their fine properties.

Shasta.

REDUCTION WORKS.—*Redding Free Press*, April 26: Messrs. Parmlee, Good & Nort, mining men from Chicago, without saying much to any one, but upon a favorable report being made by Mr. Parmlee, who was here and investigated our mineral resources last winter, came to our city a week or so ago, and after negotiating for several pieces of property upon which to erect reduction works, finally purchased 16 lots in the Walden addition, below the works of Wm. Conant, which burned down last week, and commenced excavating for the purpose of erecting a building. Thursday the freight train from the north brought an engine and boiler and a pulverizer, which, as soon as the building is ready, will be placed in position. These men are making no great commotion, preferring to await the legitimate results of their enterprise; but sufficient is known to enable us to state that the plant is being erected for the purpose of dry crushing and concentrating the precious metals of all the ores found in this neighborhood, saving the free gold and freeing from the quartz the gold-bearing sulphurets. They do not propose to work these concentrates. The process is what is known as dry concentration. Their process has been tried successfully in Chicago, where they have a large plant, and they will be prepared to work the ores for so much a ton, or will purchase the ores outright.

OLD DIGGINGS DISTRICT.—*Redding Free Press*, April 26: The mining industry is progressing about as usual and the outlook is hopeful and encouraging. We do not join in the nonsensical "booming" of our mines as some districts do. There is a big future for quartz-mining in Shasta county, and there will be more prospecting this year than ever before, but any exaggeration or deliberate falsehood will hurt the county ten times more than it will do it good. The Hart & Fleming and Walker mills have been running very regular. Mr. Paul of the Calumet has returned and is getting ready to start up the mill. Pete Christenson is putting up a horse-power attachment to the cable transfer system of the Central mine connecting with Whitehouse switch across the river. Mr. A. B. Paul of the Calumet mine circulated a petition this week protesting against the abandonment of the Old Diggings and Redding wagon-road by the Board of Supervisors. Five or six years ago when this was declared a county road there was not a quartz-mill in the Old Diggings; now there are five and the road is an absolute necessity. It is in a deplorable condition and needs attention at once.

Trinity.

RIVER MINING.—*Trinity Journal*, April 26: R. M. Dodge of San Francisco arrived Tuesday and left Wednesday for French creek, where he will take charge of the financial side of the Lower Trinity company's operations in that neighborhood. The company intends to work the river-bed on a large

scale this summer. Times will be good in that vicinity.

TRINITY CENTER.—The weather has been very favorable for work in the mines for the past few weeks. Boss & McClary have been working a full crew of men on their ditch preparatory to opening up their mines for the season's run. A. P. Hanks has been running his claim for some time, and the China company has been running steadily almost all winter. Mining interests in this neighborhood have assumed a most encouraging prospect for the future, and a lively boom is anticipated in the neighborhood of the Cinnabar mines on East Fork, just as soon as the snow will permit of prospecting. The ledge discovered by E. Shumacher in the vicinity of the Cinnabar mines, and the third interest in which was recently purchased by Messrs. Grotefend and Reid, promises to be one of the best properties of the kind in this northern country.

Siskiyou.

CLEANUP.—*Yreka Journal*, April 26: Jos. Williams, who has been working a placer claim in Hi You gulch, a tributary of McAdams creek, cleaned up \$900 last week, after a short run, and has a very rich paying mine. A man named Smith, a Yankee genius in the matter of mining or any other skillful work, has been realizing good pay from the old Walker & Squiers ledge on Indian creek, which he purchased recently, and hauls the quartz to the mill near Hooperville. C. Schroeder, of the Schroeder & Werner quartz ledges on head of Deadwood creek, is now busily working a force of men, in getting ready for operations in mine and mill, just as soon as the snow melts off sufficiently to start up. Being high up in the mountain, the snow is quite deep, though melting rapidly from the mild weather and warm sun lately. Nort Hawkins and S. Billips, who have been working some old tailings on Greenhorn creek, below the old Lige Clark claim, took out a large amount of coarse gold dust last week, the adobe in the tailings, which had never been washed, being rich with gold-dust.

Tuolumne.

TUTTLETOWN.—*Tuolumne Independent*, April 26: Messrs. R. Coughlin and J. Holmes are having a fine prospect in their mine, on Jackass Hill, Tuttletown, with flattering indications of a large pocket soon. Quite a mining boom seems to have struck Tuttletown lately, as there are more men to be seen prospecting in that vicinity, at present, than there has been for over 30 years. Messrs. Henry Eckel and James Kerr of Springfield took out a fine pocket from their mine, near Tuttletown, on Friday of last week. The exact amount we are unable to state. This mine is leased from Antoine Vincent, and we hope Messrs. Eckel & Kerr will now receive a merited reward for their energy and perseverance in developing the mine.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Chronicle*, April 26: On the 630 level a southwest drift is advanced 382 feet from the shaft station, continuing in a porphyry formation carrying water.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 315 feet, passing through one foot of clay into porphyry.

MEXICAN.—On the 1465 level west crosscut No. 4, 100 feet south of No. 3, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 172 feet, continuing in porphyry carrying lines of quartz.

OPHIR.—On the 1300 level in working southwest-erly from the top of the raise carried up 28 feet above the south drift from the end of the east crosscut from the shaft station, following the ore streak found in the raise, 37 tons of fair-grade milling ore were extracted and raised to the surface, the average assay value of which is \$25 per ton.

CON. CALIFORNIA & VIRGINIA.—No discovery of new bodies of ore has been made. During the week extracted 2896 tons and 1820 pounds from the above-mentioned points. Shipped to the Morgan mill 1734 tons and 1850 pounds of ore, and to the Eureka 1767 tons and 1970 pounds; battery sample assays showing an average value of \$21.68 per ton. Bullion valued at \$13,387.13 shipped to the Carson mint. Bullion valued at about \$12,000 on hand in local assay office.

BEST & BELCHER.—On the 1200 level the north drift is cleaned out and repaired 623 feet.

GOULD & CURRY.—On the 400-level west crosscut No. 1 is extended 605 feet. Formation, hard porphyry.

NORTHWESTERN CON.—Shaft down 20 feet below the 100 level.

ANDES.—The 420 level west drift from the shaft station is advanced 92 feet, and continues in porphyry, clay and seams of quartz.

SAVAGE.—Shipped 445 tons of ore showing an average value of \$23 per ton by battery sample assays. Bullion on hand valued at \$27,334.56.

WARD COMBINATION SHAFT.—Resumed extension of drift into Julia Con. ground.

CHOLLAR.—Extracted 451 tons of ore, battery sample assays showing a value of \$22.45 per ton.

POTOSH.—On the 930 level the winze is down 75 feet. In the bottom are streaks and bunches of ore giving good assays. The raise above that level is up 108 feet and has passed through the quartz and is now in porphyry.

ALPHA.—The 600 level east crosscut is in 32 feet and continues in porphyry. The 600 level south drift is out 38 feet, face in porphyry.

EXCHEQUER.—The 600 level north drift is out 245 feet, and continues in quartz and porphyry.

CON. NEW YORK.—The 650 level west drift is in low-grade quartz. The 960 level south drift continues in low-grade quartz.

IMPERIAL.—The 500 level north drift from the west crosscut is out 165 feet and continues in porphyry.

YELLOW JACKET.—Shipped 400 tons of ore showing average assay value of \$21.75 by battery sample assays.

CROWN POINT.—Shipped during the week 860 tons of ore, showing an average value of \$19.33 per ton by pulp assays.

KENTUCK.—The winze below the 950 level is still in ore.

CONFIDENCE & CHALLENGE.—The 850 level west crosscut No. 1 is in low-grade quartz.

HALE & NORCROSS.—Shipped 1057 tons of ore during the week, showing an average value of \$21

per ton by battery sample assays. Bullion on hand valued at \$35,536.90.

BELCHER.—The 300 level west crosscut is in 100 feet, the face in quartz and porphyry.

SILVER HILL.—The 260 level northeast crosscut from the northwest drift continues in clay and porphyry. The 160 level south drift is in vein matter.

SEG. BELCHER.—The 85n level Belcher joint crosscut continues in quartz.

JUSTICE.—During the week crushed 217 tons of ore showing a value of \$29.36 per ton by battery sample assays. The raise above the 622 level is in low-grade ore. The winze below that level is in good ore.

ALTA.—The ore output this week was 425 tons, showing an average assay value of \$23.75 per ton by pulp assays.

OVERMAN.—Shipped 303 tons of ore during the week, showing an average value of \$17.77 per ton by battery sample assays, of which \$10.40 was gold. The northwest drift is in low-grade quartz.

UTAH.—On the 725 level west drift is advanced 92 feet from the shaft.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels.

Sylvania District.

FURNACES.—Inyo Register, April 26: The Sylvania boom has given a new impulse to Big Pine. Crocker Bros. have purchased an interest in the mines. The new road through Ashmore's pass was finished last week. Denny Hession has the Sylvania coal contract, and left a few days since with provisions, tools, etc., to begin work. George Hall started two 6-animal teams from Big Pine Saturday, loaded with lumber for the company's buildings. The machinery for the furnaces is expected down this week. No one need expect to hear of a full force of men being put to work in the mine for a time yet, as the intention is to get all preliminary work done before putting on a full force. Then mining begins in real earnest. The works, boarding-house, etc., will be in Inyo, while the mine is over the State line. Ben H. Yandell will be the company's clerk.

Tuscarora District.

NEVADA QUEEN.—Times-Review, April 25: North gangway from 600-foot station of North Belle Isle has been advanced 25 feet.

GRANO PRIZE.—500-foot level—Face of east drift on north vein extended 11 feet, and west drift 10 feet, without change.

NAVajo.—East crosscut from the north gangway, 350-foot level, extended 12 feet; the face is in bard rock.

BELLE ISLE.—South drift from the crosscut, 350-foot level, extended 9 feet, showing considerable high-grade ore.

NORTH BELLE ISLE.—The work above the 300-foot level continues about the same. In making the air connections, streaks of good ore are found through the concentrating ore. North gangway from the shaft on the 600-foot level has been advanced 25 feet. The rock in the face is getting harder, and shows seams heavy with iron. The water is beginning to show considerable pressure.

NORTH COMMONWEALTH.—Second level—Joint crosscut has been extended 16 feet, cutting spar seams and water. South drift has been extended 27 feet, total 57 feet.

DEL MONTE.—Second level—Joint crosscut east has been extended 16 feet, and is looking much more favorable than when last reported.

COMMONWEALTH.—The mine has been retimbered wherever required, and is in good condition. We have borrowed timbers from Grand Prize and North Belle Isle, so the mine can be kept all right until more can be obtained. Concentrator running all right; about 300,000 pounds concentrates on band.

ARIZONA.

MILL.—Mohave Miner, April 26: The Rattan-Ruth Mining & Milling Co. are making preparations to erect a mill on the Colorado river, near their mines. They have their mines well developed and a good many tons of rich ore on the dump awaiting the building of reduction works. The Atlantic M. Co. closed down on the Dean mine for the present. After a run of a few weeks it has been satisfactorily demonstrated to the company that a sufficiently high percentage of the silver cannot be extracted from the ore without roasting. Concentrators will be put in as soon as possible, and a roaster at no distant day. J. M. Dawley, formerly superintendent of the Atlantic Mining Co., has severed his connection with that company in order to more fully devote his time and attention to the erection of the 15-stamp mill, concentrators, etc., now being built on the O. K. mine, in Gold Basin. Beebe's teams left this week for the Basin to haul the machinery, etc., for the mill.

PLACERS.—Prescott Journal-Miner, April 23: About 20 Mexicans are camped on Big Bug, engaged in placer mining. They work on the co-operative plan, and wash from \$3 to \$5 per day to the man. Joseph Howell recently sold five claims in Santa Maria district for \$77,000. The purchaser is Martin Lewis, the Colorado mining man. He has also purchased machinery to put on the properties, and will at once commence active development. Black Canyon creek, near Gillette, is evidently gaining in reputation as a placer-mining center, judging from the number of miners who have been washing gravel there during the winter. In most cases good wages have been made. A party of three miners are successfully working the Kimball mine on Lynx creek, and astraining the ore, which pays from \$40 to \$60 per ton. This is the property on which Geo. W. Curtis, deceased, erected a mill and soon afterward abandoned. In the vicinity of Sycamore creek, near the Verde, the Alexander boys recently discovered a mine which, if it should hold out as well as surface indications show, will make them wealthy. This section is unprospected, the ruggedness of the mountains and its comparative isolation making it somewhat uninviting to the prospecting fraternity. The Boggs and Hackberry miners, on Big Bug, are as active as usual. In the former the main shaft is down 200 feet in good ore, while with the latter the character and richness of the rock is such as to make it among the big mines of the county. About 60 men are employed in both mines. Both the north and south drifts in the Black Horse mine are being pushed as rapidly as possible. The north drift is in good ore all the

way, while at 30 feet in the south one the best ore yet found in the mine was encountered. General Manager Carlisle and his superintendent, Robert Cartmell, are both elated at the rich development in this property, both in the shaft and the drifts.

THE REYMERT MINES.—Florence Enterprise, April 26: Very few people residing in Pinal county possess an idea of the magnitude of the work accomplished at the mines of the J. D. Reymert Mining Co. during the past year. Judge J. D. Reymert, president of the company, was in Florence this week, and he gracefully acceded to the request for information relative to the progress made under the new management. Judge Reymert said: Since April 1, 1889, the sum expended in improvements, enlarging the capacity of the mill, machinery, buildings and explorations in the mine, was about \$160,000, of which \$75,000 was derived from a voluntary assessment and the balance from the product of the mines. We have increased the roasting capacity from 20 tons to 65 tons in 24 hours and have all the machinery necessary to treat that amount. Up to March 1st, the mill had run but 160 days of 321, owing to the deficiency in the water supply. The mines are worked upon the same system as previously, that is, they are timbered wherever the ground is soft or unsafe. We are following the fissure, which appears to be continuous, the whole length of the seven claims—nearly two miles. Between May 1, 1889, and March 1, 1890, there was milled 3348 tons of ore, which netted at the San Francisco mint \$60,432. This is not a fair criterion of the yield, in consequence of the difficulties we had to contend with; the construction of new improvements and stoppages. We have a store with an ample supply of goods, and have built a pump station below the mill to return the water after being once used. We save nearly 90 per cent of the value of the ore at present and the tailings assay from four to five ounces in silver. Our superintendent is a very capable man and displays remarkable energy and a due regard for economy in the matters under his charge. The mine is a great property and will eventually become a large and steady bullion-producer.

COLORADO.

THE SILENT FRIEND.—Aspen Times, April 25: The developments in the Silent Friend mine at Pitkin attract much attention in Aspen on account of the fact that Aspen people are interested in that property, while many other claims in that district are owned here. The ore chute is opened at two points about 40 feet apart, the lower development being about 140 feet below the bottom of the old stope. The main drift has been driven into the ore about ten feet. The ore body appears to be from four to seven feet in thickness; and there seems to be no reason to doubt that a great bonanza has been opened. About 700 tons of mineral has been extracted since the discovery was made and shipments will be immediately begun. Manager Murphy, who has just returned from the property, estimates he will soon be able to output from 25 to 50 tons per day. The most interesting feature of this development is the high-grade character of the ore. A large number of assays have been made and the lowest return so far received has been 80 ounces silver, with the highest running up to 400. The lowest percentage in lead found has been .45, while some of the assays have indicated 72 per cent in this metal. It is believed that the entire ore body will average close to 200 ounces in silver and about 50 per cent in lead.

THE HUNTER PARK CO.—Important developments are expected soon in the shaft of the Hunter Park Mining Co. This shaft has now reached a depth of 600 feet and is still in the silicious shale. It is thought that the blue lime will soon be reached, which is probably about 30 feet thick at that point. The flow of surface-water has necessitated a No. 6 Cameron pump being placed on the property. A station has been cut 475 feet down the shaft and all the water will be collected there.

NORTH STAR STRIKE.—An important strike is reported in the North Star, the new discovery in the south workings of the mine. H. E. Walker, the manager, says they have two and one-half feet of 125-ounce ore. The strike was made last Sunday, and has been gradually improving. The ore appears to be a chimney, but may be a regular chute. About eight tons of the mineral has been extracted ready for shipment.

DAKOTA.

ORO FINO.—Deadwood Pioneer, April 22: After a long and exasperating series of delays, which no amount of foresight could have avoided, dirt from the big cave is again being hoisted at this mine, but the most diligent inquiry fails to elicit anything concerning the intention of the company now prospecting the mine. It is whispered upon the street that the diamond drill core has been very disappointing, but of this no one really knows anything definite save the superintendent and his assayer. The only thing really not guessed at is that the bump tablets are doing fine work, saving all the pyrite, rusty gold and escaped amalgam.

MILLER SMELTER.—A new coke-house holding ten carloads of coke has been completed, and the Northwestern Transportation Co. is now delivering coke at the works. Dr. Carpenter has bargained for 400 tons of ore. The machinery has been traced to Chicago, and left there upon the 11th. It should soon be here. The company will buy all ores offered no matter what their character, always provided they carry gold and silver enough to pay for treatment.

PLENTY OF ORE.—Deadwood Pioneer, April 28: When the baby experimental plant was built, and the announcement made that it was to be replaced by a smelter of 250 to 400 tons capacity, the corporation's guard of cranks who survived the war of extermination inaugurated against them by representative people of the Hills, exclaimed, "Oh, what a force! Why, they can't get 20 tons of ore per day; how will they supply a 400-ton plant?" Dr. Carpenter, who will have the management of this big plant when completed, is in the best of humor at the situation. To a Pioneer reporter he stated a few days since that he sees his way clear to all the ore he wants. "In fact," said the doctor, "what is bothering me now is to get a plant big enough to treat the ore offered. Ruby Basin, Bald Mountain, Galena, Strawberry, Spruce Gulch, Carbonate,

Squaw Creek, or any of them can supply a good deal more than I anticipated." Representative mining men, to whom the statements were subsequently made known, verified them, adding that six months ago it might have been difficult to supply 400 tons of ore per day. The unquestionable success of pyritic smelting, however, and the knowledge that it can be applied at living rates has so stimulated industry that in the opinion of many, the mines of the districts named can now easily supply double the quantity to keep a 400-ton plant busy. The Hills are not half prospected, either.

IDAHO.

MINING ACTIVITY.—Boise Statesman, April 22: Great attention will be directed during the summer to the quartz mines in the vicinity of Boise and in the Boise Basin. Investors who have never visited these productive and interesting regions should do so this summer. Their journey in the mountains will be found of surpassing interest. The scenery is grand and beautiful, the mountains rich in minerals and timber. The failure of Silver Mountain has dampened the ardor of English investors, but no resident of Boise City or Ada county can be blamed for that failure, as everybody wells knows, and every miner whose judgment was worth a farthing always asserted that there was absolutely nothing in Silver Mountain. On the other hand, the most experienced miners in the country claim and have always claimed that the richest gold-bearing lodes in Idaho would be found in the Boise Basin. The history of the huge fiasco in Silver Mountain would be doubtless interesting to our English cousins, and some day when time permits we may unfold to them a tale which will prove how innocent and glibly a Briton can be.

MILL RUNNING.—Silver City Avalanche, April 26: The DeLamar mill is running right along as usual, grinding out the precious metals from ore out of the Wilson mine. The mine furnishes a constant supply, and could keep three or four mills, just like the DeLamar mill, running constantly the year round for an unlimited period. Soon the tramway will be ready for conveying ore from the mine to the mill, which will materially reduce expenses, and will allow the energetic owner of the property a clear profit on \$5 ore. Capt. DeLamar has demonstrated that low-grade ore can be worked, although the ore that he mills from his mine averages well. Everything about DeLamar now presents a lively appearance, which indicates that the mines are paying.

BLACK JACK.—Supt. E. H. Dewey informs us that the crosscut being run to cut the Black Jack and the Empire State lodes struck bard rock which lasted for a few feet, and then entered ground that now needs timbering. The crosscut is in over 400 feet, and is progressing as well as the character of the ground will permit.

LOWER CALIFORNIA.

THE BIG RUN OF AURORA ORE.—Lower Californian, April 24: Things are certainly lively at Alamo. Col. Lane's mill has been running night and day for six weeks. The Princess Co. and the El Paso Co. are in full blast, the latter company having developed enough high-grade ore in the Elsinore alone to keep the mill busy. Col. Kern's mill is getting ready as rapidly as possible. At Mexican gulch unfortunate litigation has kept the Lucas mill shut down, but Col. Lucas, through the opportune sale of a Colorado mine, is healed, and says he will fight to the bitter end. A. H. Butler is making arrangements to run his mill. Two runs of Aurora rock were put through Lane's mill recently. The first lot of 25½ tons netted \$55.44 per ton, and the second of 5½ tons netted \$145 per ton. No further proof is needed to show that the owners have a bonanza in this mine. J. M. Gonzalez, who owns an interest in the Aurora, has also leased the Placer mine from Crosthwaite and Lopez, and put men at work developing it. Thomas McManus has received a concession from the Government to prospect and work mines of all kinds and gold placers on Cedros Island. This will not conflict with the rights of the Cedros Island Mining Co. nor of the Land and Colonization Co. Capt. Baines, vice-president of the El Paso M. & M. Co., is interested in the concession for his company. A prospecting and exploring party will be down in a week or ten days to explore the concession. Ex-Gov. Ryerson, president of the San Nicolas M. Co., has made arrangements to re-open the mine on a sound financial basis. A. Morales has disposed of his shares, and several Eastern capitalists have become interested in the property. The other mining interests in the vicinity of the Real are going ahead.

MONTANA.

ROCKET DISTRICT.—Anaconda Review, April 25: Much activity is manifest among the mines of Rocket district, near Wickes, and many properties are being developed with splendid results. The Bennet and Bender, Uncle Sam, Cierivas, and several other mines in this district are making an exceptionally good showing, and in some of them large ore bodies are said to have been uncovered. Shipments of ore have been made from the Bennet and Bender, and in the 125-foot incline shaft sunk on the Uncle Sam a large body of galena ore carrying gold, silver and copper has been exposed.

CLARK'S PURCHASE.—Phillipsburg Mail, April 26: The Agua Frio group of mines in Beaver Creek district passed on the 7th inst. to Charles Clark, one of the principal owners of the Granite Mountain and Bi-Metallic, the consideration being \$75,000. With the Agua Frio's development and guaranteed productiveness, mining men are of the unanimous opinion that Mr. Clark has secured a bargain. Under the ownership of Hazelton and Harris of Helena, the mine produced over \$250,000, and has netted the owners quite \$10,000 per month for several months past, and as they now have \$75,000 as the purchase price, they, too, are to be congratulated. Under its new ownership the mine will be subjected to an elaborate system of development, and is destined to become one of the famous producers of Montana.

GRANITE MOUNTAIN.—The output for the week ending April 24th was 55 bars of bullion, containing 87,240 ounces fine silver and 171 ounces fine gold.

THE ALICE CO.—Inter-Mountain, April 26: The Alice is working a full force of men at both the

Alice and Magna Charta. Sinking continues at the main shaft of the Alice, now within 10 or 15 feet of the 1300-foot level, which will be reached by Tuesday. Sinking will then suspend for the time being, and the mine will be developed below the 10. Two Burleigh drillers are already at work on the 1000-foot level, although no development of importance has yet been made. Sinking progresses at the Blue Wing, and the shaft is approaching the 400-foot level. All 80 of the Alice stamps are dropping steadily, and silver at \$1.05 means a big difference for the Alice people, and a long vista of prosperity opens up before them.

AT THE SILVER BOW.—The miners at Silver Bow shaft No. 1 laid off yesterday, and the work of removing the old engine to shaft No. 2, just west of the Silver Bow mill, was begun. This shaft, which was started last summer by the company, is now 300 feet deep, and a crosscut has been started which will connect with the 400 of shaft No. 1. The old engine at Silver Bow shaft No. 1, will be set up at shaft No. 2 at once and sinking will again be resumed. The cages were put in shaft No. 2 yesterday. The Butte & Boston reduction facilities are inadequate, as the mines are capable of producing vast quantities of ore. The Silver Bow mine is looking as well as ever, and is undoubtedly capable of becoming one of the greatest copper properties in the world.

NEW MEXICO.

DOS CAÑEZAS.—Silver City Enterprise, April 25: The 15-stamp mill at Dos Cañezas began operations Tuesday, and that camp will again be classed with the bullion-producers. Harry Fowler is working mining claims No. 1 and No. 3 in Camp Velines. He has on the dump ready for shipment several tons of ore which will run 45 per cent lead and 20 ounces in silver per ton. He is trying to concentrate his second-class ore in the Bremen mill. Jack Fleming and Hank Dorsey shipped 7½ tons of high-grade ore from the Chamberlain mine last week to the Socorro smelter. The Chamberlain is in Stonewall district about three miles from the line of Old Mexico and but a short distance from Carrizillo springs. They have uncovered besides their high-grade ore a body of free-milling ore over 20 feet in width, which assays \$25 per ton.

The strike on the Alhambra continues to grow in magnitude. Since the last issue of the Enterprise the drift on the 100-foot level, where the rich ore was discovered, has been driven 14 feet, making in all 34 feet along the apex of the ore body, and it still shows as strong in the face of the drift as at any point. The owners have sacked and ready for shipment 2 tons of first-class ore, which is estimated to be worth from \$6000 to \$8000 per ton.

OREGON.

ROBINSONVILLE MINES.—Baker City Democrat, April 28: A visitor in our city for a few days is Mr. B. L. Duncan, who for the past winter has been engaged on a contract of tunnel work on the Strausburg mine, owned by Frank Clarno and others of Portland, and situated between Granite creek and Robinsonville. The Strausburg has been developed the past winter to the extent of a 100-foot tunnel, in running which two splendid ore veins were cut, and from which good free gold prospects were obtained, the highest assay being \$87 from ore sent to Portland. Graham Bros. have done good work this winter on their property and a good showing has been made. Their tunnel is 11 feet high and 10 feet wide, the width of the ledge. A rich strike was made a few days ago in the Berry mine, and gold specimens are being taken out by the handful. The Hidden Treasure, owned by Hayes & Co., has been extensively developed the past winter and makes a fine showing. Other properties have had more or less work done on them, but the heavy snows of the winter have greatly interfered, and this obstacle has not yet been overcome.

UTAH.

ORE ON GODEVA MOUNTAIN.—Eureka Chief, April 25: Ore was struck Saturday on the Godeva group, on the further side of the Godeva mountain, about a mile or a mile and a quarter southeast of town. The Godeva group is patented ground, and owned by a company, the principal members of which are J. Q. Packard, John McChrystal and C. C. Goodwin, editor of the Tribune. The strike will be developed as rapidly as possible and Godeva mountain will hereafter do her share toward making this the best camp in the country. There are other fine claims on this mountain, and this strike will doubtless give the owners confidence and cause work to be pushed with renewed vigor.

A STRIKE IN THE VICTORIA.—Saturday evening a body of ore, of the same character as the Eagle ore, was struck in the Victoria shaft in Eagle canyon. The Victoria is adjacent to the Eagle and is owned by Noab McChrystal and N. D. McLeod. W. R. Wallace recently sold a third interest in this claim to Noab for \$5000. The boys expect to develop a large body of ore and feel jubilant over their good fortune.

CAMP CROSSCUTS.—Park Record, April 26: The Union and also the Crescent concentrator will soon resume work for the season. The Ontario bullion shipment for the week was 30 bars, containing 15,692.45 fine ounces of silver. It is expected that Contractor Dull will get his rebuilt boring machine at the Aochor shaft in operation the coming week. Only one man is working at the Creole No. 2, pending the settlement of certain important negotiations between the owners and lessees. The Ontario gulch road is now in condition for ore-hauling and during the week about 320,000 pounds of Ontario ore was sent to the Mackintosh sampler for shipment to the smelters. Ore-hauling from the Mayflower No. 7 leasers' mine has been resumed, and the Woodside, Daly, Alliance, Nevada-Northland and others will follow suit with big ore shipments just as soon as the wagon-roads get in better condition. Several jigging outfits are being put in working order from below the Union concentrator to a point near the lower depot, and they will be the means of converting lots of waste into a marketable article that will be shipped to the smelters.

MECHANICAL PROGRESS.

Recent and Needed Patent Improvements.

The steam hammer has given such perfect results in the cushioning effects of steam that a substitute in the form of compressed air must be employed where other motive-power than steam is used.

There is quite a tendency among inventors and mechanics to bring into use the driving effects of hydraulic power whenever a steam plant is to be called upon to operate the machinery, and the mill privilege, with its never-failing steam, must be utilized in compressing air that the machinery may have some of the expansive benefits that are to be found in the steam engine.

The exhaust from a steam boiler should step right back into the boiler as readily as if the engine was simply an exhaust injector, and the unite of heat that pass up the smoke-stack should be dispensed with at once by firing up the plant on the principle of the soda engine. It would seem quite easy to construct a boiler with the fire-box in the same compartment with the steam-room, and the fuel as well as the draught supply pumped in with the feed-water, and allow the engines to make use of all the gases, as well as the mechanical union of heat and water, known as steam. If fears are entertained for the air-pump when the condenser is in use, a highly hydrogenous fuel should be used, which will leave the greater part of its own product of combustion the same as that obtained by evaporating the feed-water.

Where a battery of boilers are kept under fire, the engine must keep a set of pumps at work that the freight as well as the passenger elevator may be driven by hydraulic power. Speaking of boilers, how an inventor must shake his head when he examines the amount of waste found in a modern steam plant, and what a wonderful chance there is for an improvement. Will some inventor take notice?

We shall expect before long to find in the list of patent improvements a substance or a compound ground up and sold in the form of corn cakes that will disintegrate spontaneously, similar to sky-rocket powder, which will only need to be thrown into a soda-tank to supply an engine with driving-power for ten hours.

A novelty in the manufacture of steam pipes consists in the fact that a core of some kind has been invented which may be thrust through a mass of melted steel after it has been poured into the mold. The utility of such a device goes without saying.

A machine has been devised that separates quartz sand into different grades from 4 to 60 by simply allowing the sand to drop or rain down on to a revolving cylinder. Every grain receives the same velocity when it leaves the cylinder, and the simple resistance of the air effects the separation—so it is claimed.

The Hammer's Many Crimes.

The hammer is an ever-present tool. It is found on every work-bench. No kit of tools, however small, is of any value without a hammer. It is found in every household, in every shop, in every place where work is to be performed. We cannot do without the hammer; but it is guilty of many crimes, especially when used by an unskillful or careless hand. A correspondent of the *Blacksmith and Wheelwright* recounts many of its false moves, and suggests remedies therefor. We copy as follows:

The ever-present hammer. How many its crimes! The body-maker carelessly lets it strike the panel when driving in a nail, or perchance he uses it to set a closely-fitted panel or piece of framework. The wheelmaker thinks nothing of topping the fellow with its hard face, and should be forget or neglect to do so, the blacksmith makes good his oversight. It's only a little bruise, the paint will cover it. But will the paint cover it? There's the rub. The paint may cover it; but it is bound not to remain covered, and soon the would-be-hidden injury appears in a condition more decided than when first inflicted. A knot, a plug, or even a panel check may be hid, but not a hammer mark; and yet the latter is a fault common in almost every carriage factory.

A hammer mark differs from other injuries, owing to the fact that the fiber of the wood is broken and disintegrated, and those nearest the surface are either severed at the edge of the hulse or they are stretched and forced down; if broken short off, the injury is more easily overcome than when elongated.

The first act toward repairing the evil is to moisten the wood. Hot water is the best, as it penetrates more quickly than cold. Enough should be applied to penetrate to the bottom of the bruise, then allow the wood to remain undisturbed until thoroughly dried out, after which cut off the raised wood with a sharp chisel and fill in with oak or silex mixed to the consistency of putty with linseed oil, being careful to level off before the mixture has hardened.

When the edges are not broken, cut across the grain with a sharp chisel, removing a little of the wood, then wet as before and treat it in like manner with the composition. It is needless to try to fill up the broken wood with common putty, as it will be sure to shrink and leave an uneven surface. The silex, however, makes a filling that effectually resists moisture,

or the action of oil or turpentine. When wood has an open grain, and for hriees of a minor character, the body-maker, or rather the carriage-builder, will find it profitable to moisten the surface with warm water, and after the moisture has thoroughly dried out, clean off the raised grain with a sharp scraper; then fill the grain with a mixture of silex ground in oil, and thinned with turpentine, apply it with a coarse brush and rub off with curled hair within 15 minutes after the material is applied; if allowed to stand too long it will harden and much labor will be required to level it. If silex cannot be procured the next best material is cornstarch passed through the paint-mill with enough linseed oil to make a pasty compound; thin down with turpentine before applying.

Bruise on the hard wood of rime and axle beds are more troublesome than those of soft wood, but they can be treated to an advantage by following the course we have recommended; but it is best to fill the grain with the silex mixture reduced as thin as varnish, as a thicker mixture would not penetrate far enough to be of any service.

THE COLORS IN TEMPERING IRON.—A writer in a technical cotemporary says: "The cause of the production of these colors is now universally acknowledged to be the formation of thin films of oxide on the surface of the metal when it is heated in presence of air. Even this question was at one time in dispute, such men as Davy and Thomson taking the opposite view. But Davy afterward showed that steel might be heated in a neutral gas, such as hydrogen or nitrogen, without being colored on its surface, and that steel remained colorless when heated under the surface of oil or of mercury. I have frequently heated bright strips of polished steel for hours under the surface of mercury or oil, without discoloration, while they would have been instantly colored at the temperature used if heated in contact with air. I think, further, that there can be little doubt that the oxide so produced is practically transparent, first, because the sequence of colors is what would be expected in films of a transparent substance when the thickness of the films gradually increases; also because of observations on the reflected light, the color of which varies somewhat at different angles; but chiefly because it is found that on increasing the temperature a little above the point necessary to produce a dark blue, the color gradually disappears (though doubtless oxidation proceeds more rapidly), and the surface, though covered with more oxide, becomes almost colorless again. When it is granted that the colors we are considering are the result of oxidation, it would at once appear probable that the nature of the surface to be heated, its freedom from dirt and grease, and the length of time during which it is heated, would all exert a considerable influence on the shade produced. It would also appear probable that the amount of carbon present in the metal, and the condition in which the carbon existed, would have comparatively little influence. Hitherto, my experiments have been chiefly directed to the study of these simple and, as they appear, almost self-evident conclusions."

EFFECT OF STRESS IN STEEL.—In a paper on the behavior of steel under mechanical stress, by C. H. Carns Wilson, read before the Physical Society (British), the following conclusions are reached: The effect of uniform longitudinal strain on a steel bar is threefold. (1) A strain of the molecule; (2) a strain of the elements; (3) a production of flow by the strain of the elements. The elongation due to flow is the strain usually observed, and this may be either recoverable or irrecoverable. The strain of an element is made up of a uniform dilatation and a uniform shear about an axis parallel to that of the bar, and therefore the flow elongation consists of an increase of volume, together with a certain amount of eliding. The author summed up as follows the general conclusions to which his experiments led him: 1. Mechanical strain produces an atomic disturbance in a bar, and this disturbance increases regularly with the stress. 2. For small stresses the disturbance is only partly permanent, but as the yield point is approached it becomes wholly permanent. The magnetic properties of a loaded bar are in general different from those of the same bar unloaded, but there is certain stress, or range of stresses, over which the bar has the same magnetic properties whether it be loaded or not.

FORCED DRAUGHT is coming to be looked upon with disfavour in the British navy, owing to the many breakdowns which have attended its application on shipboard. It is said that a trial trip made under forced draught does more injury to the boilers than four years of ordinary use. More recently, however, the Admiralty has authorized a series of experiments with forced draught on shipboard with locomotive boilers. The plan proposed is this: Instead of forcing the air through the furnaces by means of fans there will be established induced draught. The plan is to operate at the root of the funnel by a fan acting upon the products of combustion, and so fitted that it may be used to accelerate the draught to any degree required. The arrangements in the boiler-room are not interfered with, the driving gear taking the place of the high-speed engine now used for forcing air. One thing that the steamship City of Paris conclusively proved was that forced draught on the closed stokehole system can be efficiently maintained at sea,

SCIENTIFIC PROGRESS.

The Refinements of Modern Measurements and Manipulations.

An address recently delivered before the Engineers' Society of Western Pennsylvania, as reported by the secretary of that society, contains much useful information. We make brief references as follows:

Progress is to-day written upon every page of the world's record, and particularly in the realms of science it is making its unmistakable mark, from thence extending outward to the vast range of correlated studies that go to make up the sum of human knowledge and economies. In astronomy and astronomical engineering, in physics and chemistry, in civil and mining engineering, in meteorology and in metrology and in mechanics, to say nothing of many other branches of science, do we find progress as the watchword and the theme that exalts and moves the human brain to grander and better achievements.

The day has forever passed when we are willing to say or believe that "three harleycorns make one inch." Nor is the advanced mechanic of to-day satisfied with his box-wood rule, graduated to thirty-seconds of an inch, save for the coarsest approximate measurements; but he must have his standard graduated to one one-hundredth inch for his coarse measures, and his micrometer gauges reading to one one-thousandth for ordinary work. Even in our iron and steel works, the old-time wire gauge, that for a long time held its own, has been displaced by the micrometer gauge of infinitely greater accuracy.

Prof. Wm. A. Rogers has shown that many of our modern mechanics can calliper to one thirty-thousandth of an inch. These, however, are coarse, rough measures when compared with others that may be mentioned. In the domain of astronomical measurements great progress has been made of late years by the use of refined instrumental means, as well as the many methods devised for the elimination of instrumental errors. The divisions of the meridian circle have been brought to astonishing accuracy.

The various enlightened and civilized nations have standards of weight and measure that have slowly been evolved from the cubit, the span, the finger-length and the harleycorn, if you please.

Nations have their standards. On what are they based? The French meter is presumed to be one ten-millionth of the earth's quadrant, the English yard evolved from the harleycorn, etc., but the measurements of precision in our day demand an indestructible, absolute and unalterable basis for our standards, so that if they all be destroyed the original is still available. Prof. Michelson has chosen a wave length of sodium light as the basis for a new standard, a something that will remain forever of the same absolute linear value. Now a wave length of sodium light is, roughly speaking, about one forty-two thousandths of an inch long. Now, as this is an appreciable figure, it is evident that any method proposed to measure its absolute value must be of the highest accuracy. The method devised by Prof. Michelson in the refractometer has certainly brought the work to marvelous perfection. He has shown that the error was not greater than one part in two millions, and possibly would be made not greater than one in ten millions. Gentlemen, can you appreciate such a quantity? Yet here is a physicist, with a high ideal of perfection, taking the pulsations that are sent earthward by the sun, and by methods within the reach of human skill, actually recording them upon a standard bar immersed in a freezing mixture, and giving us a universal standard based upon the absolute value of a wave length of light. You may appreciate some of the niceties in the construction of this interferential refractometer when I tell you that in making some of the optical surfaces for use with it, Prof. Michelson demands an accuracy closely bordering on one-millionth of an inch.

In mechanical appliances and in modern machine work great strides are being constantly made toward greater and greater perfection, and, as I said in the outset, the mechanic of to-day is not satisfied with the coarse measures and gauges of our early days; but he must have his steel graduated rules, his micrometer-calipers, his standard reamers, etc. What the English nation owes to their Whitworth, we, in turn, owe to such firms as Brown & Sharpe, Pratt & Whitney, Sellers, Bement, Warner & Swasey, and others, for their valuable contributions to metrology, and their standards of various kinds that have contributed so much to advance the mechanics in this country. The standard measuring device made by Brown & Sharpe have become a power for accurate work. The standard gauges of the Pratt & Whitney Company now find an honored place in all high-class machine shops; and our American machinists are greatly indebted to the labors of Prof. W. A. Rogers and Mr. George M. Bond, who designed and carried into execution that wonderful instrument of precision called the Rogers-Bond comparator, from which has emanated many standard tools, and which has assisted so largely in the introduction of interchangeable parts in American machinery.

It is true that human hands and human brains must have a limit to their capabilities; but where shall we place that limit? Watt

gave us the horse-power as the unit of measurement, Joule gave us the better one of the foot-pound unit; King Henry's arm may have served for the long measure, and the harleycorn for the short measure, but the meter and the micron are infinitely superior; yet we still hope for better standards, and are now reaching out for waves of radiant energy from which to make them, and which shall remain as constant as the universe, "whose builder and maker is God."

DISPERSING FOGS.—The novel proposal for the dispersion of fogs brought forward some time since by a Swiss artillery officer, who has placed upon record his opinion that a phenomenon of this kind recently occurring under his observation was due to a discharge of some pieces of ordnance, has excited considerable comment, and in France the statement has led to several published communications upon the effects of artillery fire upon the atmosphere leading to quite a different conclusion. It appears, for instance, that during the siege of Belfort in the Franco-Prussian war, where an average of 1000 discharges of cannon per hour was registered for many days in succession, firing was frequently suspended on both sides, owing to the dense fogs which settled down upon the field of action, an observation which it is thought would give ground for the supposition that concussions of the air near the surface of the soil by interfering with the circulation of the air, bring about that congealed condition of the atmosphere which is a necessary condition for the production of fogs; and again this conclusion, it is remarked, leads to the idea that not only the aggregation of houses in towns, preventing the passage of light breezes, determines the production of fogs in such localities, but also that the concussion of air due to the shocks of town traffic may operate in the same way. The opinion of good judges in this line of investigation is that not only are further observations of such phenomena desirable, but, now that the nature and causes of town fogs are so carefully studied with a view to their prevention and cure, it is well that every contribution to the elucidation of the subject, however apparently insignificant, should receive attention as possibly containing a clue of value.

EFFECT OF HEAT ON METAL AND STONE.—Long iron bridges are built with overlapping slides at the middle of each span to allow the structure to elongate or shorten itself, as the weather is cold or hot. In the Brooklyn bridge at New York the movement between the extremes of expansion and contraction are several feet. An east and west bridge expands more than one running north and south. The same phenomenon is noticed in stone structures. Bunker-Hill monument leans to the east in the morning and to the west in the afternoon. The same is the case with the Washington monument at the National Capital. The slight hill on which the astronomical observatory at Washington is built is found to follow the movement of the sun with a kind of twisting motion in his apparent course from east to west. This movement sensibly affects some of the more delicate instruments in that institution. A plumb-line suspended from the interior of the dome at Washington was found to swing with a circular motion over a space of four and a quarter inches in diameter, indicating a dip of the dome from a perpendicular of eight and a half inches. Phenomena of this kind were first observed by a monk under the dome at St. Peter's in Rome and by him was at first attributed to a third and undiscovered movement of the earth. Science afterward came to his relief and showed that it was simply the action of the sun upon the metal dome.

AIR AND BURNING COAL.—A little more knowledge of the science of coal combustion would be a good thing for most firemen, and would result in a large saving to their employers. A contemporary says: What there is difficult in understanding that coal requires a certain amount of air to burn it we cannot see; yet some engineers shovel in coal with no consideration of where it goes. Many look upon a chimney as an outlet for smoke simply, whereas its purpose is also to supply air enough to properly burn coal. Any engineer can throw coal on a fire with a sluggish draught, and in time it disappears, and with no great increase in the amount of smoke. That is what the gas manufacturer does, but instead of letting the gas be lost by escaping into the atmosphere, he sells it to this same fireman, perhaps, who supplies it with air and uses it, giving light and heat. The fireman would burn it under his boiler if it were cheap enough, as he does natural gas, and it would evaporate a considerable amount of water. But he would do this only when some one else makes it; for, when he makes it himself, under his own boiler, it is worth nothing to him and is thrown away. Now why is not gas made in an ordinary furnace worth as much as that made and stored up for use by means of a gas retort?

A MUSHROOM MYTH.—It is a popular error that mushrooms grow to their full size during a single night. They are, indeed, rapid in growth and rapid in decay, but the same mushroom may be watched growing and expanding for two or three days, and then gradually decaying. It is not unusual for a cultivated mushroom to become attacked by a parasitic mold, which renders it unfit for food, but such a misfortune seldom occurs to the wild form until it is in process of decay.

Mesmerism—Hypnotism.

A correspondent, "W. A. S.," of Fresno, asks for information in regard to "Hypnotism." "What is hypnotism?" "How is it practiced?" "How much is it in advance of mesmerism as practiced 20 years ago?" "Can the hypnotizer gain the power to hypnotize another?" "Can he hypnotize a stranger through the request of a friend?" We will endeavor to answer these questions serially.

What Is Hypnotism?

Hypnotism is a kind of unnatural sleep into which a person may be placed by a peculiar power or force possessed by another. It is generally acknowledged by scientists who have looked into the matter that this force does not depend upon the imagination and that it does not act in an equal degree upon all. There appears to be but a small percentage of people who are susceptible to this force or influence, and a still smaller number who can exercise it. Some scientists have supposed it might be a fluid—in the same sense in which we sometimes speak of electricity as a fluid. It is sometimes called one and the same thing as animal magnetism—whatever that may be. The question of what it consists is quite as difficult to answer as is the same query in regard to electricity. All we know of either is what is made manifest in their effects.

How Is Hypnotism Produced?

Years ago, when men first began to realize that such a force existed, and to experiment with the same, the hypnotizer usually took a seat directly in front of the person to be hypnotized. The former with each hand grasped the opposite hands of the other, the halls of the thumbs resting against each other, remaining thus from five to ten minutes. The hypnotizer then made slow passes from five or six to a dozen or more with open hands over the patient from head to foot, without, however, touching the person or clothing. During this entire time the operator exercised the entire force of his will-power in silent commands that the subject should submit to his will. In later times, and by the constant exercise of this power, operators have accomplished their work in gradually lessened time, until now the best hypnotizers are often able to throw a person into a hypnotized condition by a look or the will of the operator, or at most by the merest contact of the hand upon the lower part of the forehead. In general, persons of strong constitution and vigorous health are capable of exercising the most ready and powerful influence, and those of opposite character are the most susceptible to such influence. That rule is, however, sometimes reversed.

How Much Is It in Advance of Mesmerism?

Hypnotism and mesmerism are one and the same thing. It was at first called mesmerism from the name of the physician who first made it known to the world about the year 1782. Dr. Mesmer commenced his experiments by the endeavor to cure diseases with the common magnet, and soon found that his magnet appeared to exert a peculiar influence on his patients. He subsequently, however, ascertained that the "influence" proceeded from his person instead of the magnet—that he could produce the same impressions by making passes over his patients with his hands alone, without a magnet. He thus learned that the phenomena were not produced by mineral magnetism but by animal magnetism. Hence the treatment took the name, during his lifetime, of "animal magnetism." After his death his memory was honored by his friends by calling the treatment "Mesmerism." In 1784 the French Government ordered the medical faculty to investigate and report upon Mesmer's theory. Dr. Franklin, who was in Paris at the time, was placed upon the committee of investigation. The commission was not unanimous in its report; but the investigation aroused a deep interest among the medical fraternity and intelligent people generally, and experiments and investigations were kept up, in the progress of which one of the leading physicians made the discovery of what he called magnetic somnambulism. This was in the year 1785. This discovery was closely followed by that of clairvoyance. Many of the alleged phenomena connected with this phase of mesmerism have excited more controversy than has attended any of its other conditions, because, perhaps, of the easier field it presents for the work of the imagination, or for downright imposture. No special interest in these discoveries seems to have been taken in England or the United States until about the year 1825, at which time the subject was taken up by Mr. Braid of Manchester, England. He discovered that a person could be put into a magnetic sleep by being ordered to look steadily at some small object a foot or so from the eye and a little above that organ. To this sleep he gave the name of "hypnotism," from the Greek word "hypnos"—sleep. All these phenomena are now believed to come under the same law—being substantially mesmeric in character. Hypnotism is really the proper scientific term by which all of the class of phenomena of which we are speak-

ing should be known, and it is the term now most generally employed for such purpose.

The Various Stages of Hypnotism.

In this connection it may be interesting to the reader to have the regular sequences of the various stages of hypnotism pointed out, which we will endeavor to do as briefly as the subject will admit. It should be premised, however, that there are some hypnotizers who do not believe in these regular stages. We have already described how hypnotism is produced. The conditions or stages of the mesmeric influence are generally recorded as six in number, and in the following order:

1st. A slight impale, known as wakeful magnetization, in which the person feels a prickling influence much like that felt in a limb "asleep," as it is called; the patient all the while retaining his normal consciousness.

2d. A sense of drowsiness comes over the patient; the pulse falling; breathing quicker, but still conscious.

3d. A state of senseless sleep, wherein he is insensible to the loudest noises, with the nerves of sensation evidently benumbed.

4th. The fourth stage is that of magnetic somnambulism, in which the patient enters upon an apparently new sphere of existence. He has consciousness and sensation, but only toward the operator, whom he hears and obeys. His own senses of touch, taste and smell are dormant. If the operator gives him a junk of fat to eat and tells him it is cake, he eats it, and it tastes to him like cake; he takes water and thinks it whisky, etc. If he is told a stick is a snake, he regards and treats it as such.

5th. The fifth stage is that of clairvoyance. The patient seems to have means of perception unknown in the normal condition of any human being. It is claimed that he is able to see through opaque substances—through walls of wood or stone, even into his own body or that of another, as though the internal parts of the body were set up in a glass case, etc. So remarkable are the asserted phenomena connected with this condition, and so impossible to man in his normal state, that their asserted existence in the somnambulist condition seem impossible to the ordinary mind. It is in this state that the mental faculties seem to be unusually acute, quite supernatural—so much so that a person when so directed can speak with clearness and with oratorical effect before an audience, although in the normal condition he cannot speak in public at all.

6th. There is sometimes indeed a sixth condition which is regarded as an exalted state of the fifth, in which the subject is said to see what is going on at a distance of a hundred miles or more. He also reads the past and foretells the future, etc.

7th. To the above may be added that of mind-reading, to which further allusion will be made at the close of this article. Moreover, if there is any reality in any of the phenomena connected with "spiritualism," as it is called, they may also, with good reason, be relegated to this wonderful principle of hypnotism, of which, like electricity, we see so much and know so little.

It should be added that no precise line can be drawn between these various stages of hypnotism, neither are they all apparent on every occasion; but when they do appear they take about the sequence as above described.

Can the Hypnotizer Give the Power to Hypnotize to Another?

He cannot directly and at once, but the power is one of development. By continual practice, with strong efforts to centralize the will-force on his subject, he can gradually develop the power in most persons to a greater or less extent. But few, however, seem to be so constituted that they can attain any remarkable success in this direction.

Can Any One Hypnotize a Stranger at the Request of a Friend?

If the friend is at a distance and out of sight of the operator, no. The influence must be exerted directly, either by personal contact or the subject must come under the direct action of both the mind and sight of the operator.

Mind-Reading

There is no doubt one of the latest phases of hypnotism. That mind impressions are conveyed from one mind to another, or that one person can read and articulate the impressions made upon the brain of another, is now placed quite beyond successful controversy. But hitherto it has been considered that personal presence of the two was necessary. But as we write, intelligence comes over the wires from Washington, and from very good authority, of certain tests recently made in that city and Philadelphia, which tend to show that mind impressions can be conveyed from one person to another through the medium of the telegraphic wire, without being voiced. At a public exhibition in Washington, a mind-reader, Mr. J. Randall Brown, blindfolded, was at one end of an insulated copper wire, and at the other end was a gentleman whom the audience knew not to be a confederate. Each gentleman held the wire to his forehead, and the one who had the use of his eyes opened a watch and read to himself the figures composing its number. Brown at one end of the wire wrote the figures on a blackboard as they were revealed to the eye and mind of the gentleman at the other end. The fact that the reader unconsciously made one mistake in reading one of the figures serves to add to the claim that intelli-

gence passed from one to the other without words or signals and through a wire. At another test in Philadelphia, made a short time since, ex Governor Pollock of Pennsylvania, who died a few days ago, held the wire in Wilmington, Delaware, while Mr. Brown, who was at the other end in Philadelphia, 25 miles distant, successfully wrote numbers upon which Pollock fixed his mind.

In conclusion we would remark that the main phenomena asserted in hypnotic practice may be set down as indisputable facts. It is, indeed, difficult to conceive the reality of such things, and if we admit them, it is equally difficult to discover any valid reason why developments should stop where they are, or why they should not go on progressing with the ages until humanity has developed powers beyond anything of which, even in its present state of advancement, the human mind can conceive.

GOOD HEALTH.

FOOD AND HEALTH.—The tendency of the age is toward greater refinement in food as in other departments of living, even among the middle classes. In a lecture lately delivered at the Smithsonian Institute on "Food and Health," Prof. Atwater quoted from Sir Henry Thompson as follows: "I have come to the conclusion that more than half the disease which embitters the middle and latter part of life is due to avoidable errors in diet, and that more mischief in the form of actual disease, of impaired vigor and of shortened life, accrues to civilized man in England and throughout Central Europe from erroneous habits of eating than from the habitual use of alcoholic drinks, considerable as I know that evil to be." Prof. Atwater holds that this evil of overeating, he it great or small, is confined practically to the classes to whom generous fortune, unchecked by reasonable restraint, allows it. "There are," he says, "countless sufferers from dietary habits into which self-indulgence has not tempted, but relentless fate has forced upon them. The overfed only pay for pleasure the penalty of pain." Another great cause of stomachic troubles in this country has always been the haste with which food is literally "bolted" by men of nearly all classes. They could not or would not take the time necessary to the proper eating of a meal, preferring to rob themselves of health to rob their business of even a few minutes' personal attention. But we are growing away, slowly, from this bad habit, and the time is approaching when Americans will have good digestions to wait upon appetite.

DON'T SIT ON YOUR SPINES!—"We ought to establish in the United States a school of deportment for public men," says Kate Field. "And the first motto I should hang up over the door would be: 'Don't sit on your spine!' I couldn't help thinking of that as I sat in the gallery of the House of Representatives the day the Chief Justice delivered his oration. In marched the President and Mr. Blaine, followed by the other secretaries, and sat down in the first row of the amphitheater. Sat? Yes; sitting is what it is called. Within five minutes every mother's son of them, with perhaps one exception, had slid down so that his body was supported by his shoulder blades and the small of his back. The justices of the Supreme Court followed, and down they went in the same way. So did the rest of the dignitaries, as busy after being filed in. In contrast with them there sat the foreign ministers and the delegates to the two International Conferences, as upright as ramrods. What made the contrast most disagreeable was the fact that our own great men were by far the best-looking persons on the floor, as a rule. It seemed a pity that they should spoil their fine effect by such an attitude. But it is the common fault of Americans in public places. Congress habitually sits on its four hundred and odd spines when it isn't making speeches or writing letters. Our magistrates do it on the bench. Our legislators do it. Everybody does it."

BLINDNESS FROM INFANTILE NEGLECT.—It is distressing, says London *Figaro*, that out of the 7000 persons blind from their birth in this country who owe their loss of sight to inflammation of the eyes, at least two-thirds of them might now have been in the enjoyment of their sight but for the ignorance or neglect of their earliest guardians. It seems that the remedies for the infantile inflammation which causes blindness are both many and simple. Thus it cannot be too widely made known that the eyes of a newly-born child, if inflamed, should be washed with pure warm water, and that then a single drop of a two-per-cent solution of nitrate of silver should be instilled into each with a drop-tube. In Germany midwives are enjoined to adopt the above remedial treatment, under oath, and since that has been done the decrease in the number of blind children has been most appreciable.

NUTS AS FOOD.—They are indigestible things at best; but if we must eat them, a little salt taken after, either in water or dry on the tongue, will prevent any ill-effects. Nothing we eat needs more thorough mastication than nuts before being fit for the human stomach. If swallowed in too coarse a condition, they are apt to make a short stop in some of the narrower passages of the digestive organs with fatal result.

USEFUL INFORMATION.

Splitting a Grindstone.

A workman was trying to split a grindstone. When a stone is new and four feet in diameter, 10 inches is none too thick, but when that stone wears down to 24 inches it should be split. It is too clumsy, but will make two nice stones if carefully split.

The man in question had drilled a row of holes around the stone, about three inches apart. Ordinary shims and wedges like those used by stone-cutters were put in the holes and driven up by a hammer in the usual way. One wedge was driven a little too hard, and out came one side of the stone, spoiling half of it.

Had that workman had the "know how" he would have turned a deep groove in the stone before it was removed from its former hanging. The groove should be three inches deep, and three-fourths of an inch wide outside, tapering to as narrow as possible to be made at the bottom. This groove done, the shaft and collars to be removed and the groove driven full of dry pine wedges. Put them in carefully, all equally tight. Throw the stone into the water, let it lie over night and it will be split nicely.

The Speed of Grindstones.

The speed for running grindstones is an important practical question. The general impression is that the surface velocity of a large stone can be greater than that of a small one—which differs from the rim of the fly-wheel, because of its being a disk. At the Whitney & Barnes Co., Syracuse, N. Y., where a large number of stones are employed, they run three six-foot stones for the edgers, while they use a mechanical holder for the work at about 2800 feet per minute, and the same stones for hand-grinding about 4000 feet per minute. For Ohio stones a surface velocity of from 2000 to 2500 feet is considered the limit of safety. For Huron stones from 2800 to 3500 is recorded as the limit. The best and most economical speed of grindstones no doubt depends largely on the quality of the stone. The limit of speed for any special variety, diameter and thickness of stones should be thoroughly tested by putting a heavy guard over one, and run on up with graduated speed until it bursts.

HOW TO SHARPEN A RAZOR.—A correspondent of the *Scientific American* writes as follows: Use two hones, an Arkansas oil stone and a fine razor hone. The razor is at first applied to the Arkansas stone, using fair pressure, and finishing with lighter and lighter pressure strokes. Remove razor from the coarse hone to the fine razor hone, upon which oil is also employed. With a few light strokes on the fine hone, an enduring, hair-splitting edge is formed. If the razor be kept on the finishing hone too long, the fine edge will be lost. If this be the case, the process must be repeated, that is, the razor is again applied to the coarser hone and again finished upon the fine hone, care being taken to cease honing after the razor has acquired the hair-splitting edge. Very little practice is required to ascertain when that point is reached, a few hairs of medium fineness supplying the required test. No doubt other instruments requiring very keen cutting edges could also be sharpened in manner indicated. The coarse hone employed should be of sufficiently fine texture to put a smooth edge on a pocket-knife, but not fine enough to give a smooth cutting edge to a razor.

TESTS FOR UNDERWEAR.—A new method of testing woolen garments is by putting caustic soda into a cup of water, and dipping the article whose genuineness is doubted into the mixture, of course being careful not to touch the liquid. The caustic soda will quickly burn animal fibers, but has no effect upon those of a vegetable origin. If the article is all wool it will be dissolved in the liquid, leaving nothing but a track of coloring matter. If the material is cotton it comes out unneathed. When the material is wool supported by a framework of cotton, the latter being indistinguishable to the eye by ordinary test, the caustic soda quickly divorces the two, dissolves the wool and leaves the cotton as clean as if it had been woven by itself. It has been suggested that people might buy a class of underwear made of wool and cotton mixed, that when the sultry days of spring arrive, a bath of caustic soda might be prepared, the garment dipped therein to emerge in the form of cotton gossamer for the summer season.

THE MANUFACTURE OF HAIR CLOTH.—There is no such thing as hair cloth—pure and simple—as the warp is always of some other material, cotton or linen as the case may require, dyed black or such color as is wanted, and sized in the usual way. The looms used are ordinary hand looms. The hair is kept in water previous to its being woven in order to preserve its elasticity. The hairs are caught by a hook on the shuttles and woven one at a time. After leaving the looms, the goods are not calendared in order to give them that characteristic luster.

WHEEL AND AXLE.—The reason why car wheels are made to revolve with the axle and not on it is that the leverage of the wheels over the bearings is less when the wheels are secured to the axles; moreover, this construction is better calculated to withstand lateral thrusts.

Passing Events.

The news of the strike in the 1700 foot level of the Idaho mine at Grass Valley, though welcome, will scarcely surprise those familiar with this famous mine, which this week declared its 24th dividend. This is the most promising gold mine in the State.

Trouble has been expected in the Old World and in the East on May 1st, Labor Day, over the adoption of the eight-hour rule. We go to press too early to state whether these fears have been realized or not. Locally, however, there has been no trouble. The carpenters have carried their point without active opposition and other trades are expected to follow.

The advance in silver makes it within the possibilities that many closed-down mines on this coast will resume operations shortly. Even with a slight recession in price many of them could now go on with profit. The discount is still large, but nothing at all to what it has been.

There is little or no change in the situation as regards the local molders' strike. It is thought that the foundry strike in Chicago, however, may have some effect on affairs here.

MINING COMPANY'S BOOKS.—W. W. Hickies, president of the Ithaca Gold and Silver Mining Company, who several weeks ago was convicted by a jury in Judge Rix's court of misdemeanor, in refusing to permit some of the stockholders to examine the company's books, has been fined \$500, with the usual alternative of imprisonment.

Duping Inventors.

A case is on trial in this city where a man calling himself a "patent agent" is accused of using the mails for improper purposes and swindling inventors.

Two or three men went into a partnership under a high-sounding name, with the ostensible business of selling patents on commission. Their method of operation was to take each week the names of patentees from the Official Gazette of the U. S. Patent Office, send them a circular and offer to sell the patent-right for the Pacific Coast for them.

Shortly after they would write and say (or intimate) that a purchaser has been found, but that it would be necessary to have \$18 or \$20 to search the title, etc. If the money was forwarded, as it often was, the inventor could never get any further word from these so-called "patent agents."

This concern was started as far back as 1886, and although there have been many complaints, the men have usually been able to get clear and continue their nefarious work.

The testimony in this case is to the effect that in the four years in which they were in business they had only sold three patents and could not even recall what they were. One of the employees testified that not a single customer was ever seen to enter the office to inquire about a patent or examine a model. The whole business consisted in writing letters to those who desired to sell.

No hooks or records were kept of any transactions. Not a single letter could be shown from the authorities at Washington in relation to patents. It could not be shown that a single search had ever been made of the titles of any patent whatever.

In the circulars it was stated that each patent for sale would be advertised in 100 newspapers, but this man could not give the name of a single paper in which any advertisement of the kind had appeared. Nor could he remember the name of more than one person, a resident of this city, who had ever called at his office on business connected with the purchase of a patent.

It was also shown that one of the employees had been asked to pose as a capitalist desirous of buying patents, he being assured that the victims were generally poor and not liable to go to the expense of prosecution.

It is outrageous that such an institution as this could have continued business as long as it has without its projectors being taken by the strong arm of the law. Such men are the worst kind of swindlers, taking as they do the money from poor but confiding inventors. People who intrust their patent business to others should inquire carefully as to the standing of the firm before doing so.

The Advance in Silver.

The steady advance in the price of silver is of the greatest importance to the silver miners, and they greatly rejoice. The white metal has been depressed in commercial value for a long time, resulting in the closing down of hundreds of mines on this coast and also great loss to many working mines. The discount has been so heavy that low-grade mines had no chance for any profit at all. The big silver mines, producing largely, have severely felt the effects also. Now, however, that it has gone above the dollar mark once more, many mines will doubtless resume operations.

To the State of Nevada, in particular, this increase in the value of silver is of the greatest possible interest. Mining matters there have been dull for a long time. Colonel S. Wenban, a prominent Nevada silver miner, says: "This sudden rise in silver is giving a great impetus to the mining business, especially in Nevada. The boom has struck us in earnest, and there will be a general increase in the product of every silver mine in Nevada and California. To-day silver reached 105. If it goes up to 110 the result will be that the mining interests of this coast will be doubled at least. It will make a boom that will mark a new era on the coast and create a better feeling in all circles of business. There are lots of mines in both Nevada and California that are lying idle simply because the owners cannot obtain the necessary capital to work them. But the outlook now is excellent. Things are brightening up, and I expect to see the highest mining time ever seen on the Pacific Coast."

Eight Hours of Labor.

Thursday, May 1st, was the day set under a general plan by the labor unions of America and Europe to inaugurate the eight-hour system of labor. In Italy, Germany and Austria, troops have been held in readiness to suppress disturbances. In the cities of London, Paris, Vienna and Glasgow, labor demonstrations have been kept in check by the authorities. In this country, although there are prevailing strikes of more or less magnitude in Chicago, Boston, Philadelphia and San Francisco, there has been no trouble and none of a violent character is anticipated.

In the United States the building trades are to inaugurate the system, when others will follow. With us in San Francisco and Oakland the eight-hour demands of the carpenters, plumbers, lathers and gasfitters have been conceded by the contractors without any contest.

The iron trades on this coast, including molders, patternmakers, machinists and boiler-makers, are prepared to exact an eight-hour work day when their Eastern brethren fix a date. The National League Conventions of the various branches of the iron trades will be held within the next six weeks. Each will fix the date when its members shall exact the enforcement of the eight-hour system.

The men employed in the planing-mills on doors and blinds will make their demand for an eight-hour day on July 1st. The painters and decorators have set their day for June 1st, and the stair-builders will soon follow.

The United Brotherhood of Carpenters and Joiners was selected to make the first move in obtaining the short day in the United States. The membership of this organization is 65,000. Many other trades have joined this body to attain the same object.

It is natural to suppose that unless these demands are conceded, there will follow a greater strike than has been known before. Already contractors here, in order to protect themselves against the emergency of a general strike, insist upon a "strike clause" in their contracts, providing for an extension of time.

A manifesto issued by the American Federation of Labor orders all labor unions outside the building trades to refrain from sympathetic strikes for the present, letting the first test fall upon the holding trades. In the large cities of this coast the men carried their point without active protest, and there has been no trouble whatever.

MECHANICS' FAIR POSTPONED.—The Trustees of the Mechanics' Institute have issued the following statement: The Board of Trustees of the Mechanics' Institute beg to announce to their many patrons and exhibitors that, in compliance with the request of the Society of Pioneers, the Native Sons of the Golden West and many of our most prominent citizens, we have granted them the use of the Exposition building on the 8th, 9th and 10th of September for the purpose of celebrating the fortieth anniversary of the admission of California into the Union. This necessitates a postponement of the opening of our annual fair, and the Board of Trustees have decided to open the Twenty-fifth Industrial Exposition on Thursday, September 13th, and close Saturday, October 25th. The machinery department will be open for the reception of goods on and after Sept. 1st and the main building on and after Sept. 12th.

THE STEWART MINING BILL.—Mr. A. C. Light of Taylorville, Plumas Co., writes us as follows: "I am entirely opposed to having our mining law changed from January 1st to the 1st of October or to any other day. No matter what the date may be, the miner has just as many clear days to work out his assessment during twelve months. On the whole, Mr. Stewart's proposed amendment will do more harm than good, not only to the miner, but to all other classes. To use a common phrase, I think Mr. Stewart 'don't know beans.'"

UP at Spokane Falls they are talking of making a magnificent mineral palace, similar to that at Pueblo, Col. The structure will be used as an exhibition building for the various mineral and other products of the great Northwest and will be built entirely of galena and other ores taken from mining camps tributary to Spokane Falls.

Grand Canyon of the Colorado.

NUMBER IV.

Wherever we reach the Grand Canyon on the Kaibah division, it hurls upon the vision in a moment. In the Kaibah the forest reaches to the sharp edge of the cliff, and the pine trees shed their cones into the fathomless depths below. The scenery of the amphitheaters far surpasses in grandeur and nobility anything else of the kind in any other region, but it is mere by-play in comparison with the panorama displayed in the heart of the canyon. The supreme views are to be obtained at the extremities of the long promontories which jut out between these recesses far into the gulf.

In these amphitheaters, one cannot fail to be much impressed with the intricate and yet systematic manner in which the ground plan of the walls is laid out. Great alcoves and cnsps are formed, and wherever the wall makes a turn, it is by a well-rounded inward curve or by a sharp cusp-like projection. The architectural details are always striking, and by their profusion and richness suggest an oriental character.

In Mr. Dutton's description of the scenery in the Kaibah, he says: Crossing the park, and ascending the heights upon the east, we once more descend into a rather deep ravine of the usual type. Upon its bank the trail passes by a small trickling fountain, known as Thompson's spring. A basin has been dug and made water-tight to save the scanty supply of water. The water is excellent and this is an important camping-place.

From this point we may visit many interesting localities. Following downward the main ravine about five miles, we find it at length betraying evidence that it is near the brink of some amphitheater. Climbing the steep bank to the main platform, 300 feet above, we move toward the southwest, and in half an hour more are upon the verge of one of the finest and perhaps the most picturesque of the gorges of the whole Kaibah forest. It is a tributary of the Bright Angel amphitheater, and has been called by us "The Transsept" (see engraving). Though only of the second or third order of magnitude among the lateral excavations of the Grand Canyon, it is far grander than the Yosemite. At the very head of this gorge the walls plunge downward at once more than 3000 feet.

As the gorge deepens toward its junction with the main amphitheater, the aspect of the lateral walls, as they recede from us, becomes most imposing. The details of their sculpture are very beautiful and thoroughly systematic, and every characteristic is sustained throughout their whole extent. The entire length of the chamber is seen in perspective. Beyond its opening we see the grandeur of the central canyon with huts beyond huts, and the vast southern wall of the main chasm in the background 15 miles away. To many spectators the dominant thought here might be that this stupendous work has been accomplished by some intelligence akin to the human rather than by the blind forces of Nature. Everything is apparently planned and out with as much definiteness as a rock temple of Petra or Ellora.

LEAD ORES.—Assistant Secretary of the Treasury Tichenor has informed the United States Consul at Paso del Norte, Mexico, that in case of ores composed of silver, gold and lead, where the silver and gold together are of chief value, the ore would not be dutiable; but where the lead is more valuable than either of the others separately, the ore would be dutiable under the provision of the law for lead ores. The term "chief value" of an article or substance composed of three materials means greater than either of the others and not greater than their aggregate.

THE Regan Vapor Engine Co. of this city have recently elected Lney N. Smith president in place of Francis Cotting. In this engine the carburetor contains a small quantity of gasoline. At each revolution of the fly-wheel, a current of cool air is driven through the carburetor and into the cylinder. In passing through the carburetor it vaporizes a quantity of gasoline, and the vapor is ignited by an electric spark, developing the power. The engine is useful for many things, and especially so for small steam launches.

THEY are talking of holding an iron pier out into the ocean from Coronado Beach,

Quicksilver Mines.

Mode of Occurrence of the Ore.

The New Almaden, Enriquita and Guadalupe mines lie nearly south of San Jose, Santa Clara county, in this State. The district has been much more productive of quicksilver than any other in North America, and since 1850 has yielded about four-fifths as much metal as the

deposits themselves are of various types. The commonest is the reticulated mass, consisting of irregular bodies of broken rock into which solutions of cinnabar and gangue minerals have filtered, cementing the fragments together with ore. Where the disturbance has been less extensive and irregular, clean-out fissures may sometimes be seen filled with ore, and these can only be classed as veins though they are

been surveyed with the utmost care by the officers of the Quicksilver Mining Co., and data exist for the construction of any desired sections. Two sections, here reproduced, show the structures.

Fig. 1 shows a section taken along the course of the south group of horsting. The line on which the section is made was selected with a view of illustrating the continuity of ore from

below, because the tenacity implied in the movement of the entire hanging country without fracture would be improbably great even were the rock much firmer than the materials of which the Coast Ranges are chiefly composed. Such a fissure intersecting the hanging country really exists, and a trace of it may be perceived on this section from the 1500-foot level downward, where the slopes show that the ore

Fig. 1.—UNDERGROUND SECTION OF NEW ALMADEN MINE, SANTA CLARA COUNTY CAL.

Almaden of Spain. The general geology of the district presents one special feature of geologic interest in the occurrence of rhyolite, a lava not yet recognized at any other point on the Coast Range. Otherwise the geology presents no novelty. The great opportunity which the district offers is for the study of structure dis-

not persistent. Impregnations also exist where the ore-bearing solutions have encountered permeable sandstones.

From any one accessible slope of the New Almaden mine it is evident that the country has been intersected by fissures, that energetic motion has taken place along these fissures,

the surface at the top of Mine Hill to the lowest workings. The group of ore bodies thus intersected is for the most part distinct from that to the east of the Randol shaft. It is manifest from this section that a fissure extends from the lower workings to the top of Mine Hill, a vertical distance of about 2000 feet, and

occurs on parallel lines. The line of the northerly slopes in this region, if continued upward, would reach the surface near the point at which the Randol shaft appears projected.

Another view of the two fissures is shown in Fig. 2, where they are intersected by an east and west vertical plane. To the right appears the south ore-channel, including the O'Brien, Don Frederico and other bodies; to the left is the north fissure.

The existence and position of the two fissures are not so evident and clear as would appear from the foregoing notes. The ore bodies lie upon complex curved surfaces. The result is that no vertical plane intersects both fissures at right angles throughout, and no single section affords indubitable evidence of two fissures. Views similar to what is shown in the section might be given along a single doubly-curved surface. Could one but represent the fissures by contours, the entire structure would be shown in three dimensions and would not be ambiguous. The fissures are marked by clay seams or alae.

Between the two principal fissures a wedge of country rock exists. It is not uncommon for great masses of this description to be inclosed on both sides by ore-bearing fissures. Such was the case in the Comstock and also in the Ruby Hill mines at Eureka, Nev. Ground thus inclosed is seldom solid, and subsidiary fissures leading into it are often ore-bearing. In the New Almaden mine the ore is not confined to well-defined fissures. It is true that ore can be followed from the top of Mine Hill downward to a depth of 1600 feet practically without a break; but the sections show that at many points the fissures are systems of associated openings rather than simple ruptures. The wedge of ground between the principal fissures is not a solid mass, and subordinate fissures and ore-channels exist in it.

The Fox Platform and Coupling Co. has applied to the Superior Court for permission to dissolve the corporation in pursuance of a resolution adopted by the stockholders.

The southern mining districts along the Carson & Colorado R. R. are all exhibiting considerable activity. Interest is principally centered on Cerro Gordo and Sylvania.

The statue of James W. Marshall, the discoverer of gold in California, is to be unveiled on Saturday, May 3d, at Coloma.

NICKEL ORE is to be placed on the free list.

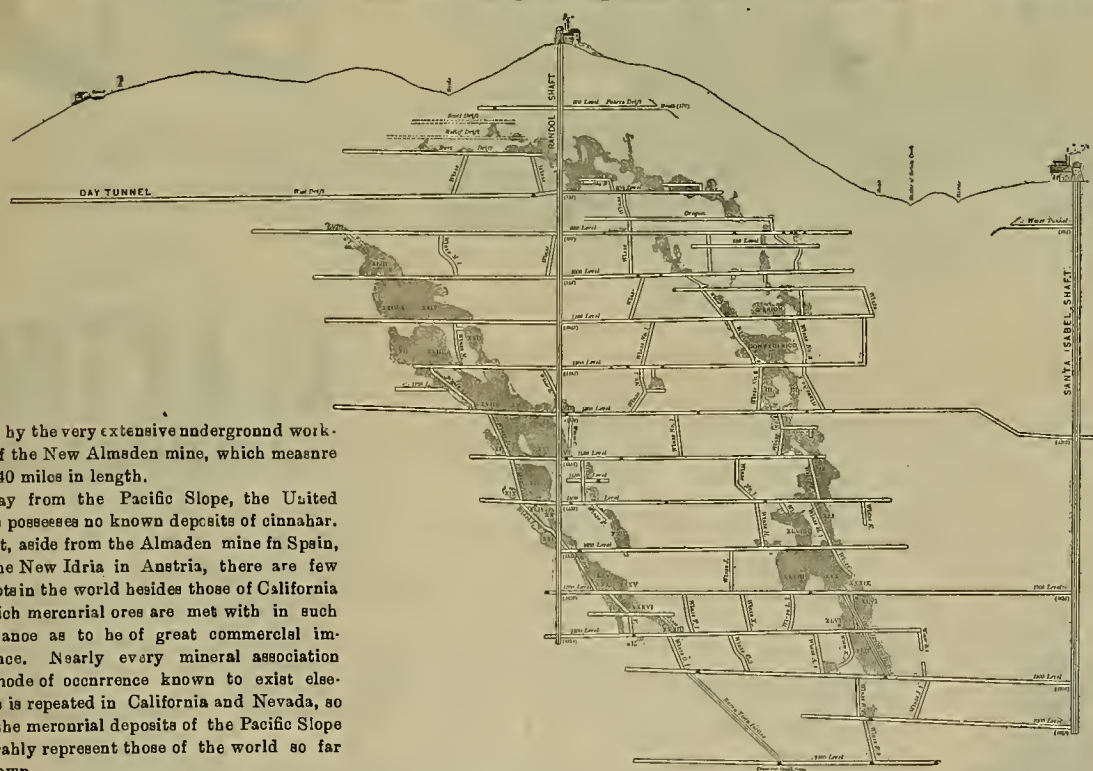

Fig. 2.—EAST AND WEST VERTICAL SECTION, NEW ALMADEN MINE.

closed by the very extensive underground workings of the New Almaden mine, which measure over 40 miles in length.

Away from the Pacific Slope, the United States possesses no known deposits of cinnabar. In fact, aside from the Almaden mine in Spain, and the New Idria in Austria, there are few districts in the world besides those of California in which mercurial ores are met with in such abundance as to be of great commercial importance. Nearly every mineral association and mode of occurrence known to exist elsewhere is repeated in California and Nevada, so that the mercurial deposits of the Pacific Slope admirably represent those of the world so far as known.

The New Almaden is the most important quicksilver mine in the United States and has always been the greatest producer. In Monograph XII of the U. S. Geological Survey, "Geology of the Quicksilver Deposits of the Pacific Slope," by Geo. F. Becker, considerable space is devoted to consideration of the structure of this mine. Prof. Becker's conclusions with reference to the ore bodies in the mine are of great interest. Some of his statements in this connection are here given.

While the evidence of the existence of a fissure system is, if possible, more abundant in the New Almaden mine than in most other quicksilver deposits of the Pacific Slope, the

that the adjoining rock masses have been shattered more or less irregularly, and that solutions entering the ground have deposited ore in such spaces as were vacant. It is also apparent from the relations of the ore to the clay that the solutions have entered from below, and it is almost a necessary inference that the fissures served as channels of ingress for the solutions. These conclusions may be drawn in each of as many chambers as the observer can reach, and he will find nothing to conflict with them in any portion of the mine.

The surface and workings of the mine have

that the ore has been deposited almost continuously along its entire course. This fissure is remarkably sinuous in vertical section, and a long tongue of ground north of Mine Hill has manifestly moved northward sufficiently to leave space for the deposition of the ore.

If one considers the character of the disturbance to which the fissure must owe its origin, it appears almost certain that this tongue of country rock overlying the fissure cannot have remained intact. One would expect to find one or more fissures intersecting it in a direction more nearly vertical than the south ore-chan-

Dewey & Co., American and Foreign Patent Agents.

PATENTS obtained promptly; Caveat filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and thoroughly established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of most inventions discovered here than any other agents.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars of information to inventors, free.

Home Counsel.

Our long experience in obtaining patents for inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes mislaid, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees intrusted to our agency.

Engravings

We have superior artists in our employ, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and Pacific Rural Press, 220 Market Street, Elevator, 12 Front St., S. F.

WORTHINGTON STEAM PUMPS!

Will Contract to Pump any Elevation at One Lift.

We are pumping through one continuous line of pipe 114 miles long against a pressure equal to 3500 feet elevation.

WE HAVE MORE PUMPING CAPACITY SUPPLYING WATER WORKS

Than all other Manufacturers in the United States Combined.

WE BUILD PUMPS FOR EVERY PURPOSE

FOR WHICH PUMPS ARE USED,

And against pressures up to 8000 pounds per square inch.

Send for Illustrated Catalogue.

A. L. FISH,

Pacific Coast Sales Agent,

NOS. 59 AND 61 FIRST STREET, - - - DONAHUE BUILDING, SAN FRANCISCO.

— ALSO AGENT FOR THE —

NATIONAL WATER PURIFYING COMPANY,

Having the largest Artificial Plants in the United States in operation in Philadelphia and Chattanooga, having changed the next best system, in several instances, to the National. Any capacity guaranteed.

— THE —

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal. W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS, And will furnish descriptive Catalogues and quote prices upon application.

ADAMANTINE SHOES & DIES FOR STAMP MILLS.

These SHOES and DIES are in extensive use in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.

—MANUFACTURED BY—

CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent,

220 Fremont Street, San Francisco, Cal

Special attention given to the purchase of Mine and Mill Supplies

VAN DUZEN'S STEAMJET PUMP

For MILLS, FACTORIES, SHOPS, ETC. For Elevating and Conveying Liquids. For Emptying Pits, Sinks, Cesspools, etc., and as a Fire Pump. 10 Sizes. \$7 to \$75. Every Pump warranted. Write for Descriptive Pump Circular, V. VAN DUZEN & TIFT, CINCINNATI, O.

School of Practical, Civil, Mechanical and MINING ENGINEERING, Surveying, Architecture, Drawing and Assaying 723 MARKET STREET.

The History Building, SAN FRANCISCO, CAL. A. VAN DER NAILLEN, President. Assaying of Ores, \$25; Bullion and Chlorination Assay, \$25; Blowpipe Assay, \$10. Full course of assaying, \$50. Send for circular.

Testing and Working Silver Ores

A VALUABLE BOOK.

An illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working samples, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles Smelting, Mexican process, Chilean process, Kroschke's process, etc. Under "Pulverizing Machines" are described the anatomy and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing harrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg harrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnaces tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings, and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

Price, post free, \$2.00. Sold by Dewey & Co., Publishers, 220 Market St.

THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works, Sole Manufacturers, 327 First Street, San Francisco, Cal.

CLAYTON AIR COMPRESSORS

For Working Rock Drills, Coal Cutters, Hoisting Engines and Water Pumps in Mines and Tunnels, Sinking Caissons, Etc., Etc.

SEND FOR CATALOGUE No. 6.

Clayton Air Compressor Works, 43 DEY ST., NEW YORK.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placer, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid for sale by Dewey & Co., Publishers, 220 Market St., San Francisco.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER,

258 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

Postmasters

are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other mishap, do us the favor to write again.

Coast Industrial Notes.

Two oil companies of Ventura county are paying dividends.

The *Merced Express* says the crying want of that place is a good flouring-mill.

The wool clip of Otay Valley, San Diego county, to date weighed 133,500 pounds.

LOCAL capitalists at Tacoma have secured a piece of land for building a large dry-dock.

A SHINGLE MILL at Hood River, Oregon, has bolts enough on hand to cut 7,000,000 shingles.

NATIONAL CITY, San Diego county, has an olive oil mill that will soon be handling 32 tons a day.

The miners about Colton are trying to induce some capitalists to erect reduction works at that place.

The President has signed the bill by which \$200,000 is appropriated for the erection of a public building at San Jose.

The rise of silver quotations has caused the small mining claims to operate. Should silver rise to 115, the Comstock and surrounding deposits will probably boom.

SACRAMENTO salmon cannerymen have about decided to close down, owing to a strike among the fishermen at Martinez who have demanded two and one-half cents a pound for fish.

A LARGE SCHOONER left Los Comas, Oregon, last week with 300,000 feet of lumber for San Luis Obispo. This was the first deep-water vessel that loaded at that place.

A COMPANY has been organized to make compressed blocks of San Luis Obispo bituminous rock for street purposes, and works are being erected. Each block is formed under a pressure of 115 tons.

The Ventura county supervisors have passed an ordinance that compels owners of ditches and flumes to put wire screens at their mouths to prevent fish from being drawn away from their native streams.

THREE salmon canneries on the Columbia river are running, notwithstanding the strike. Non-union men and ranchers furnish the fish, which are in plenty. The fish-wheels at the Cascades are doing well.

A VALUABLE iron mine was recently discovered in the Capelle valley in Napa county. Preparations are being made by parties interested to work the mine. The ore will be hauled to Napa, then shipped to San Francisco.

The bituminous rock teamsters have formed a union at Santa Cruz, owing to two companies reducing the price per ton for hauling from \$2 to \$1.75. The teamsters say they will quit work if the original price promised them is not given.

NEWS was received at North Yakima, Wash., on Saturday, that enough bonds were sold in New York to insure the completion of the big canal and irrigating works. The bonds were guaranteed by the Northern Pacific Railroad Company.

TWO and three-fourths miles of jetty at the mouth of the Columbia river have been completed, leaving one mile and a quarter to finish the work. Since July, 1889, 7580 feet of extension have been made, and the amount of filling has been 750 tons of rock.

J. V. B. McCURDY is the patron of Queen City, Paradise Valley, Nevada. He owns the only house in the place. It stands in the center of a 5000-acre tract, which is inclosed with a seventeen-wire fence, rabbit-proof. Inside this fence roam some 3000 Angora goats headed by thirty prize colliers.

CAPTAIN JOSEPH BERRY, the veteran millwright, has just completed building a four-stamp mill for Fisher in Sixmile Canyon, Nev., west of the site of the old mill. The new mill is operated by an overshot wheel 33 feet in diameter, with a belt pulley 22 feet in diameter. The mill is now crushing ore from Cedar Hill croppings. The mill has a crushing capacity of eight tons in 24 hours.

A LARGE quantity of Amador county sandstone is being shipped to Stockton to be used in a new church there. The work of filling a large contract for the mansion of young Crocker will be commenced shortly. The mansion is intended to be one of the finest in San Francisco. Lone sandstone is now known all over the coast and is classed as the very finest of building stone. It is reported that a force of fifty or more men will be employed at the quarry during the coming summer.

A LARGE deposit of gypsum is reported in San Bernardino county, in the foothills east of Grayhawk mountain, and about sixteen miles northeast of Whitewater. The principal uses of gypsum are for plaster of Paris (by calcining) and fertilizer. The find is ten miles from present railroad communication and the survey for the proposed Union Pacific extension runs within a quarter of a mile of it. The finders, W. D. Barsley and M. L. Wilson, hope to enlist the co-operation of capitalists in developing the ledge, which is said to be very wide.

THE Southern Pacific Co. spends a great deal of money for coal. The average cost of coal to the company for the Pacific system has been about \$6 or \$7, and 75 cents a ton duty has been paid for years on the largest part of what has been used. The company has two colliers, the San Pedro and the San Mateo, engaged in bringing coal from Puget sound to San Pedro and San Francisco, and will soon have in operation the largest collier on the coast. Mr.

Huntington recently purchased the San Benito, an iron steamer in the European trade, which is now being changed for coal carrying at Newport News on the Atlantic Coast. Its capacity is 4500 tons dead weight besides its bunker coal.

THE Southern Pacific Co. is about to build erecting works at Oakland to replace those recently burned at San Pedro. The erecting tanks and a good deal of the machinery can be so repaired as to be used again and will constitute a part of the new works. The new plant will be located near the foot of Peralta street and near the present ferry-slips for the freight steamers. In the future all the piles used in the company's wharves about the bay and at San Pedro will be treated to the creosote process here. A great deal of the bridge timber used by the company is also treated to this process. The erection of the works in Oakland will represent an investment of about \$25,000.

THE Salinas natural gas well is well started and everything is working in first-class order. It has reached a depth of 83 feet through the following deposits: Alluvium, 4 feet; yellow clay, 6 feet; yellow sand, 8 feet; yellow clay, 3 feet; yellow quicksand, 18 feet; yellow clay, 16 feet; blue sand, 5 feet; blue clay, 10 feet; yellow clay, 10 feet; brown vegetable mold, 3 feet. At the depth of 70 feet, after passing through the stratum of blue clay, which turned to yellow near the bottom, the first gas was struck but not in very strong volume. At the depth of 83 feet a strong flow of gas was struck, but the well soon filled with water from below. From a depth of 39 feet to the 83-foot point, no water was found.

FOR the first time in its history the Southern Pacific Company has suffered damage to its property from an earthquake. When the hardest of the shocks of last week occurred, the iron truss railroad bridge over the Pajaro river on the coast division was moved out of place about a foot, preventing the passage of trains. During the morning passengers had to walk across the bridge and take trains sent to meet them. The bridge remained on its stone piers and was safe after the rails were moved into line, which was done. The bridge is near a fissure through the mountains through which the Pajaro river runs, and the earthquake caused the river to rise four feet, and made long rents in the mountain-sides near by.

THE Consolidated Piedmont Cable Co. has been formed in Oakland. This new corporation has a Board of Directors composed of Daniel Meyer of San Francisco, Ira Bishop, representing Charles Bishop, hanker, Honolulu, Mrs. Phoebe A. Blair, relict of J. Walter Blair, Samuel and Montgomery Howe, E. A. Heron and W. B. Morse. Fifteen and one-half miles of cable road are to be constructed. This new organization absorbs the following horse-car lines: Washington street via Fourteenth street and Broadway, to Piedmont and the cemeteries, Washington street via Fourteenth street to Watts' tract; Sixteenth-street depot and Seventh street, West Oakland; also the Market street and Adeline street feeders. When the system is blended, as it soon will be, transfer tickets will be issued. Just now the Piedmont section, running on Washington, Fourteenth and Broadway, is being converted into a cable road. About 300 men are at work on that job.

THE *Virginia Chronicle* says: John W. Mackay is at the head of the movement for the proposed reduction in handling Comstock ore after its extraction from the mines. The Comstock Tunnel Company officials have intimated a willingness to agree to a reduction in royalty, provided the V. & T. railroad and mill companies consent to reduce the cost of transportation and milling. That the latter will be forced to either consent to the reductions proposed or suspend ore shipments and hang up their stamps there can be no question, as it was demonstrated at the conference that the vast low-grade ore resources of the Comstock must remain in the mines if the present rates for handling are maintained. On the other hand, if the proposed reductions are consented to, the hullion yield of the lode will be increased to double the present average, thereby furnishing a larger revenue for the railroad and mill companies and giving employment to double the present force of miners and millmen.

IN consequence of the severe winter season, dull market and the usual depletion of the great streams flowing into the Pacific, the salmon pack this year is likely to be materially curtailed. It is thought that it may require one or even two years of recuperation, owing to the dullness of the market, before the haul is pushed to an extent equal to the two years last passed. John T. Cutting, in speaking of the salmon business, said: "The Sacramento canned salmon has ceased to cut any figure in the market whatever, owing to the almost utter extinction of the fish in its waters. The Columbia river also has lost the commanding position it once held in the market, owing to overfishing, and now that ample supplies can be procured from Alaska and British Columbia, the product from the Columbia has ceased to exert the influence upon the market that it did. The situation on the Columbia can best be shown by considering the decreased number of the canneries at work on that stream. In 1889 there were twenty-five, this year the number will not exceed fifteen, and of this number there are now only one or two of the upper river canneries in operation."

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 22, 1890.

425,972.—CLOSET ATTACHMENT—R. V. Baraco, Fresno, Cal.

426,167.—WAVE MOTOR—E. Chaffey, Santa Monica, Cal.

426,245.—ORE FEEDER—L. D. Craig, S. F.

426,267.—FRUIT PICKING STAND—J. C. Greenlow, Pepperwood, Cal.

426,016.—KEY FASTENER—W. W. Hitchcock, Los Angeles, Cal.

426,017.—HYPODERMIC SYRINGE—W. W. Hitchcock, Los Angeles, Cal.

426,033.—AUTOMATIC FLUSH TANK—A. Mayer, Pasadena, Cal.

426,034.—AUTOMATIC FLUSH TANK—A. Mayer, Pasadena, Cal.

426,208.—SACK HOLDER—Alex. McDonald, Franklin, Cal.

426,312.—RETAINING DEVICE FOR OVERSHOES—J. A. Patton, San Diego, Cal.

426,280.—ANVIL ATTACHMENT—C. M. King, Downieville, Cal.

426,025.—FLOOR TIGHTENER—W. P. King, Los Angeles, Cal.

426,352.—SHEET-METAL FOLDING MACHINE—S. F. Woodward, Clapper Gap, Cal.

The following brief list by telegraph, for April 29, will appear more complete on receipt of mail advices:

California.—J. G. Eastland, assignee of a one-fourth interest, S. F., fire alarm; Albert A. Weber, Sacramento, self-oiling car axle; William P. Walling, Santa Monica, elevated cable road; George W. Thurston, S. F., fruit-drier; Thomas A. and H. W. Perlan, Sacramento, dish-washing machine; Samuel H. Pratt, Strawberry Valley, lung-testing toy; William B. Peters, S. F., assignor of a half interest to R. C. Sargent, San Joaquin, dredging machine; Radford W. Peterson and S. B. Clark, Santa Rosa, top-pickler; Thomas Isaac, Sacramento, calipers or dividers; Daniel F. Jones, S. F., safety plug for wash basins; James Kelly, assignor of a half interest to E. Dougherty, San Diego, vent-stopper for ordnance; same, device for laying guns at any angle; William H. Grissim, Santa Rosa, measuring funnel; William Holland, Gilroy, shaft for vehicles; Peter B. Donahoe, Fresno, watering-cart; Charles F. Elliott, S. F., method of and apparatus for purifying water for boilers; Edward A. Cochran, assignor of a half interest to C. A. Sawtelle and E. J. Beach, Pasadena, horse-clipping machine; Jessie Buody, San Rafael, mixer-box; Frank Bardez, S. F., faucet-filter.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Handling Comstock Ores.

EDITORS PRESS:—Your correspondent is here looking around the mines. Since this city has fallen under control of the low-grade millmen, the monotony of life is only equalled by the quietness of its surroundings. An occasional break to the stillness is had when one of the numerous superintendents returns for a brief visit from his foreign travels.

Mr. Pat Kirwin, Supt. of the Gould & Curry, put the town in a flutter this week by his unexpected arrival from Mexico, where he and the president of the company have been luxuriating. No wonder the mines are assessed in place of paying dividends.

A mining man of Gold Hill is responsible for the information that the Overman has a ledge of good ore on 1200 level which has been sampled across the face and found to be 12 feet wide; these samples show an average of \$32.50 per ton. By mixing this with stuff containing little or no mineral, the battery samples are reported to stockholders to be around \$17 per ton. Universal dissatisfaction led to be heard on all sides against the complete silence of the *Virginia City* press upon these too apparent subjects of millmen handling the ores, hot at the mine and at the mill, with no check upon their acts. Everything is shaped to fit the mills. I am told that most of the Gold Hill mines do not consider it necessary to make mine assays for the benefit of their stockholders, but simply dump their ores to the mills. The question of quantity and quality is of little moment to them, so long as the mills are kept running. A radical change must take place, or dividends will never be paid on these mines again. Freight and milling should be reduced. But these are very small items when confronted with the fact of the very imperfect system of checks, as existing between the mine corporations and the mill corporations. They are both incorporated under the laws of California, and the barefaced violations of the laws made to govern such corporations by your State should not be permitted another day.

The stockholders interested in the mining corporation are sacrificed upon every side by their agents for the benefit of stockholders interested in mill corporations. Just why this should be allowed to continue when a half-million of our California and Nevada people have greater or less interest in these mines is a profound mystery. The violation of the law is to be met in every mining corporation that refuses to keep a proper check on ore shipped to mill and its value. The manipulation of freight bills on ore—all in favor of the mill corporation—is costing the mining corporations thousands of dollars yearly. This freight is another very small item when compared with the manipulation of ore assays, all of which favor the mill corporation to the loss of the mine. Again, the mill corporations are allowed to keep all tailings and slimes, which, if the truth be told, are altogether too valuable to be surrendered so willingly by the stockholders of the mines.

Most of these mines could pay dividends today if they were honestly and economically worked. Until the same respect is paid for the

mine stockholders' property as is now given to the mill stockholders your readers can expect no dividends from the Comstock mines. X. Virginia, Nev., April 26th.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

Attention, Southern California Miners.

WORKS FOR SALE.

The Works are situated at Daggett, Cal., in the Calico Mining District, and on the side-track of the Atlantic and Pacific Railroad. They contain a first-class 50-horse power Engine and 45-horse power boiler, with Ore Crusher and other machinery, Mill Scales, Assaying Outfit, etc., all nearly new. Also upon the premises an office building and a comfortable dwelling-house (portable). The above can be had at a bargain. Apply to GILLISPY & CHILDS, 123 California St., San Francisco.

CHEAP AND CONVENIENT CHAIN PULLEY

The engraving herewith illustrates a new lifting apparatus of that kind in which great power is necessary, and which will stand and hold the load at any point where it is left. As the engraving shows, there is a pulley over which the lifting chain passes, and upon the same shaft two gear wheels, so fixed that their teeth alternate—that is, the teeth of one wheel correspond with the spaces of the other. The pulley on the right, over which the endless actuating chain passes, is fixed to a shaft, which has short crank arms formed upon it, correspond with the gear wheels and with the size of their teeth, so that when the shaft is rotated the crank arms or pins engage the teeth of the gear wheels, one after the other, and thus advance the chain pulley. This device also forms a perfect lock when left at any point.

The hoisting-chain pulley, placed between the large gear wheels, brings the weight right under the supporting-hook and balances the machine. The operator may stand on one side and haul on the chain and need not be right under the apparatus. The device is simple, compact, strong and efficient, and is quite ingenious in design. These machines have lately been put on the market and are made here. The invention evidently improves, in a large degree, the construction of differential chain pulleys, makes them less in cost, weight, wear, and repairs, and easy of handling and operating. The new device is worthy of the attention of manufacturers and all users of such articles. The size for a half-ton lift weighs only about thirty pounds.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

J. POOLEY.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 1, 1890.

General trade has held fairly active throughout the week. From the mining districts all advices are confirmatory of more prosperous times than have been enjoyed for several years past. Advices from the agricultural districts are also of an encouraging character. The only present drawback is the labor agitation and threatened strikes by several labor organizations. For all of five years past we have been singularly exempt from strikes, but now they appear to have come on with renewed energy. Iron manufacturers are quite confident of success, which will place them in position to compete for work that has gone East; at any rate, they will not lose money, as they had been doing.

The money market is fairly easy, with no urgent demand from any one quarter, while remittances are free. The wool clip moves off freely, which is putting considerable money afloat; while free selling of grain unites large sums of money. Sterling exchange is firm, as are exchanges on New York. The last steamer leaving for Hong Kong took out 157,156 Mexican dollars, \$7010 gold coin and \$50,000 silver bullion.

MEXICAN DOLLARS—The market continues strong at fluctuating prices in sympathy with silver bullion. The demand is slow. Quotations the past week ranged from 79½@80c, closing at about one-half cent lower.

SILVER—The market at the East and abroad advanced and held fairly strong the forepart of the week, but with the prospect of no speedy action by Congress looking to favorable legislation on the metal, the price set back. The firm stand of Senators Teller and Stewart in favor of free coinage, ably seconded by Hon. Francis G. Newlands, encourages the belief that with the aid of the Democrats far more favorable silver legislation will be secured. It is to be regretted that the Republicans are trying to make it a party measure, for the re-monetizing of silver should rise above party, owing to the many industries that will be largely benefited directly by it, while the others will be benefited indirectly. Our foreign exchanges point to an almost certainty that with silver re-monetized in this country, the nations of Europe will soon fall into line. Although silver is about 10 per cent higher than it was a few months ago, yet very little is offering for sale, which shows that the production is not increasing.

London cables came through to-day quoting silver unchanged, as did New York telegrams. In the latter city \$1.03 was bid to-day for silver certificates. In our market the mint paid \$1.05, which was reduced to \$1.03½, and to-day they bid \$1.02.

QUICKSILVER—Receipts the past week aggregated 75 flasks, and exports by sea 152 flasks to Guaymas. The market is very strong at higher prices, under a good demand and better prices abroad.

ANTIMONY—The market continues strong under light stocks and small obtainable supplies at the East.

BORAX—Receipts the past week aggregated 216 casks, and exports by sea 200 lbs. to Honolulu and 1160 lbs. to Guaymas. The market is firm at the recent advance.

LEAD—Exports the past week aggregated 7000 lbs. to Victoria. Owing to the new ruling of the Treasury regarding the importation of Mexican ores, the market at the East has been advanced. The demand East is reported to be more active.

LIME—Receipts the past week aggregated 6976 bbls., and the exports by sea 1230 bbls. to Honolulu and 400 bbls. to Kahului. The market is fairly active at full rates.

TIN—The market has a firmer tone, under a freer consumption and stronger prices abroad for block. The higher market for pig abroad and at the East is due to a lessened output by the mines.

COPPER—The market is very strong. At the East there has been a steady advance, due to favorable markets abroad. Cable advices from London up to April 23d report as follows: Copper warrants are becoming scarcer, as the French stock are still held firmly for £50. Other sellers have offered more freely at intervals, but there is little outside speculative demand. The India demand, which has lain dormant for a long while, is beginning to revive somewhat, and there is at present a fair business in that direction. Recent transactions in furnace material include a total of 2250 tons Anaconda argenteiferous matte on private terms and 195 tons Montana matte at 10s. to arrive.

IRON—The market is reported fairly firm. Manufacturers are reported to be using more, with the prospect of enlarging their requirements still more at an early day. Eastern advices report continued strong competition by Southern furnaces. The production of the South increased from 688,000 tons in 1887, to 1,244,000 in 1889, while the output of the North only increased about 28 per cent within the like time. A London cable under date of April 23d to the Iron Age, says: Hematites dropped to 53s. 7d. in the face of reports that another meeting of West Coast smelters has been held at which it was agreed to damp more furnaces, and despite the fact that shipments are large and stocks decreasing under the influence of the same and reduced make, confidence seems to be entirely absent as a matter of fact, and little interest is manifested except on the part of sellers operating on the "bear" side.

COAL—Imports the past week aggregated as follows: Departure Bay, 8600 tons; Seattle, 1217; Coos Bay, 1600; New York, 100. Total, 11,500 tons. The market for Australian for shipment is gradually easing off, owing to lower outward charters at Australasian ports, and advancing outward charters at this port. The list of ships on the way and loading at both Newcastle, N. S. W., and Sydney is increasing in numbers. The consumption here of steam coals is steadily increasing. House coals are slower but no lower. The consumptive demand is gradually decreasing. The market is fairly steady.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 1, 1890.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday	47	1 05	\$14 35	\$4 02½	\$20 10
Friday	48	1 05	14 50	4 05	20 15
Saturday	48	1 05	14 35	4 05	20 50
Monday	48	1 05	14 40	4 02½	20 50
Tuesday	47	1 05	14 50	4 07½	20 35
Wednesday	46 9-16	1 01½	14 50	4 10	20 25

NEW YORK, April 29.—Borax, moderately active; 9½@9¾c for California, refined. Quicksilver, 69@70c; London, firmer in all hands; a good spurt and activity. All styles of lake copper firm; 14½c bids rejected. Casting brands something stiffer. Arizona, 12½@12¾c for most any other than common. There is a revival of the trade in lead in the East and West. Prices higher here. Spot, \$4.07½@4.10.

Assessment Notices.

GOLD HILL MINING COMPANY—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 17th day of April, 1890, an assessment (No. 9) of Twenty-five Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States Gold Coin, to the Secretary, at the office of the Company, Room 20, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY the 10th day of June, 1890, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors

C. A. GROW, Secretary,
Office, Room 20, Phelan Building, San Francisco, California.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC BORAX, SALT and Soda Company, San Francisco, April 30, 1890. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 31) of One Dollar (\$1.00) per share was declared, payable SATURDAY, May 10, 1890, at the office of the Company, No. 230 Montgomery Street, Rooms 11 and 12. Transfer Books close May 5, 1890, at 3 o'clock P. M.

ALTON H. CLOUGH, Secretary.

12 Cortlandt St., New York.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ores by the now patented **DRY AMALGAMATING BARREL PROCESS**. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the **FREE GOLD** yield of any mill working **WET**. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringements. For further particulars, address

ALMARIN B. PAUL,
Middle Creek P. O., Shasta County, California.

THE AMERICAN BARREL PROCESS.

I hereby certify that I made, at the Calaveras mine, a comparative test, as between stamps and silver plates working **WET** and the Paul Barrel Process working **DRY**. The quantity of ore worked was 72 tons, all carefully divided and weighed for each test. The result from 36 tons worked by stamps **WET** was \$24.05 per ton. The result from the 36 tons worked by the Paul process **DRY** was \$92.00, making a difference of \$67.95 per ton in favor of the Paul Process. The test was as exact as it was possible to make it.

GEORGE BOWEN,
Room 6, 302 Montgomery St., San Francisco.

FOR SALE CHEAP.

One new double circular Sawmill to carry 60-inch bottom saw, with wrought-iron hangers for top saw. Friction feed-works, patent steel screw double-throw head-blocks, with track iron, saw carriage and frame complete.

THE ZANDER LAMP-BURNER.

No Trouble to Put in the Wick.

This Patented Burner has a slide-plate *b* on the wick-tube *B*, with grooved flanges *b'*. The slide-plate is removed from the tube *B* and the wick inserted through the open side, the wick edges being easily pressed in past and under the edges of the tube. The slide-plate is then put back, fully inclosing the wick. With this it is unnecessary to force the wick through a closed tube and past its ratchet wheels. **THIS PATENT IS FOR SALE.** It is one of those every-day-use practical inventions of merit that will take. Address **LOUIS ZANDER, 1223 Twenty-first Avenue, East Oakland, Alameda Co.**

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

[Signed] Supt North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work
claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER
INJURE THE IRON.

CARNEGIE BROTHERS & Co., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, }
PITTSBURGH, PA. WORKS AT BRADDOCK. } Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have
tested nearly all Compounds presented to us, and this one is the only good thing we have ever used.
Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150
degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of
lime, mud, and everything that is bad. Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than
the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA,
SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who
are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for
all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby
made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth,
Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the
great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given
to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway
Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central
Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern,
Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT
THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel,
or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT }
{ PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

TATUM & BOWEN,

THE WORTHINGTON COMPOUND STEAM PUMP.

The Worthington Pump.

The Worthington compound steam pump is made in various sizes and patterns according to use to which they are to be applied. The compound cylinder is recommended for any service where the saving of fuel is an important consideration. The compound cylinders are extensively applied to hydraulic elevator pumps, tank, fire, pressure and mine pumps, and to engines designed for the water supply of small cities and towns. In the past six months, the agent, Mr. A. L. Fish, has supplied a number of large plants on this coast. In San Francisco, he has put in the pumping plant for the new Chronicle building, the Palace hotel, and the New California theater. The Hotel Vendome at San Jose and the Hotel San Rafael have also been supplied with these pumps. A large plant has been put in at Seattle, with a capacity of 3,000,000 gallons; one at Tacoma, 3,000,000 gallons; at Olympia, 2,000,000; at Alhio, O., 1,500,000; Woodland, Yolo county, 1,000,000; Vallejo, Solano county, 1,000,000; and Mazatlan, Mexico, 4,000,000 gallons. These are only a few of the contracts made since November last. This pump is distinguished for great simplicity and strength of construction, having few moving parts with no harsh motions. The parts are easily accessible for repairs.

Sutter's Fort.

Sutter's Fort, in Sacramento, is one of the few historical buildings in California. It is still standing and is to be restored. Before the discovery of gold it was a most important station in the upper part of California, for it was there that General Sutter and what few white men were here had their headquarters. It was at this place, too, that James W. Marshall, the discoverer of gold in California, whose statue was unveiled last week, first went to work for General Sutter. He was sent by Sutter to the mill at Coloma, and found the nugget which caused the gold excitement of 1848-49. This nugget he took to Sutter at Sutter's Fort, and after a few tests the discovery was made public.

The sketch on this page shows the appearance of the Fort in 1849 at the time of the influx of gold-hunters to this State. Lately, steps have been taken by the Native Sons of the Golden West to preserve what is left of the buildings for the benefit of the public, and the grounds are to be set aside as a park.

At Corrick's mine, near Temperance Flats, Fresno Co., J. M. Corrick was shot and killed by his son-in-law, Henry Sullivan. The parties to the tragedy had been at law about the ownership of a mine, and after the case had dragged through the courts for several months, it was decreed that Corrick was the owner of the property. Corrick went up to the mine about two weeks ago, and was at work when shot.

The Virginia City papers announce that the owners of the California battery and stamp-mills have concluded to dismantle them this year on the score of economy, as it has been demonstrated that the cost of operating them, either by the wire-rope system or steam power, is greater than that of operating the Carson river mills.

Mazatlan, Mexico, is now supplied with water through steel pipes from a source 20 miles distant. D. Ernest Melliss of this city is the constructing engineer of the works.

The amount paid out for wages alone last month by the Comstock mining companies was \$234,495. The highest hill was that of Con. California and Virginia—\$53,885.

At Livermore, Alameda Co., work was commenced this week on three drifts from the main tunnel in two veins in John Treedwell's Enreka coal mine, and the force has been increased to 60 men. The main tunnel is now in 1500 feet, which is about half-way to the summit vein.

SIDNEY M. SMITH has been elected vice-president of the Regan Vapor Engine Co. of 221 First St., this city, and has not displaced Francois Cutting as president as stated in the Press last week.

The Comstock yielded the first quarter of this year \$1,245,516. Ore shipments were entirely suspended for some weeks during the snow blockade.

SKETCH OF SUTTER'S FORT IN 1849.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—*Eds.*

The Foundry at Sonora.

EDITORS PRESS:—It may be news to some of your readers who are interested in mining, who reside in the city, to know that in our mountain town we have a foundry in full operation and most successfully administered, which is of paramount advantage to all persons actively engaged in developing our quartz lodes. Here, any kind of machinery, from a coffee-mill to a quartz mill, can be made at San Francisco prices, and the castings I have this day examined show a smoothness and finish comparably as perfect as any city work. Further, the owners guarantee to give satisfaction. The proprietors of the foundry are Messrs. Romans & Patterson. The first gentleman is an expert pattern-maker and designer, as well as business manager. He is an old resident of Sonora, and is well and favorably known for his upright conduct in business. The other partner, Mr. Patterson, is a first-class mechanical engineer, and came from Virginia City, buying into the foundry quite recently. He was chief engineer in the Combination shaft on the Comstock and Alta Company, and further acted in the same capacity at the New Almaden mines (quicksilver). Again, he superintended the laying of the water-pipes from Oakland to San Francisco. The foundry is fortunate in securing the services of such a thoroughly capable man, and one so skilled at the lathe.

I will now briefly describe the shop and its surroundings. There are three lathes, 10, 12 and 30 inches, planing machines, drills, boring-mills, two blast smelting furnaces, capacity 5 and 1½ tons respectively; two brass furnaces, with all the necessary equipments for a first-class foundry—all driven by a 30-foot over-shot water-wheel. There is a spacious molding floor 30x60 replete with all the modern improvements, and a natural deposit of very valuable plumbago and near at hand that is made available for molding. There is a pattern room and a fireproof pattern-house literally full of patterns of all kinds and descriptions. This foundry has become noted for its very superior shoes and dies, being composed of a certain mixture of steel, white iron and wrought, the exact proportions being a secret of their own; suffice to say, they are thoroughly toughened, wear evenly, are not brittle, and actually last longer than the Pittsburgh steel shoes—in fact they are pronounced far superior by those that have used both. It is only by long and continued practice and experience that they have arrived at such perfection. It is well for us here that our cash can be kept in the county instead of sending it East or even to your city, for the raw material you must provide us with at any rate, so live and let live. I noticed they have just completed a seven-foot double-grooved sheave for the Golden Gate mine here and are finishing a five-stamp mill for Angels Camp, Calaveras county. This foundry's gold mortars are a specialty, being cast with the minimum amount of iron, and from long use by gold-mill men they prefer them, being incontestably more convenient and suitable for gold rock than the ordinary huge patterns, which are really silver mortars. These mortars are constructed to receive wooden housings, which have the advantage over the latter in cleaning up or in changing and replacing the worn shoes and dies, and for inside amalgamation they are perfect.

Sonora, Tuolumne Co.

Road Work in Mendocino County.

EDITORS PRESS:—In a communication to the PRESS a few weeks ago I dwelt somewhat on methods of road work now in vogue, and on the advantages of the contract system. Since that time the Board of Supervisors of Mendocino county have been in session, and in passing on a number of petitions from road districts in which the petitioners pray that the roads in their respective road districts be let by contract, laid down the principle that, in their opinion, the wishes of a majority of property-owners in any road district should determine whether said district should be worked by contract or by the old system. This is, I believe, as it should be, and will pave the way for a fair trial of road working by contract, in Mendocino county. Considerable care will be needed in drawing up the form of contract so as to protect the public and at the same time give the contractor a fair show.

There would be no injustice at the beginning if the contract prices were fully up to the average cost of road work for two or three years past in the road district let, as a contractor would have unusually difficult work for the first year of his contract. It is to be hoped that the contract system will be given a fair trial in most of our counties this year. The present system seems a hopeless one.

Passing this question, there is another which deserves more than passing attention, and that is the manner of survey made for a new road. In no branch of county business is there more false economy shown than right here. Everything in building a new road depends on its being laid out on the best and easiest line, and in the survey itself being an exact and scientific

operation. Every unnecessary rise or fall is a tax on travelers as long as the road exists. Travel where you will, through the hilly or mountainous sections of California, and you will see roads which show bad work, paralleled by abandoned roads on still worse lines. It by no means follows that because a road is easy it need cost one cent more to build. To properly survey a road requires two kinds of knowledge. The first is a knowledge of the lay of the country through which it is to be built. This the resident usually has. The second is the actual skill of a surveyor and road engineer, a man who, possessing tools for careful work, has also the knowledge of practical engineering to make the most of the nature of the ground over which a road is to be built.

Now the first sort of knowledge is plentiful enough, but practical road engineers are neither plenty nor very cheap. Yet when we compare the cost of employing the best of road engineers with that of building roads which are a perpetual and unnecessary inconvenience to the public, and which more than likely will at some later date have to be abandoned for an easier grade or more direct route, the former sinks into insignificance. It would pay the supervisors in any county to employ as surveyor for a new road the best civil engineer that they could secure even at a cost five times as great as for surveyors who have no particular knowledge of the science of road engineering. Associate with such an engineer men who have a thorough acquaintance with the country to be traversed, and there would be a reasonable probability that the road so surveyed would be permanent, and would not cost in changes more than the original cost.

Throughout California the traveler is impressed by the vast amount of money wasted on roads now abandoned. In one instance I know of three grades paralleling one another within 200 yards, and that, too, on an open hillside on which a half-mile grade was to be made. Roads could have been made and macadamized for a less amount than has been squandered in such instances. Nor is this ancient history. The mistake is being constantly repeated. A new road is to be laid out at a cost of \$5000. Let us see how it is done.

The Board of Supervisors appoint three men as viewers—one a young man who has a smattering of surveying and who, with the compass, which is his only tool, can run a line or find a section corner, and on that bases his title to the name of surveyor; the other two, farmers or stockmen to whom we can allow even an annual amount of sense in the line of their business without acknowledging any qualifications as road-builders. These three men, with scarcely any instruments, survey a road, it is accepted and \$5000 expended. Is this business? Is the building or planning of a good road over such difficult country as is the rule in much of California, such a simple matter that a surveyor possessing the knowledge for doing only the simplest of work in land surveying, and two other men who, however shrewd generally, are not even by courtesy road-builders, can do it well? We think not; and yet I have, if anything, stated the case too kindly to be a truthful account of how such work is done, not particularly in Mendocino county, but all over California.

CARL PURDY.

Ukiah.

Gold and Silver Product.

Mint Director Leach has submitted to Congress a report on the production of precious metals for the year 1889. The gold product of the United States was 1,587,000 fine ounces, of the value of \$32,800,000, as against \$33,000,000 the preceding year. Of the gold product \$31,959,047 was deposited at the mints for coinage and manufacture into bars. The silver product was approximately 50,000,000 fine ounces, of the commercial value of \$46,750,000, and the coinage value of \$64,646,464, against an estimated product for 1888 of 45,733,632 fine ounces, of the commercial value of \$43,020,000, and the coinage value of \$59,195,000. The increase over 1888 was about 4,216,368 fine ounces, of the commercial value of \$3,730,000.

In addition to the silver product of our mines, about 7,000,000 ounces of silver was extracted from lead ores imported into the United States and smelted in this country, and over 5,000,000 ounces from base silver bars imported, principally from Mexico, making the total product of our mines, smelters and refineries about 62,000,000 fine ounces of silver.

Of this amount the Government purchased for coinage 27,125,357 ounces; there were used in the arts about 6,000,000 ounces, and there was exported to Hongkong, Japan and the East Indies about 9,000,000 ounces. We shipped to London for sale about 20,000,000 ounces.

Colorado still maintains the first rank among the producing States, with an aggregate product of gold and silver of over \$24,000,000. Montana stands next, with a product of \$22,894,000. California produced \$14,034,000, of which \$13,000,000 was gold, being about two-fifths of the total gold product of the United States. Utah shows a largely increased product, notably in silver. Idaho and New Mexico report an increased product, and Arizona and Nevada reduced products for 1889. The gold product of South Dakota increased from \$2,600,000 in 1888 to \$2,900,000 in 1889.

Oregon and Washington both report increased products, the former having produced \$1,200,000 in gold. The States of the Appalachian range show a slightly increased product of gold over 1888.

The total value of the gold deposited during the calendar year was \$48,903,072, of which \$42,599,206 was new deposits and \$6,303,866 redeposits. The total deposits and purchases of silver aggregated 36,297,584 standard ounces, of the coinage value of \$42,237,165, of which 36,074,212 standard ounces, of the coinage value of \$41,977,265, was in new deposits. The quantity of silver purchased for silver-dollar coinage was 27,125,357 fine ounces, costing \$25,379,510, or an average cost of 93 56 cents per fine ounce. The amount of silver offered the Treasury Department for sale aggregated 47,965,700 fine ounces.

The net loss of gold and silver to the United States by excess of exports over imports was as follows: Gold, \$38,886,753; silver, \$14,788,666; total, \$53,675,419.

The amount of gold and silver used in the industrial arts during the calendar year 1889 in the United States was: Gold, \$16,697,000; silver (coinage value), \$3,766,000; total, \$20,463,000. The amount of domestic bullion used in the arts was: Gold, \$9,686,827; silver (coinage value), \$7,297,933; total, \$16,984,760.

The total metallic stock of the United States is estimated to have been on Jan. 1, 1890, as follows: Gold coin and bullion, \$689,275,007; silver coin and bullion, \$438,388,624; total, \$1,127,663,631.

An Important Measure in Forestry Reform.

Hon. Thos. J. Clunie, in response to public sentiment and the magnitude of the irrigation, mining and lumbering interests of this State, prepared, and on March 20th introduced, H. R. bill 8459, providing for the proper and systematic administration of the public timber lands of the United States lying west of the 97th meridian of longitude. Briefly, Mr. Clunie's bill provides first, for the temporary withdrawal of all timber lands; second, its classification into three groups, to wit:

Section 1—Lands distinctively forest and of more value for the commercial worth of the timber thereon than for other purposes.

Section 2—Lands more or less timbered, but of greater agricultural than forest value.

Section 3—Forest lands of direct use in preserving existing hydrologic conditions, watersheds, etc.

Provision is made for the return of lands of second section to the Department of the Interior as subject to sale or occupation under existing laws. All others are declared to be forever the inalienable forest reserves of the United States.

Provision is made for a forest commissioner and four assistants, who shall be "proper persons, versed in matters pertaining to forestry," and who shall be required to give practical oversight to and direct the care of the forest districts to which they may be assigned.

To encourage and stimulate our great lumber industries, provision is made for the sale of timber (by stumpage) upon lands of the first and third classification, subject only to such reasonable restrictions against waste and despoliation as the commission may impose. Fines and punishments are provided for licensed timber or fuel cutters who violate the regulations of the commission; and likewise against depredators and trespassers upon these reserves.

In view of the heavy revenue that will pass through the hands of the commission, commensurate bonds are properly exacted of them; also an annual report to Congress. One of the strongest features of the bill is one providing that this commission shall be within the Department of Agriculture, an assurance itself to irrigators and farmers that their interests will be closely watched.

Mr. Clunie, while closely following the general recommendations of the California State Board of Forestry in its recent memorial to Congress, has elaborated the details of a most comprehensive and admirable forestry bill, not alone creditable to himself, but calculated to serve all the interests involved—antagonize none. Amid the mass of legislation now before Congress bearing upon the reclamation and irrigation of waste and arid lands, none is more germane to the matter than this bill, nor more practical and statesmanlike in its application.

Patriotic pride in California, her magnificent forests, stupendous irrigating systems and her resources, should lead us to unite with Mr. Clunie in desiring to place the State on record as a pioneer in this direction, and it is to be hoped that he will have the unqualified indorsement of both press and the public, with all the influence they can bring to bear upon the Committee on Arid Lands, tending to the adoption of this bill.

This measure has been submitted to a sub-committee of the House, composed of Lewis F. Watson, chairman, Pennsylvania; Erastine D. Turner, Kansas; Jos. M. Carey, Wyoming; John Quinn, New York.

Friends of forestry, and those coinciding in thinking that our State should receive due attention upon this matter, are invited to communicate with this committee, urging upon them consideration of the merits of Mr. Clunie's bill, and advocating its passage.

The Deep Gold Placers of California.

NUMBER VI.

Written for the PRESS and Copyrighted 1890, by HENRY G. HANKS, F. G. S. A., F. G. S. J.

Physical Condition of the Gold.

I have in my collection two remarkable specimens, silent witnesses of forces so long employed in the production of the deep placers of California. Both were found on the bedrocks under the gravels. One is an amber-colored chalcedonic pebble showing indisputable marks of attrition. It has been broken and the hollow interior exposed; into the cavity small pebbles of dark-colored quartz have been forced by an unknown power; these cannot now be removed without breaking the chalcedony. The edges of the chalcedony have since been rounded, showing that the action was not recent.

The other is an elongated pebble of argillaceous slate, honeycombed with thin seams of a fibrous undetermined mineral. In several small cavities little rounded grains of gold have been placed, presumably by the same force that put the quartz in the hollow chalcedonic pebble. This gold is not in any way attached to the pebble except by pressure; the grains are of usual and well-known placer gold, and have to all appearance been placed in the cavities mechanically. Any doubt as to their being true placer gold is removed by examination under the microscope, when they are seen to be coated or rusty.

The quantity of fine gold in mispickel and pyrites in the veins and the bedrock of the deep placer region, is vastly greater than in the quartz in a free state. This is mostly lost to man after it is set free by natural causes, for the reason mentioned before; it is so finely divided that it escapes all known processes invented for its capture.

It is not uncommon to find by assay 20 ounces of fine gold to the ton of pyrites; while these minerals without gold are almost unknown in California. When we consider that practically all the iron so abundant in the deep placers is derived from pyrites, we may realize what an enormous quantity of the precious metal has gone to waste by this wide gateway.

When the gold is set free, being in a condition to float, it is lifted by the turbid waters of mountain torrents, borne away and scattered far and wide.

It is a fact well known to miners that the proportion of gold, bulk for bulk, is greater in narrow than in wide mineral veins. Some veins, so thin that they are called "knife-blade veins," are worked with profit by a system known as "oreveiling." A notable example of this style of mining may be studied in El Dorado county, where such veins contain the rare mineral rosacelite, never more than an inch in thickness and generally far less, and all the gold is concentrated in it.

Gold in the Eiman mine, Plumas county, is ragged, and while generally finely divided, is evidently comparatively recently released from the matrix. As an additional evidence of this, when examined microscopically, quartz is found attached to the gold. At Soap Point, also in Plumas county, and near the Eiman, nuggets of unusual size are the rule, and they are all hattered and flattened. Gold in rivers near the sea, and in the ocean beach sands, is bright and lustrous and entirely free from coating; it all amalgamates without the least difficulty.

Gold in Glacial Channels Elsewhere.

Australia.—At Ballarat, Victoria; gold was found from 100 to 175 feet deep. In the shafts sunk, water was struck at 70 feet that boiled up like an artesian well, in one instance giving the miners scarcely time to escape. In the Back Creek diggings, gold was found on a bedrock of pipeclay ("Gold Mining in Australia," John Manning, *Overland Monthly*, Vol. III, 1869).

The deep diggings in Bendigo are thus described ("Australia, Victoria. The Colony and its Gold Mines," William Westgarth, Edinburgh, 1853): "The gold is found in pipeclay, which is of a dazzling whiteness. This lying at a considerable depth, is made accessible by sinking vertical shafts. The auriferous matter is white quartz grit. Tunnels are sometimes driven which require to be well timbered; the auriferous grit is a distinct bed from one to two inches in thickness; above this stratum is a thick bed of howlers and gravel, all of pure white quartz, and all of them apparently derived from the same original quartz mass. There was also an ochre colored clay."

In October, 1851, at Ballarat, a blue clay was discovered from which the miners picked out small gold nuggets with penknives. At these localities, the gold grit lay on pipeclay. The true bedrock was never reached, and it was a constant theme of conversation with the miners what might be below this pipeclay. Water was so abundant that it was impossible to sink lower. An instance is related of a miner who sank and perished in the quicksands at the bottom of one of these shafts.

Channels in Australia are called "gutters." Mr. J. B. Lloyd of this city, who mined for some time in that country, informed me that at Ballarat in the Doctor's claim, much gold was taken out from a deep channel ("gutter") which was otherwise filled with gravel and pipeclay.

Switzerland.—Coxe thus alludes to the occurrence of gold in the beds of the Swiss glacial

rivars: "These mountains certainly should also in rich mines of gold and other metals, a remarkable quantity of gold-dust being found in the bed of the Ar and in the various torrents. I can conceive of nothing more fatal to the interests of Switzerland nor more repugnant to the liberties of the people than to have those gold or silver mines traced and opened. A sudden overflow of riches would effectually change and corrupt their manners. It is an incontestable truth that the real power of a country not ambitious of conquest is derived less from the wealth than from the industries of its subjects."

British Columbia.—It has recently been discovered that the boulder olivines of the Stikine river contain gold in quantities that would make its collection by the hydraulic process one of profit.

Ohio.—Channels similar to those of California are found in Ohio. Gold, too, is not absent. (Geological Reports of the State of Ohio, Vol. I, folio 462): "In concluding this subject it may be remarked that the rocky floor of the country is exceedingly irregular, full of abrupt declivities and deep gorges that are either wholly or partly concealed in the drift deposits."

(Geological Survey of Ohio, 1874, folio 70): "In 1868, seventeen dollars worth of gold was taken from Bowling Green township, a mile north of Brownsville, from glacial drift; the largest pieces were the size of grains of wheat. In Licking county, Prof. Andrews reports the quantity of gold is small, but in my experiments nearly every panful showed the color. There is a range of terraces about 50 feet above the bed of Licking river. These terraces are cut through by small streams from the south, and in the narrow ravines gold is obtained from the sands and clay. A jeweler in Newark found gold in small fragments of quartz." Prof. Orton writes, folio 71: "A few years since, the Clermont gold mines attracted a short-lived notoriety. * * * Clermont county has no monopoly of the gold-bearing formation of Ohio. * * * This formation should be called the drift gold-field rather than the Clermont county gold-field. * * * Without doubt one locality is as good as another where gravels have been washed from the boulder clay."

Renewed attention has lately been drawn to this locality and subject. The following is cut from a recent newspaper:

"Gold in Ohio.—A special from Cincinnati says: For several years gold in small quantities has been found in Clermont county in this State, not more than 20 miles from Cincinnati. Inexperienced men have worked over the ground at intervals. About a week ago two experienced miners who had received specimens of the ore from the farm of John Wood in Clermont county, looked over the ground thoroughly, and went to work. They say a discovery like that they have made anywhere in the regions of the West, would attract 2000 miners in 48 hours. Until the arrival of these miners, no attempts were made to tunnel into the hill where the gold was found. So confident are the miners that they have struck a rich lead that they have perfected plans to sink a shaft and at once begin tunneling to the spot whence the surface gold comes."

Indiana—Gold in the Glacial Drift in Indiana (First Annual Report of the State Geologist, 1869, folio 190): "Gold has been found in Franklin county in Sein creek. A common pallid of gravel and sand yielded two to three particles of gold in thin scales never larger than a grain of wheat. The yellow clay is mixed with quartz and chert and associated with black sand. The whole of Greene county is covered with glacial drift."

(Sixth Annual Report, 1875, E. T. Cox, State Geologist, folio 107): "Gold is found in the beds of creeks that flow into Beanblossom. The gold is 24 carats; this fineness is owing to the beating and squeezing to which it was subjected under the ice. * * * The total yield, according to one authority, was \$2900, and by another, \$10,000. The largest nugget found was worth \$1.10."

(Seventh Annual Report, 1876, E. T. Cox, State Geologist, folio 178): "Gold is found in the bed of Muscatatuck with black sand washed down from the glacial drift of the uplands. A small per cent of gold is mingled with the drift throughout the State. In Northampton county, the drift covers the entire area, from 100 to 150 feet thick."

(Eighth, Ninth and Tenth Annual Reports, 1879, E. T. Cox) refer to a great glacier which terminated at the Ohio river. In describing an experimental washing, Prof. Cox thus wrote: "But if hydraulic mining could be resorted to, it is possible that considerable gold might be washed out."

A paper on glacial deposits in Boone county, Kentucky, is quoted in full: "Several diamonds have been found; one weighed four carats. In Morgan county, as early as 1837, D. D. Owens studied the gold mines of Beanblossom creek and reported on them."

(Thirteenth Annual Report, 1883, John Collett, State Geologist, folio 81): "In 1850, some returned Californians observed some black sand magnetite in ravines in Brown and Morgan counties, which they prospectored for gold. Skillful panners could obtain from \$2 to \$3 per day for several weeks. The gold was in thin scales or almost invisible grains; it paid from 50 cents to \$1 per day. The gold was in glacial drift." According to the same author, this drift covers thousands of square miles from 10 to 500 feet in depth. He describes a glacial

formation much like those in California, in which are imbedded boulders of great size.

Channel Filling—Minerals.

Graphite (carbon) is found in some localities with placer gold. The only important locality known is Tusculum county near Sonora, where it has been mined to a limited extent.

Gypsum (sulphate of lime and water).—While this mineral is abundant in the State, it is rare in the placer mines. It is of too fragile a nature to resist the forces that crush harder minerals.

Ilmenite (titaniferous iron) is frequently a portion of the concentrates both of the drift and hydraulic mines, more so in southern counties than in the north.

Iridium, platinum and platinumidum, generally associated, occur in considerable quantities in numerous localities in California. They would probably not have been known had there been no gold mining. The miners often call these metals "white gold" and can with difficulty be made to believe them otherwise. Platinum is more abundant in the northern mines than in those more southerly, yet Butte county, a central one, is a noted locality. It is quite abundant at Cherokee and at St. Clair Flat near Penore, and is found with gold in the beach sands at Lompoc, Santa Barbara county.

Lead.—Metallic lead is frequently and even generally found in cleaning up hydraulic mines in California, but it all comes from shot and bullets which have fallen on the surface of the ground and been washed down into the claims.

Lignite (semi-coal).—Trunks of trees changed to lignite are frequently piped out of the banks in hydraulic mining.

Limonite (hydrrous sesquioxide of iron).—This mineral in a variety of forms is quite abundant both in the drift and hydraulic mines, so much so that at some localities the accumulations of yellow ochre have been extensively mined, and the product sold as a pigment. The quality is very fine, some varieties being equal to the best Roman ochre. Most of the color of the slickens is due to the presence of this mineral. The Georgia "brickbat" is largely composed of limonite, which is true of a similar deposit common in the deep placers of Plumas and Sierra counties.

Magnetite (magnetic iron ore).—This mineral is also abundant at the same localities, and in all placer mines in the State in the form of black sand, and in rolled masses and large boulders in the hydraulic mines. It is almost impossible to pan out a prospect of dirt in any of the placer districts of the State without finding some of the so-called black sand, even when no gold is found in the pan.

Orthoclase (soda feldspar) occurs not in abundance and seldom free, in the hydraulic mines; it is generally one of the constituents of rocks, most frequently pegmatite. It is rather common in San Diego county, and has been observed in Blackhawk canyon, San Bernardino county. I know of no instance of its occurrence in the deep drift mines.

Pyrite (bisulphide of iron).—This mineral is very abundant in the bedrocks underlying the deep placers and in quartz veins. It has contributed a large part if not all the iron in the limonites and other ferruginous channel minerals. It is sometimes found free, but not in very large proportion. It occurs in crystals in the carbonized woods and becomes a part of the cementing mineral which in some localities changes the loose gravels into conglomerates. Its mineralogical character is such that it cannot remain long without change, nor could it resist the conditions which existed in the glacial channels during the ice period. Crystals of limonite after pyrite frequently occur in the bedrocks near the surface, which being broken, show a central portion of the original mineral. These crystals are generally rich in gold, which can be very plainly seen on the fractured surfaces when examined under a microscope objective of moderate power. Some of these crystals are very interesting. Crystals of pyrite are sometimes found on which little bosses of gold have been deposited without any regularity. These are wholly superficial and evidently more recent than the crystals.

Pyrolusite (binoxide of manganese).—This is a rare mineral in the gold channels. The only instance coming under my observation was in the hydraulic mine at Sweetland, Nevada county. Argentine and Momford Hill in Plumas county are reputed localities.

Serpentine (hydrrous silicate of magnesia).—While serpentine rocks are common and abundant in the gold regions of the State, they are so soft that they soon wear away; when broken, masses assume the form of temporary boulders. For this reason they are rare in the uncovered channels and wholly absent from the deep placers.

Stream Tin (cassiterite, oxide of tin).—While it has been announced that this mineral has been found in the gold placers of California, I know of no instance of its occurrence.

Water is very abundant in all the deep placers of the middle counties, so much so that it is next to impossible to work the mines by shafts. Mr. James E. Mills read a paper before the American Institute of Mining Engineers at the Chicago meeting of 1884, in which he gave an interesting account of difficulties he met with in sinking a shaft in American valley, Plumas county. At 14 feet below the surface, the inflow of water was 67 cubic feet per minute. Similar experience has been made time and again in drift mining until it is now the rule to drive a tunnel often more than a mile

in length rather than attempt to work the claim by a shallow shaft.

Zircon (silicate of zirconia).—Zircon has never been found in place in California, but is common both in the deep and shallow placers. The localities are so numerous that it is not worth while to enumerate them. Zircon sand is so abundant that if it had a fixed value, tons of these minute crystals could have been gathered during the era of hydraulic mining. The crystals are so small that one not familiar with the mineral would mistake them for a rather peculiar sand. But when placed under the microscope, their perfection is revealed, and they are seen to be beautiful doubly terminated crystals. Their hardness is so great that they have successfully resisted the forces that ground softer minerals to a powder. I have recently found zircon crystals with gold in the Montezuma mine at Sulphur Creek, Colusa county; but as the formation is undoubtedly sedimentary, the zircons cannot be said to be in place, but were presumably deposited with the sands and silts in the bed of an ancient ocean.

Organic Remains and the Work of Human Hands in the Deep Placers.

Animal and vegetable remains are not uncommon in the deep placers of California, but I have been unable to obtain positive proof of the discovery of any implements used by man, in gravels covered by so-called lava, nor human remains in auriferous deposits in place, in any part of the State. I have for years kept this matter in view and eagerly sought information when instances were announced, but I have always met with an insurmountable doubt when the evidence obtainable was carefully considered and investigated. I am aware that others hold a contrary opinion, but I can only state my own experience.

Prehistoric relics have been found in riverbeds very many times, and on the bedrock of hydraulic mines frequently, but this does not by any means prove that they were placed there by man. On the contrary, it may be assumed that they were used and left on the recent surface and have fallen to the bedrock as the banks were piped away in the course of mining by that well-known process.

Instances have been recorded and seemingly substantiated in which they have been taken out of the gravel, but always, as far as I can gather, from or beneath a talus, and not in the undisturbed lava-capped gravels of the glacial channels.

Prof. Blake held the same opinion; for in a letter quoted in the MINING AND SCIENTIFIC PRESS, Vol. 21, Fol. 26, he thus wrote: "As the reported finding by Dr. Snell of the stone implements under the lava cannot be verified by any one who has long resided near and worked in the tunnels, I am disposed to conclude that Dr. Snell's relics have been washed out of earth taken from the outer slopes or margins of the lava capping, and that they are not as ancient as he believed them to be."

The most common organic remains found in the gravels are vegetable, and consist of the trunks of trees and leaves which have been frequently referred to in this paper. Another instance is stated by Mr. W. S. Chapmans, who informs me that in the Pioneer mine between Slate and canyon creeks, Plumas county, lying near the bedrock, a sandy stratum of pipeclay is found in which are interstratified leaves so perfect that when exposed to sunlight and heat they curl up as recent leaves would under similar circumstances. Whole trees changed to lignite are found on the same bedrock.

Buried forests exist in the glacial drift of Ohio (Geological report, 1870). In sinking wells, leaves, branches and trunks are met with at considerable depth. They are generally red cedar. A specimen recently sent me from this locality still retains the odor of that wood. In Highland county the water from some of the wells is unfit for domestic use, from saturation with organic matter. The following memorandum was sent to me by Mr. D. A. McCord with the specimen mentioned above: "Found in the bottom of the glacial drift on the high benches of the Talawanda near Oxford. This is the only tree found in its natural state. I dug it up myself and know there is no deception. The other piece represents the trees and timber found all through the drift which is in a chaotic state."

Full-grown trees in the glacial drift of California, Ohio and elsewhere prove that the glaciers, extensive as they no doubt were, did not wholly cover the land, but that trees matured in spite of them. In California, all trees so found are either wholly silicified or carbonized to lignite. They are generally conifers, those silicified showing sometimes the characteristic markings. A single tropical palm of considerable dimensions was found in Nevada county in a hydraulic mine. This seems to prove that during the life of the California glaciers, such trees grew in some part of the world, although this one may have drifted in the sea and been cast on the ice-bound coast of our State, as similar trees are now cast on the shores of Alaska by the Japanese currents. Microscopic sections from this tree are a very interesting study.

The reactions that cause the silicification of wood are not very well understood. The change is so complete in the California petrifications that no organic matter remains, but that the changes are gradual is proved by a specimen in a museum in Stockholm, Sweden, seen and thus described by Thomas Thomson ("Travels in Sweden in 1812," fol. 105): "One of the greatest curiosities in the cabinet of the

College of Mines was a large specimen. It consists of a large piece of a tree; in the center it is perfect wood; as we approach the circumference it becomes more and more petrified, and there is a zone more than two inches thick of perfect wood stone. This specimen has been long in Stockholm. Mr. Hjelm knew nothing of its history except that it came from China."

Prof. T. Sterry Hunt, at a meeting of the American Institute of Mining Engineers held in New York, referred to a paper on this subject by himself, and expressed the opinion that the woody tissues were "successively filled and replaced by silica which is set free in a soluble form by the decay of the silicates in the gravels."

The lignites are in a very singular condition. One specimen, to which my attention was called by Mr. J. A. Edman of Plumas county, seemed to be, when first found, a mass of black matter which cut like tallow but hardened on exposure. It is to all appearances perfectly amorphous, but on being cleanly dressed by planing, the wooden texture appears, and so perfectly that the specimen thus prepared seems a block of wood blackened to resemble the bog oak of Ireland. This specimen is so interesting that it is a pity it cannot be seen by more of those interested in such matters.

The Irrigation Surveys.

Those who have looked forward to speedy results from the inception of surveying for irrigation of arid lands by the Geological Survey will be sorry to learn that the work must stop, temporarily at least, unless the present Congress makes provision at once for its continuation. It seems that there is considerable difference of opinion among the Washington Solons as to what steps the Government should take. Intimation of this has been had from time to time by telegraph, but a better view is given of the situation by Wm. Hammond Hall, who is in charge of the west division reaching from Utah to the Pacific. In an interview with a *Chronicle* reporter, Mr. Hall is represented as making the following statements:

"Work has been practically suspended and will not be resumed until some favorable legislation by Congress. All the work here is being done by one clerk and myself. I have plenty to engage my own time in the engineering problems developed in the surveys of last year. A party of three or four engineers and hydrographers are doing some gaging work on the Carson and Truckee rivers, and similar parties are at work on the Snake, Feton and Fall rivers in Idaho and in Utah and Arizona. That is all that has been done since November. The last appropriation is practically exhausted, and the prospects of the work are in a very muddled state. There seems to be considerable difference of opinion between some of the members of the Arid Lands Committee and Director Powell of the survey as to how the survey should be conducted, and there are also differences of opinion among Senators and Representatives generally. I believe some of the Arid Lands Committee think that Director Powell has been making it too much of a scientific survey in place of a plain, ordinary irrigation survey. Mr. Powell's ultimate policy is set forth in the Reagan bill, which is one of the four or five bills which have been introduced. The opponents of that view generally support Plumb's bill. Some are in favor of turning the survey over to the Agricultural Department; some want the arid lands turned over to the States and Territories, and among the other problems involved are the questions as to whether the Government shall direct the survey and legislate regarding irrigation and water rights, and what that legislation shall be. These differences of opinion regarding the scope, character and ultimate policy of the survey are the reason for the backwardness of the work."

It is unfortunate for this work that this is the case, for twice as much work could be done in the next 90 days as in the 90 days following. The weather would be more favorable, and the next 90 days is the only time of the year to study the flow of streams."

We trust that something will be speedily done by Congress, so that the short season for field-work may not be permitted to pass without progress.

Advantages of Advertising.

The advantages of advertising were never, perhaps, better illustrated than in a recent incident connected with the Pelton Water Wheel Co. of this city. A letter of inquiry from South Africa was not long ago received by this company bearing the indefinite inscription, "Manufacturers of the Pelton Water Wheel, United States of North America," and it came straight through to destination as promptly as though it had borne every particular of the address down to street and number.

The company referred to, having a wheel of extraordinary merit, have availed themselves of the advantages the MINING AND SCIENTIFIC PRESS and other newspapers offer to advise the general public of this fact, as well as of their whereabouts, with the result that even the postoffice clerks know just where to send a misdirected letter. It may also be stated in this connection that the inquiry above referred to resulted in a valuable order as soon as the desired information could be obtained.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR GOLD MINE.—*Ledger*, May 3: There are 12 men working underground. The rock-breaker is being received at the mill; the heaviest piece, said to weigh about four tons, is still at Ione, but an effort will be made in a few days to haul it. The date for starting the mill, owing to unforeseen delays in regard to the track and other matters, is fixed for the 15th of the month.

NEWTON COPPER MINE.—Very little is said about this property, but work is being carried on all the time, sufficient to enable shipments of ore averaging 8 tons per month to be made. They are still working on the large pile of ore on the dumps, and there is enough out to run them a long time yet. Only two men are employed in the process of transforming the ore into copper. Scrap tin is still employed in the sluices instead of iron formerly used, not because it more readily causes the precipitation of the copper, but because it is much easier handled. It can be turned over in the boxes by means of forks, without necessitating contact with the hands, which the heavy iron pieces involved. As much as 25 tons of refuse tin has been received at a time from San Francisco for these works.

MISCELLANEOUS.—The work of changing the concentrators at the New London mill is just completed. A new style of concentrator was tried, and the mill was equipped throughout with the new-fangled thing. They have proved unsatisfactory, and have been cast aside to be replaced with the old reliable Frue. A cave occurred in the shaft of the South Spring Hill mine early this week, involving two sets of timbers. The men were laid off one day. The trouble was not serious, and everything is now in running order again. Taking out the water at the Hardenberg mine at Middle Bar is proceeding slowly. The flow of water is very strong. It is reported that a crushing of 100 tons of rock from the Drytown Consolidated mine will be made at the Cosmopolitan mill. The large casting of the rock-breaker for the Amador mine was brought from Ione on Wednesday by Chichizola's team of 10 animals. It weighed from 6 to 7 tons.

SUTTER CREEK.—*Cor. Ledger*, May 3: The mining outlook is improving steadily. There is talk of adding 20 more stamps to the Wildman. The development of the mine would seem to justify this enlargement of the milling capacity. Sinking at the North Star is progressing satisfactorily; the nature of the ground is such that they are able to make fair headway. The rock that is being extracted from the Lincoln is improving in quality.

Fresno.

QUARTZ AND PLACER.—*Visalia Delta*, May 4: Mr. Rowland intends leaving for his gold mine in Fresno county in a few days. His partner in the mine, James Bridges, is in town this week. The mine is located on Laurel creek, 65 miles from Fresno. It is both a quartz and placer mine. At a cleanup a few days ago, \$285 worth of free gold was taken out. Mr. Rowland is quite sanguine over his prospects. He is satisfied that they can wash out from \$75 to \$30 worth of gold a day now. Snowbanks have to be crossed yet in order to reach the mine.

Inyo.

FISH SPRING HILL.—*Inyo Independent*, May 3: Henry Melone and C. L. Fuller have sunk 50 feet on the ledge recently discovered by them at Fish Spring hill. A crosscut of 25 feet has not reached the hanging wall of the ledge. An old miner who visited the mine lately says the great body of ore in sight will average \$15 per ton in gold. The ore can be worked very cheaply.

GAULAN.—Archie Farrington had men at work some weeks past prospecting the Gaulan mine. The men were stopped from work last Tuesday, as nothing is in sight that would warrant doing more.

CERRO GORDO.—Nothing but prospecting is reported from Cerro Gordo. No ore is being taken out except by a very few tributaries, who are working on claims belonging to the company, and these are not taking out much.

SALINE VALLEY.—W. C. Chapin got back to town last Tuesday from Saline valley. He spent about two weeks over there examining mines. He is well satisfied with several prospects he examined. Mr. Chapin spent some time at the borax works of Conn & Trudo, and is fully satisfied that they have a property of great value.

MINNETTA.—The ore body recently struck in the Minnetta mine, Modoc district, by J. J. Gunn, is reported to be opening up better every day. A miner who came in yesterday was at the mine last Tuesday, and says it is a fine-looking body of ore. Frank Fitzgerald is shipping an average of a carload of ore each week. The ore is reported to net \$200 a ton. In the mine at Lookout, Mr. Fitzgerald is reported to have a fine-looking body of ore in sight. At both these camps more men are wanted; 12 or more good miners would at once be employed, and at least an equal number of men are wanted to work outside.

THE JIGGING PROCESS.—*Inyo Independent*, May 3: The process of jigging low-grade lead-silver ores, though long practiced in other regions, is only beginning to be generally used in Inyo county. An improved machine was delivered at Keeler last Wednesday, for use in the Defiance mine at Darwin. At this mine there is ore enough on the dump and in sight in the mine to supply 30 tons of good jigging ore every day for an entire year. The ore after leaving the machine will average \$120 per ton. After deducting all expenses of mining, jigging, shipping to San Francisco, and working, the ore will leave a net profit of \$60 per ton. Hitherto only the richest of the ores have been taken from Inyo county mines, and these were picked by hand, thus greatly increasing the expense. In ledges 10 or over 20 feet thick, a vein of a few inches of high-grade ore was all that was taken out for shipment; the vast mass that remained was all lost. By the jigging process hand-picking is all done away with; all the ore is taken out and the metal saved. This will make a very great change in our whole system of mining. Many more men will be employed, making much greater demand for all kinds of farm produce, and mines will be worked that under the old wasteful way

would not pay expenses, not to speak of leaving any profit. This improvement will lead to much greater development of mines and so increase the probabilities of finding immense bodies of rich ore, such as that found at Cerro Gordo years ago. Mr. Reddy says he will use all the profits from the jigging process at the Defiance in further development of the mine.

Nevada.

THE NEW FIND IN THE IOAHO.—*Grass Valley Union*, May 2: The new ore body recently opened up on the 17th level of the Idaho mine gives no signs of "petering out," as the drift has been run into it a distance of 30 feet and the ore continues of the same character, being highly sulphureted and prospecting finely in gold. This ore body has strong alternate mineral streaks a foot or more in width, and white quartz, but both the quartz and the mineralized ore contain gold, although the quartz streaks are not as rich as the other in the precious metal. In drifting, the whole of the vein is not being taken out, as it is too wide, but crosscuts will be made as the drift progresses to determine whether the vein holds its present width. Appearances now are that this is a well-defined ore body and not merely a hunch, as was at first supposed.

Placer.

ON THE DIVIOE.—*Placer Herald*, May 2: A. Breece called on us while on his way from Bath to San Francisco last Wednesday. He tells us that the Breece & Wheeler mine is panning out its usual handsome returns. The gravel is running over \$30 to the car, and for the month of April they will declare a dividend of \$10,000, or \$5000 for each of the owners. The Hidden Treasure mine at Sunny South, he tells us, according to his information, is keeping up its old-time reputation for richness. At the Mayflower, he understood, they were running drifts and opening up in good shape.

Shaft.

DRY PROCESS.—*Redding Free Press*, May 3: The working of ores dry, it is thought by some, will soon take the place of wet working. The new reduction works now being built at Redding are for dry working entirely. The Calumet Co. will start its new dry-working mill on Monday, the 5th of May. This mill is for working ores by the Paul dry amalgamating process, which gave such large results over wet battery work last year.

Sierra.

RED OAK.—*Mountain Messenger*, May 2: Jo Lavezzola, in accordance with instructions by telegraph from Carson, Nevada, has put on a new force of men at the Red Oak drift mine.

Trinity.

JUNCTION CITY.—*Cor. Trinity Journal*, May 4: Most of the mines are and have been running steadily throughout the winter, except the Red Hill gold mine, which receives its supply of water from Canyon creek, the delay being caused by the heavy fall of snow at the head of the ditch and numerous breaks and slides. Although the work of repairing the damage has been going on for the last two months, the water was not turned on till within the past week. Good work can yet be done in the mine, as the season will be much longer than usual. All the mines are doing well with the expectations of more than the average amount of bullion at the final roundup.

LARGE ENTERPRISE.—*Journal*, May 3: Supt. O. P. Powers of the Lower Trinity Tunnel Co. informs us that everything is progressing satisfactorily in his vicinity. He has 30 men getting out timber, cutting lumber, building flume, cleaning out ditch, etc. Mr. Powers says that he will have the water on the Taylor Flat hydraulic mine by the middle of July, and will then have sufficient water to run the claim till the fall rains. As soon as the water is brought on the claim he will commence sluicing; he will open the mine at the lower end of the flat, and in the opinion of the mining men acquainted with the ground, will develop a good property. Mr. Powers says that he thinks the amount of water in the river will hardly admit of working the river-bed this season, if it can be worked at all; it will be late before the tunnel will be able to carry the water of the river. Last year, which was an exceptionally dry season, the tunnel did not carry the waters of the river till the middle of July. However, the company will not lose any time, as it can operate extensively on the Taylor Flat mine this summer. It is possible that work can be done on the river-bed by September; elevators will be used to work the bed.

Tulare.

CORONADO.—*Visalia Delta*, May 4: The Coronado mine near Clough's cave is booming; galena and a high grade of ore has been struck at a depth of 12 feet. The proprietors, J. C. Swickard, M. P. Leshner and Joe McKimmie, are sinking a shaft by the river-side. The mine is incorporated. M. P. Leshner of Tulare is president, E. M. Jeffers of Visalia secretary, I. T. Bell treasurer, and J. C. Swickard superintendent. Considerable stock is being sold to develop the mine.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Enterprise*, May 3: The southwest drift on the 630 level is still in a porphyry formation. This porphyry carries some water.

UNION CON.—East crosscut No. 1 on the 1465 level is being advanced in porphyry, after having (last week) passed through a seam of clay about one foot in width.

MEXICAN.—West crosscut No. 4 on the 1465 level is in vein porphyry that carries some small seams of quartz.

UTAH.—The west drift on the 725 level is making fair progress without change of material worthy of note.

CON. CALIFORNIA & VIRGINIA.—The 1300, 1500 and 1600 levels continue to yield the usual quantity of ore. On the 1435 level west crosscut No. 3 from the main west drift still continues in porphyry and quartz of a promising appearance. On the 1600 level some good ore is being found in the old stopes. Ore of fair quality is being extracted from the 1650 level at several points. The usual amount of ore is being shipped to river mills, and the average assay will be about the same as last week.

OCCEIDENTAL CON.—The stopes on the 400 and 450 levels are still yielding ore of a good quality.

A good deal of prospecting is being done and milling ore has been found at several points.

OPHIR.—Some ore of good quality is still being found on the 1300 level. A considerable amount of prospecting is being done.

CON. IMPERIAL.—West crosscut No. 3 from the 300-foot level north drift (Yellow Jacket level), which is the 750 level of the Imperial, is out 48 feet, having been commenced during the week. The face shows quartz and porphyry. The joint Confidence, Challenge and Imperial north lateral drift on the 800-foot level is in 138 feet from the north line of the South Challenge, 43 feet having been added during the week. The face is in porphyry.

CHALLENGE CON.—The prospecting work joint with the Confidence is progressing well. The drifts and upraises are in promising ground at several points, it being a mixture of quartz, clay and porphyry.

CROWN POINT.—The raise from the 400 level is passing into quartz that carries metal. The west crosscut on the 300 level is still in favorable ground. Are shipping to the mill nearly 900 tons of ore a week, the average of which is, by battery samples, nearly \$19 a ton.

GOULO & CURRY.—On the 400 level at a point in west crosscut No. 1, 587 feet from main south drift, northwest drift was started and advanced 18 feet. Formation, hard porphyry.

KENTUCK.—The 900 level is looking well, and the winze below the 950 level continues to show good milling ore.

OVERMAN.—The incline winze on the 1200 level continues in ore of a good quality. The ore breasts on the 1200 level are looking well and regular shipments are being made to the Vivian mill. The ore runs high in gold.

HALE & NORCROSS.—Ore is being extracted from the 400 and 1300 levels and sent to the Nevada mill. A good deal of prospecting is being done on the 500, 750 and 1200 levels. The average of the battery assays is \$17.54 a ton.

BELCHER.—The southwest drift on the 200 level is being advanced in quartz of a low grade mixed with seams of clay. The drifts on the 300 and 850 levels still continue in porphyry and clay.

JUSTICE.—On the 62d level, raise No. 1 is up 75 feet and shows low-grade quartz. Shipped to the mill during the week 199 tons and 860 pounds of ore, the average battery assay of which was \$27.97 per ton.

SEG. BELCHER.—On the 1000 level the south-east drift is still in low-grade quartz.

ALTA.—The ore-producing sections are looking well. The mill works an average of 45 tons a day and the ore pays about \$20 a ton.

YELLOW JACKET.—The usual shipments are being made to the Brunswick mill. The ore averages about \$20 a ton.

CHOLLAR.—On the 750 level the south drift is still in ore that averages about \$30 a ton. The prospecting drifts on other levels are without change, being still either in porphyry or porphyry and quartz. Are extracting nearly 500 tons of ore a week.

POTOSI.—The winze below the 900 level shows quartz that yields good assays. The raise above this level has passed through the quartz and entered the porphyry. On the 850 level all is about the same as last week.

ALPHA.—South lateral drift, 600 level, is out south of shaft 53 feet; face in porphyry. The east crosscut opposite the shaft, 600 level, is out 36 feet; face in porphyry.

SILVER HILL.—All prospecting operations going on as usual without change of formation.

JULIA CON.—Work is going on in the north-west drift, 800 level, as usual.

WARO COMBINATION SHAFT.—The east drift from the shaft, 1800 level, is out 353 feet; face in porphyry.

NEW YORK.—On the 650 level the west drift is in material that carries some metal. On the 850 level the north drift is in a mixture of clay and quartz. On the 950 level the south lateral drift is still showing quartz that gives low assays.

SCORPION.—On the 630 level the southwest drift from the shaft is now advanced 328 feet, continuing in a porphyry formation.

ANDES.—Past week extended north drift on 420 level 107 feet. Formation, clay and porphyry with seams of quartz. Repairing and cleaning 175 level. Main drift progressing favorably.

SAVAGE.—Are extracting ore from the 400, 500, 600 and 750 levels, and are running prospecting drifts on each of these levels. The north drift on the 334 level continues in porphyry. Are milling about 450 tons of ore a week. The average of the ore is \$23 a ton.

BEST & BELCHER.—On the 1000 level, east crosscut No. 1 has been extended 9 feet; total length, 367 feet. Formation, hard porphyry. The joint west crosscut on the south line has been cleaned out and repaired 40 feet. On the 1200 level the north drift has been cleaned out and repaired 22 feet; total distance, 645 feet.

Cherry Creek District.

EXCHEQUER.—*White Pine News*, May 3: Mose Scramlin is in from Cherry Creek. He informs us that the Exchequer lessees have developed a body of ore in that mine and that their prospects for making some money are good. They have increased the force at the mine and are now working 12 or 13 men. They expect to start up the Ti-cup mill in a few days.

Comet District.

GOLD.—*Pioche Record*, April 25: A fine vein of gold ore has recently been discovered in Comet district, which assayed \$36 per ton. Heretofore assays have not been made for gold either in this district or Irish mountain, though indications point to such deposits.

Ely District.

QUET.—*White Pine News*, April 29: Mining matters in this district remain in statu quo. That is, we have nothing new to report in the way of development or sales. The Rob Roy, which was reported sold for \$40,000 in our last, turns out to be true only in part. Only a third interest in the property changed hands, and it is said the proceeds of that interest will be applied to putting up a mill.

Eureka District.

THE DIAMOND.—*Eureka Sentinel*, May 3: Messrs. R. MacIntosh and R. C. Chambers, of Salt Lake, have spent the greater part of the week here inspecting the Diamond mine which they purchased

last fall. The work of development has progressed favorably during the winter, under the direction of Supt. Chas. Read and Foreman Maurice Hartnett, and the owners now feel justified in undertaking deeper explorations. Accordingly a tunnel has been started at the base of the mountain which will render possible the prospecting of a vast vertical section. The length of the tunnel at a point under the apex of the mountain will be approximately 1700 feet. Ground was broken on this important work during the week. Machinery is to be erected and Burleigh drills driven by compressed air are to be used. It is believed that the main tunnel can be completed in four months after the machinery shall be in readiness. It is not to be a mere straight hole into the mountain, but the ground is to be crosscut in all directions. We regard this as the first thorough test to determine the real value of Prospect mountain. In this view the work becomes one of the most important ever inaugurated here. If great ore bodies should be developed in the heart of the mountain, as we believe there will be, a new lease of life will be given to Eureka District, and the old prosperous days of the past may again revisit us. The inauguration of this new work will afford employment for an increased number of men during the summer.

A DEVELOPMENT IN THE EUREKA CON.—The *Sentinel* learns of a development of a new ore body in the Eureka Con. Mine. It is located in the ground formerly belonging to the K. K. Company. The size of the new find is said to be about nine feet in thickness, so far as known, with evidences of still further improvement. There is plenty of virgin ground in the vicinity to contain a good-sized bonanza. It would be a great thing for the camp if some of the old-time ore bodies could be unearthed in the Eureka Con. There were acres of ore on some of the levels of that mine.

ORE AND LEAD.—The ore shipments to Salt Lake this week have amounted to 51 E. & P. carloads. There was also considerable ore shipped by the Ruby Mining Company from the Dunderberg mine to the Eureka Con. furnaces. The E. & P. Railroad Co. pulled out seven carloads of Eureka Con. lead (old stock) during the week.

Pahrnatagat District.

SILVER.—*Pioche Record*, April 25: Tom McDonald came up from Pahrnatagat last Friday with a batch of ore from his Fantasmagoria mine, which pulped 525 ounces in silver per ton. A few more such shipments will cause a stampede to Irish mountain.

Pioche District.

THE LOST LEOGE FOUND.—*Pioche Record*, April 25: It is rumored on the streets that Supt. Sam Godhe of the Pioche Consolidated and Yuba Cos., has discovered the long-lost Raymond & Ely ledge between the 9th and 10th levels. The ledge was discovered through a fissure leading into the foot wall and extends as far as prospecting into the old Meadow Valley ground. The vein is five feet in width, and assays up in the hundreds. The ore is free milling.

Seligman District.

SLUICING.—*White Pine News*, May 3: The Robinson Canyon Con. Co. have been busy for the past four or five days and nights sluicing gravel from Shaft No. 2, with a good headway of water. They are in high anticipation over the outcome.

Tybo District.

THE DIMICK.—*Eureka Sentinel*, May 3: Mr. Leet of San Francisco returned during the week from Tybo. His business was to inspect the Dimick mine in the interest of parties desiring to purchase a good mining property. It is understood that he found the mine to be even better than had been claimed for it. There is no doubt that he will make a strong favorable report on the property which will most probably lead up to its early sale. The great beauty of the Dimick mine is that there is no risk about it. It is a true fissure vein of great ascertained and prospective value. It is on the same ledge with and is the westerly extension of the celebrated Two G mine, which yielded over four millions above the 400-foot level. The Dimick mine has a better future than its neighbor. The location is more favorable and the ore of higher grade. It will be a good thing for the southern country when this magnificent mine shall pass into the hands of a strong company. Tybo is likely to be a busy camp again before the season is past.

ARIZONA.

GRANVILLE.—*Clifton Clarion*, April 26: W. F. Hagan of Granville camp is working six men, driving a tunnel to cut the 100-foot shaft. Granville is a silver camp, and a good one, too. Mr. G. M. Forbes has bought some property in this camp and bonded 11 claims.

ACTIVITY IN MOHAVE CO.—*Cor. Kingman Miner*, May 3: For several years past three large teams, one a 14-mule with three wagons, and two 10-mule teams of two wagons each, together with several two and four-horse teams, were able to handle the ore and freight of Mohave county. During the past winter there were two months lost time on account of heavy rains and bad roads, so that ore and freight accumulated, but miners generally were confident that there would be an advance in the price of silver. As the weather got settled and the roads got good, men owning teams began to increase their capacity. At present there are six instead of three large teams at work besides several small teams, and there is much complaint among miners that they cannot get their ore hauled. The advance of silver will soon wake up the old camps. A ready rumor has it that the McCracken and Feabody will again start up. These mills (one a 15 and the other a 20-stamp) will again be repaired. They have only laid off on account of the low price of silver. These mines contain mountains of ore of fair grade. It is rumored that a water-power will be improved on Burro or Sandy creeks and an electric plant will be put up, thus saving the high price of wood. Aside from these mines, the O. K. and the Music Mountain M. Co.'s properties, the Flores and Oro Plata, between this place and Mineral Park, are putting up large hoisting works and it is expected that they will put up large mills. At the present time all the miners that are at work are doing remarkably well. Owners of silver mines are in high spirits and they all have a smile on their countenances, and well they may have, for the advance in silver makes low-grade ore pay and high-grade ore in proportion. It is more than probable that

within six months from this date there will be three times the amount of labor employed in Mohave Co. that has ever been since the location of the mines, 25 years ago.

HYDRAULIC.—Prescott *Journal-Miner*, May 3: The Lynx creek hydraulic works were closed down fast Friday on account of failure of water. They had a very good run during the season, washing out several thousand dollars in gold. Messrs. Chambers & Charmick of Lynx creek expect to start up the Low-ell mill soon again. They are only awaiting oow the arrival of parts of the machinery from San Francisco. Operations were commenced in the Ryland mine again last week. The mill is also being put in shape to start up soon. The camp promises to become even more lively than it was before. Supt. Kiley of the Ryland mine has returned from his trip East and has gone out to the mine. Officers of the company are expected soon, and it is said that they contemplate making some very extensive improvements to the mill, probably doubling its present capacity.

GOLD.—Prescott *Courier*, May 5: Judge Richard DeKuhn, superintendent of the Mocking Bird mill and mine, deposited some 35 ounces of gold at the Bank of Arizona Saturday last. He is rustling animals to pack ore to the mill. Mr. Gillespie, of Congress City, was here Saturday last and stated that the mine is in a very healthy condition. Teams are almost every day bringing in sulphurets. Senator people are not given to praise of the mine, but it is leaked out that the recent strike is rich and big. It was found 300 feet below the grass roots. Supt. Kiley has a large force on the Ryland. Forty stamps will soon be crushing ore. Bradshaw district's three mills, the Crown King, O. B. La and Del Pasco, are hard at work. Clean-ups good. Tip Top district miners are taking out and shipping about \$15,000 worth of silver ore each month. Lowell mill, Walker district, is idle, lessees awaiting the arrival of some machinery from San Francisco. J. W. O'Bryan is taking good ore out of some of Old Grizzly's mines, in Walnut Grove district. Old Grizzly himself hopes to return, soon, prepared to open other mines. fllside mine is yielding more first-class ore than can be hauled to the railroad. The rise in the price of silver is having a good effect in our Territory.

BRITISH COLUMBIA.

GOLD AND SILVER.—Kamloops *Sentinel*, May 3: Recent investigation shows that there is in Kere-meos and Simalkameen gold quartz, assaying from \$24 to \$174 per ton. Rock Creek also has gold quartz, assaying from \$35 to \$300 per ton. Mr. G. Douglas has been working one of the principal mines for a New York Co. for the last four years, and is now in the East to bring out milling machinery for the purpose of reducing the ore, of which there is a great amount already on the dump for milling and plenty in the mine. W. A. Jowett, of Revelstoke, has just returned from England, whither he went in connection with some mining property in the vicinity. In Winnipeg, to a reporter, he said that as the richness of the British Columbia mines becomes known, less difficulty is found in London in obtaining capital, and already English syndicates have bonded a number of mines. Mr. Jowett has great confidence in the mining future of British Columbia. The silver-ore ledge recently discovered at Bowen Island is now found to be from five to seven feet wide, running in a northeasterly direction and standing nearly perpendicular. It crosses the island in an oblique course from shore to shore. The foot-wall is granite and the hanging-wall is shale, so that it can be easily traced on the line of contact between the two. The rugged ridge facing Bowen Island on the mainland will surely reward the prospector, for there is and must be copper ore.

COLORADO.

THE JUSTICE.—Aspen *Times*, May 3: It appears that the Justice is still under partial restraint. The company's attorney agreed not to work more than six men on ore until May 15th. It is altogether possible that, after that date, the company will be entirely free.

TO BE LISTED.—The stock of the Park Consolidated Mining Co., which owns the Buckhorn, Castle No. 2 and Tanner claims, will probably be listed on the Denver Exchange.

THE LITTLE RULE.—Reports from the Little Rule are very encouraging. The ore that is being taken from the new discovery attracts attention wherever samples of it are shown. If the streak holds out, as it now promises to, it will soon bring the mine into great prominence.

DAKOTA.

SYNDICATE SMELTER.—Deadwood *Pioneer*, May 3: Nate Wilcox has been at work at the smelter for some 15 days past. Foundations for the two engines and boiler, new ore bins, new crusher, platform scales for ore-wagons, coke-houses, etc., are all ready, and yesterday Dr. Carpenter received a telegram announcing that the long-delayed machinery had at last been found and started on from Chicago. It is very annoying, as his agreement called for complete works, running full capacity by the 10th of May. The time will now, necessarily, be extended.

IDAHO.

THE SEVEN DEVILS MINES.—Boise *Statesman*, May 4: The prospects for Weiser and Washington county are exceedingly bright this summer. Mr. Kleinschmidt and a party of Montana gentlemen passed through Weiser recently en route for the Seven Devils mines. They informed our correspondent that 20 teams are now on the way from Montana, that have contracted to haul 20,000 tons of ore from the mines to the new steamboat on Snake river. Experts say that \$1,200,000 will be realized from the Peacock mine this summer, leaving 55,000 tons of ore still in sight. This is Lui Allen's old mine, and is doubtless the richest copper mine in the world. It is estimated that from 10,000 to 15,000 people will go to the mines of the Seven Devils district this year. Prospectors are daily going in that direction from Weiser.

THE BANNER MINES.—Henry Hammond, who

has charge of a sawmill in Banner Mining district, owned by the Elmira Silver M. Co. of N. Y., said that the little mill would have to be moved about three miles this spring for the reason that the country around where it now stands had been almost entirely denuded of timber. After its removal it will be one and a half miles from the mines. The Banner mine is not being worked. It was rich enough, but the machinery on the ground was not powerful enough to keep the water out below the 500-foot level. As soon as John Brown, the superintendent, returns from the East, it is expected he will have 100 feet lower sunk on the lode. The Wolverine and Crown Point are adjoining lodes, nr, perhaps more properly described as claims upon the same lode. They are both worked from one shaft and that is sunk on the Wolverine; 1100 tons of good, rich ore that will average \$100 to the ton is now lying on the dump. About 20 men are now at work in this shaft, and some ore being added to the already large pile, though the men are generally engaged in deadwork. It is intended to sink this shaft another hundred feet this season.

MONTANA.

THE SILVER BOW HYDRAULIC.—Butte *Miner*, May 3: Work on the Silver Bow Hydraulic Company's property, which consists of 2500 acres of placer ground located between Rucker and Silver Bow, will be commenced on or about the middle of the month. This is one of the greatest placer-mining enterprises ever inaugurated in Montana, and will undoubtedly yield many thousands of dollars to the projectors, as the ground will be worked on an extensive scale. The new ditch, which is calculated to carry 800 inches of water from Freely's station to the top of Rucker Hill, a distance of 20 miles, is now almost completed by Mr. Winters, the contractor.

NEW MEXICO.

DIVIDEND.—Silver City *Enterprise*, May 2: W. C. Hadley, superintendent of the Lake Valley mines, informs an *Enterprise* man that his company paid a dividend of 5 cents per share, \$25,000, in April, and had enough stuff on hand to declare another dividend. Tom Knott called at this office last Tuesday and reported a strike of rich gold ore recently made by him in the Burro mountains. The money was paid yesterday on the zinc mines mentioned in our last week's issue, about \$25,000 in all. J. W. Fredericks, who is now operating at Stein's Pass, states that there is more activity at the Pass than for some years past. Mr. Bowman of Colorado has recently acquired some valuable zinc properties there, and is preparing to ship the ore in large quantities. The *Enterprise* reporter was shown a pretty little gold retort of 10 ounces by Idus L. Fielder. The gold was the mill return from eight tons of ore taken from the Esperanza mine by leasers to whom the Mammoth company has let the mine on tribute. The Pacific company has started hauling ore and will start five stamps of their mill to-day or to-morrow. The other 15 stamps will be started as soon as the vanners for the concentration of the tailings from them are in readiness to work. Four vanners are now in place and four more will be added, when the mill will be run to its full capacity. There is an abundance of ore of good grade in sight. James Sullivan and Jerry Clarke are working the Never Fail mining claim in Gold Hill district with very satisfactory results. A good streak of ore has been exposed to all the workings. A carload of ore taken from a slope in the drift, and now on the dump ready for shipment, carries 35 per cent lead, 8 ounces gold and 13 ounces silver per ton.

OREGON.

BLUE RIVER MINES.—Cor. *Oregonian*, May 2: There was a company organized in Brownsville last night which deserves more than passing notice. For several years past there has been some prospecting for precious metals on the head-waters of the Calipooia and Blue rivers, but no very great amount of money or labor has ever been spent, and yet very flatter ing prospects have been found and now an effort is going to be made in a somewhat different way. Twenty of the leading claims in these districts have been consolidated, and papers have been made out incorporating them all into one company, to be known as the Calipooia and Blue River M. & M. Co. The following are the elected directors for the coming year: N. B. Standish, C. H. Elswick, J. J. White, W. B. Blanchard, and W. W. Robe; George A. Dyson secretary, and C. H. Cable treasurer. As soon as the weather and roads become settled, a force of men will at once be sent to the coal mines and work commenced in earnest.

UTAH.

A REVIVAL OF INTEREST.—Salt Lake *Tribune*, May 2: There is a revival of interest in mining which bodes good to this country. The old camps are being looked over by both old citizens and strangers in search of good properties. The rise in silver and lead, and the belief that mining is going to pay better in the future than in the past, is what has lately stirred up this interest. A big Colorado syndicate has a man in the field who has just looked over Dry Canyon, Ophir and Stockton, and believing that a railway west is one of the early probabilities, he has gone to Dugway, Deep Creek and other localities which are destined to become big contributors to this market. The warm days of the past week have started out many of our old prospectors to follow up the snow line as it climbs up the hills. Reports from the mines assert that there are large blocks of stoptog ground exposed in them, and there is good promise of a lively season and big output from nearly all the mines being operated in Utah. The four months of this year have yielded in bullion (excluding all ore exports), \$1,018,833.08. The receipts of the metals in this city for the week ending the 30th, inclusive, were to the total value of \$153,480.92, of which \$87,289.92 was in ore and \$65,191 was in bullion. For the previous week the receipts were \$73,585.74 in bullion and \$25,998.92 in ore, a total of \$99,584.66. The product of the Ontario for the week was of bullion, 17,436.06 fine ounces. Bullion receipts in this city for the week were to the value of \$26,305; base bullion, \$9900; Ontario bullion, \$17,436. The Hanauer smelter produced during the week bullion valued at \$13,225.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Daway & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING APRIL 29, 1890.

- 427,029.—FAUCET FILTER—Frank Bardez, S. F.
426,767.—MITER BOX—J. E. Bundy, San Rafael, Cal.
426,920.—HORSE-CLIPPING MACHINE—E. A. Cochran, Pasadena, Cal.
426,664.—WATERING-CART—P. B. Donahoo, Fresno, Cal.
426,718.—PURIFYING WATER FOR BOILERS—Chas. Elliot, S. F.
426,667.—MEASURING FUNNEL—W. H. Grissim, Santa Rosa, Cal.
426,726.—SHAFT FOR VEHICLES—W. Holloway, Gilroy, Cal.
426,502.—CALIPER—T. Isaac, Sacramento, Cal.
426,939.—SAFETY PLUG FOR WASH-BASINS—D. F. Jones, S. F.
426,592.—VENT-STOPPER FOR ORDNANCE—Jas. Kelly, San Diego, Cal.
426,593.—DEVICE FOR LAYING GUNS AT ANY ANGLE—Jas. Kelly, San Diego, Cal.
426,603.—HOP-PICKER—Peterson & Clark, Santa Rosa, Cal.
426,681.—DREDGER—W. R. Pless, San Joaquin, Cal.
426,683.—LUNG-TESTING TOY—S. H. Pratt, Strawberry Valley, Cal.
426,739.—DISH-WASHING MACHINE—T. A. & H. W. Pudan, Sacramento, Cal.
426,478.—FRUIT-DRIER—G. W. Thurston, S. F.
426,885.—ELEVATED CABLE ROAD—W. P. Wallig, Santa Monica, Cal.
426,886.—SELF-OILING CAR AXLE—A. A. Weber, Sacramento, Cal.
426,804.—COMBINED AX, HAMMER AND MAUL—C. H. Williams, Prineville, Oregon.

The following brief list by telegraph, for May 6, will appear more complete on receipt of mail advices:

- California—Calvin Brown, San Francisco, apparatus for submarine exploration; Preston G. Gestford, Jr., Napa, adjustable bed bottom and brace; Jacob Harps, S. F., band truck; Samuel F. F. Mobill, assignor of one-half to J. R. Fritz, S. F., street-sweeping machine; Ellsworth D. Middlekutt, Stockton, automatic cork-puller; Henry D. Beaves, Monticito, fruit-gatherer; William H. Shannon, Stockton, assignor of one-half to J. H. Crystal, Corra, carburetor; Ektor R. Shaw, S. F., assignor to Mosher, Shaw & Craig, San Jose, drier; John C. H. Stot, S. F., telephone; John C. H. Stot, S. F., cable-tightener for cable railways. Oregon—Andrew M. Roberts, Mitchell, tool for trimming horses' hoofs; Daniel Siddall, The Dalles, dental elevator; William T. Sterling, Enterprise, harrow.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SACK-HOLDER.—Alexander McDonald, Franklin, Sacramento Co., Cal. No. 426,208. Dated April 22, 1890. This invention relates to that class of implements which are designed to hold a sack with its mouth or opening properly spread under a discharge spout, whereby grain and other material are delivered to it. The invention consists in a frame having arms by which it is secured to the chute or spout, said frame having in one side fixed teeth or tines for engaging one side of the sack, and in its other side a rock-shaft provided with teeth for engaging the other side of the sack, said shaft having a lever by which it is rocked, whereby the teeth are caused to stretch and hold the sack, and in a means connected with said rock-shaft for operating automatically the on-off gate or valve of the chute or spout.

WATERING-CART.—Peter B. Donahoo, Fresno. No. 426,664. Dated April 29, 1890. The invention consists of one or more axially rotating water vessels or receptacles traveling on the ground and provided with draft connections by which they are drawn, said vessels or receptacles having interior diaphragms or partitions dividing them into compartments. Through these vessels or receptacles passes a pipe having openings in its top, and having connected with its center a perforated discharge pipe and an inlet pipe. The object of the invention is to provide for a great increase in the capacity of the watering-cart at the same time that its draft is reduced, these objects being attained by avoiding the ordinary wheeled frame upon which the water-tank is carried, and employing in its stead one or more axially rotating vessels which serve as their own wheels.

HOP-PICKER.—Raford W. Peterson and Samuel B. Clark, Santa Rosa. No. 426,603. Dated April 29, 1890. This is a machine for picking and separating hops from the vines. It consists essentially of sets of belts traveling parallel to each other, having transverse slats between which the vines are held, and cylinders or beaters rotating so as to pull the hops from the vines and drop them upon a carrying belt below; means for separating the hops from the leaves and for transporting them to a proper receptacle.

LUNG-TESTING TOY.—Samuel H. Pratt, Strawberry Valley, Yuba Co. No. 426,683. Dated April 29, 1890. This is one of that class of toys which are adapted to afford amusement by determining the power of the lungs of one who has knowledge of its operation, but wholly failing of result when in the hands of one who

may be ignorant of its construction, the object being to create temporary surprise at the failure and thus enhance its interest. The invention consists in a box or case having a wind-wheel within it and a registering dial on its exterior with hands for registering the revolutions of the wheel; an axially movable blow-tube let into the box or case and normally communicating with the wind-wheel, a concealed exhanst-port in said tube, normally closed, but adapted to be opened unperceptibly when the toy is handed to a person having no knowledge of it, and an exhanst compartment in the box or case into which the exhanst-port opens, whereby the air blown into the tube is misdirected.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

*Collecting assessment.
†Mine expenses not included.
‡Mine expenses and full bullion return not included.
\$Collecting assessment, April bullion to come in and mine expenses to come out.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

LA ESTRELLA & MINERVA M. CO., April 21. Location, Rosario, Mexico. Capital stock, \$10,000.00. Directors—A. S. Barney, A. H. and Thos. F. Fish, David Hunter and H. B. Havens.

CALIFORNIA ELECTRIC TRANSIT CO., April 22. Capital stock, \$1,000,000. Directors—M. Livingston, A. Lefont, G. M. Asbe, Otto Belau and John M. Patterson.

HATHAWAY G. M. CO., April 26. Capital stock, \$400,000. Directors—T. B. Valentine, S. D. Valentine, J. S. Finch, C. H. Lindley and J. B. Hughes.

PEOPLE'S HOME SAVINGS BANK, April 26. (Amended articles.) Capital stock, \$1,000,000. Directors—F. A. Waterhouse, Isaac Upham, J. K. Wilson, Geo. Tait and Geo. D. Fry.

WEST COAST DEVELOPMENT CO., April 26. Object, bandling real and personal property, both as principals and brokers. Capital stock, \$100,000. Directors—M. K. Zanden, Arthur Bull, W. W. Hollister, Chas. Montgomery and Chas. G. Clinch.

LINCOLN M. AND MANUFACTURING CO., April 29. Object, to mine for coal, fire clay and glass-sand in Placer county. Capital stock, \$1,000,000. Directors—A. J. Angell, O. Arnold, A. H. Gales, A. Barron and J. R. Kelly.

AUSTIN.—The Virginia *Enterprise* says there are now employed in Austin but twelve men on day's pay, and there are not many more employed as tributers. A Chicago company has a bond on the principal mines of the district, which will fall due in July, when it is hoped they will pay up and resume operations. The resumption of mining operations in Austin means the expenditure of a considerable outlay of money, but the conditions would seem to justify it. The mines have been worked to the water level, and they have paid their way and handsome dividends over and above the cost of operations. It is therefore most reasonable to presume that with much better means for the handling, extraction and reduction of ores, and cheaper material, they can be made to pay below the water level, over and above the expense of pumping the water.

MECHANICAL PROGRESS.

The Difference Between Siemens-Martin Steel and Siemens Steel.

It is a common mistake, even among those who should be familiar with such matters, to confound Siemens-Martin steel with Siemens steel pure and simple. The two steels are manufactured by essentially different processes, the former by the Martin process in a Siemens regenerative furnace, hence the compound name, and the latter by the Siemens process proper.

Mr. F. J. K. Canella, a steel works manager of Wales, makes the following clear distinction: "In the earlier or Siemens-Martin process, malleable iron, wrought scrap, or scrap steel is melted in a bath of pig iron, from which the impurities are eliminated solely by the action of the flame and the addition of spiegel or ferromanganese. Wrought metal or scrap is an essential element of the process, and no ore is used. In the Siemens process, on the other hand, a much larger relative quantity of pig iron is employed, and although scrap is also generally worked up, the process can very well go on without it. Then, again, the impurities are driven out from the pig iron by the addition to the bath of a properly-selected iron ore, which becomes reduced while its oxygen carries away the carbon and assists in the formation of a silicious slag. Both processes require Mushet's addition of ferro-manganese at the end, a common need for most steel-making processes. It will require very little further explanation to show that the Siemens process lends itself more readily than the Siemens-Martin to the production of large quantities of a high-class material of uniform nature, as pig iron and iron ore of the necessary quality are always available in any required amounts, whereas wrought iron scrap and scrap steel are very difficult to procure in quantity and of the requisite quality."

THE FUSING POINT OF BLAST FURNACE SLAGS.—The Journal of the Society of Chemical Industry says that the results of some experiments on the fusing points of blast furnace slags recently made by P. Gredt, of Germany, are of much importance for both the iron and pottery industries. For the economical working of a blast furnace, the melting point of the slags which are formed is of consequence, as these ought to melt in the furnace at the same temperature as the iron. If they melt at a lower temperature they will combine with some of the iron, and if at a higher temperature a waste of fuel takes place. The formation of a suitable slag must therefore be carefully regulated by the addition of various gangues and fluxes in definite proportions. The slags obtained from a blast furnace in good working order consist almost entirely of silica, alumina, lime and magnesia, together with small quantities of alkalis and iron. The author obtained the requisite materials as pure as possible, and made them up with pure dextrin into tetrahedra resembling Seger's cones. Two series of slags were prepared in this manner: In Series I the amount of silica was kept constant and the proportions of lime and alumina varied from no lime to no alumina, while in Series II the cone with the lowest melting point in Series I—No. 11—was taken as the basis, and the lime in it gradually replaced by magnesia. In this manner the temperature of formation of slags containing silica, lime, magnesia, and alumina in every proportion was ascertained. From such experimental data a slag can be compounded to melt at any desired temperature.

MALLEABLE BRONZE.—A patent has been taken out, both in England and France, says the Boston Journal of Commerce, by A. Sauter, C. Marechal and A. Sauter, establishing a process for producing malleable and ductile bronze bars or plates, which are free from cracks and blowholes, are "inoxidizable," and which may be "rolled and drawn with the greatest ease." Moreover, the metal has the appearance and "sonorosity of gold." One and a half kilos of tin are purified by melting under niter. Ten kilos of copper are melted, and 50 grammes of equal parts of nitrate and cyanide of potassium are added, for the double purpose of reducing the oxide and "fattening" the metal. Then 25 grammes of bitartrate of potassium, with the same quantity of cyanide, are added, and after pelling, the tin is introduced; 25 grammes each of sal-ammoniac and cyanide are thrown on, one gramme of "phosphuret of copper" introduced to "impart mildness," and 20 grammes of "Marseilles soap" added, which still further "fattens" the metal. Finally, one gramme of sodium is added at the moment of casting.

WOVEN WIRE BELTS.—Machine belts made of woven steel wire are now being manufactured. Belts so made can be readily lengthened or shortened, and the joint cannot be distinguished from the rest of the belt. They are very strong, run very smoothly, and are claimed to be specially adapted for driving fast-running machinery.

A NEW MECHANICAL INSTRUMENT has been devised by a French inventor, which is said to indicate with marvelous accuracy the exact spot where interior flaws in iron and steel are concealed, the proof being obtained by fracturing the rails to see whether the invention had really discovered the presence of defects not outwardly visible. Very satisfactory experi-

ments were recently made with the instrument at the Erment Works of the French Northern Railway. This instrument will be of special value in testing the soundness of rails for railroad tracks, for the reason that a large proportion of railroad accidents occur from rails which break from such hidden causes as it is claimed this device will detect. The instrument is both mechanical and electrical in character.

THE MEASUREMENT OF DRAWN WIRES.—The determination of the thickness of metal in all forms is so delicate an operation that it is no wonder there are constant disputes over the gauges. Interest must therefore be attached to the new apparatus for measurement which Mr. W. H. Johnson exhibited at the last meeting of the Manchester, Eng., Philosophical Society. The inventor said it could measure thicknesses from 1-10,000 inch to three-fourths inch. In the paper which Mr. Johnson read he pointed out that workers in metal must from a very early time have required much more accurate means of measurement than other artisans. Wire-drawing is a very old industry, and it is remarkable that in Africa Livingstone saw wire drawn by a method the same in principle as the most modern methods, with the exception that machinery is used in the latter. Mr. Johnson said his new gauge is an adaptation of the micrometer screw, which for certain practical purposes he considered handier than Sir Joseph Whitworth's. —*English paper.*

NEW INVENTION IN GLASS INDUSTRY.—An invention has been perfected in the glass industry which, it is stated, will accomplish a complete revolution in that branch of manufacture. Until the present it has only been possible to produce sheet glass by blowing a hollow cylinder, which was then cut off, separated and polished. An American manufacturer has now succeeded in producing glass plates of great breadth and of any desired length, by means of rolling. Glass thus produced is said to possess a far greater homogeneity, firmness and transparency, and it has, on the upper surface, a brilliancy which is hardly to be distinguished from art plate glass. The material part of the invention consists in the application of the peculiar, undulated, hollow metal rollers, heated from the inside by means of steam or gas. The rollers seize the sticky, liquid glass which is conducted to them from the bottom of a melting-tub, without the intervention of any other apparatus whatever.

SEWING MACHINES IN GERMANY.—The Germans are making special exertions to extend the market for their iron and machinery products in the trade centers of the world. They are now sending some 200,000 sewing machines annually to South America. One of the largest German manufacturers of these machines which turns out about 30,000 a year, purposes to establish a large warehouse in Chicago, when he expects to undersell American machines, looking chiefly for customers among his countrymen who have settled in this country. The tariff men in Congress should see to it that our own mechanics are properly protected in this direction.

IMPROVEMENTS IN SOLDERING.—A soldering apparatus recently patented is made with metal discs for holding the work, and heating burners attached. A treadle apparatus is provided, which actuates vertically moving soldering irons, raising and lowering the soldering irons above the disc. By this apparatus it is claimed one man can solder a large number of tin cans in a comparatively short time. A soldering iron has been invented by a German which contains a chamber into which and from which fluid solder may be drawn and forced by pneumatic action.

BAD POLICY.—An English exchange says: "A contract for \$400,000 worth of steel rails has been given by the Government to a foreign firm. Of this sum upward of \$250,000 means wages, which are to be earned by foreign workmen, while English workmen are starving. All the postal cards used in England are made abroad." English mechanics and others in England are becoming alarmed at the large amount of money which is going out of that country to support the working people of other lands.

THE IRON TRADE.—It is stated that the extent of railroad track now in process of construction in this country or in actual early contemplation, will call for no less than 2,000,000 tons of rails. This means an immense increase of business, not only in the manufacture of iron, but in every branch of industry connected with the equipment and running of new roads, increase of commercial activity, etc.

IRON FOUNDRIES IN MEXICO are said to be growing quite numerous, and the work produced is described as satisfactory on the whole. There are some machinery establishments, chiefly worked by turbines, but these yield poor results, and practically cannot compete with imported machinery. Other iron goods are not made to any extent in the country.

THE MECHANICAL AND ELECTRICAL UNIT.—A horse-power in machinery means the raising of 550 pounds a foot a second; but the practical unit of power in electrical science is the watt, which is equal to one seven hundred and forty-sixth of a horse-power. It is so called in honor of Watt, who first defined the measurement of horse-power.

SCIENTIFIC PROGRESS.

Difference Between Coke and Charcoal.

Dr. W. Thoenner, in an article published in *Stahl und Eisen*, gives the result of a series of experiments designed to bring out the comparative characters of coke and charcoal. He points out that charcoal consists of a large number of more or less regularly arranged cells, joined to one another longitudinally. The walls of the cells are easily permeable by gases, and readily oxidizable. Coke, on the contrary, contains generally separate unconnected cells or groups of cells, the walls of which are composed of dense vitreous substance which is impermeable by gases and exceeding difficult to oxidize. Coke acts differently from charcoal in the furnace, and less advantageously because of these differences. If, therefore, it were possible to cause the structure and character of coke to more nearly resemble charcoal, either by rendering it more porous without sacrificing strength or by making it more easily oxidizable, the coke would be greatly improved.

Dr. Thoenner gives the results of several analyses, from which it seems that ordinary gas coke possesses lower real and apparent specific gravity than even coke, and shows more cell space in its substance. Wood charcoal possesses three times the purity of coke, with much lower specific gravity and sometimes double the cell space. Pine charcoal, the most porous of all, possesses the densest charcoal substance. In charcoal, the smallest details of the original structure of the wood are preserved; the arrangement of the cells being such that the gaseous products of carbonization can easily escape without rupturing the substance. Consequently, when the charcoal is burnt, the entrance and circulation of oxygen in the cells is equally easy. The charcoal substance does not pass through a stage of fusion in the carbonizing process; whereas in coke the substance has been fused into a dense, impenetrable, vitreous mass, through which, in consequence of the want of continuity between the cells, the oxygen can only slowly penetrate.

The March of Scientific Discovery.

Mr. John Cox, M. A., on Monday evening delivered, at the Gresham College, a lecture, introductory to a course, on "The March of Scientific Discovery." He said that, although the importance of scientific discovery was recognized, it was questionable whether the influence which it exerted upon modern life was fully appreciated. He referred to the great advantages which had taken place during the present century, particularly mentioning steam and electric power, the latter being, he thought, still in its infancy. By the aid of science all quarters of the globe had been brought in daily communication, and in every department of industry, where mere brute force was required, the labor was being taken from the shoulders of men and placed upon machinery, and great scientific discoveries necessarily brought about great social changes.

In the course of the lectures which he would deliver, his endeavor would be to draw particular attention to the intimate connection which existed between the different branches of science. The simple laws of motion stood at the beginning of the study, and when they were thoroughly understood, they would be able to understand the conservation of energy and the connection which existed between the different branches of science in relation to the methods by which discoveries had been made. From the time of the Greek philosophers, until 200 or 300 years ago, hardly any progress was made, but that which had been made since was very great, and it seemed likely to go on, because people had learned to rely upon facts rather than upon arguments and theories. In conclusion, he said that his object was not to give any description of the latest modern discoveries, but rather to accept the march of science as a whole from the earliest principle up to the present time, keeping in view the close connection between the different branches, and by means of illustration to show the method by which it had moved forward. —*London Iron and Steel Trades Journal.*

THE NORTH POLE.—Dr. Nansen is now to make an effort to discover the north pole. His hopes are founded upon the theory that there is a warm ocean current from the north coast of Siberia sweeping across the ocean from that point to and down the east coast of Greenland. The north pole, he believes, is in the direct track of that current. He is convinced that this theory is true from the fact that some portions of the cargo of the ill-fated Jeannette were found some two years after her wreck near the southern point of Greenland. He is confident that if he can place a vessel in that current, which must be warm and in an open sea, he can reach the pole without any serious obstruction from ice. This was evidently the theory and intent of the lamented De Long. The day before the Jeannette left San Francisco harbor the writer of this paragraph had a long and confidential interview with one of the members of the scientific party on board the Jeannette, who told us that the first we should hear of the ship would probably be from off the east coast of Greenland; that they expected by sailing in a north-

west direction, after passing through Behring straits, to reach a northeasterly warm current which would take them directly to the east coast of Greenland. That the Jeannettes actually reached the border of such a current is evidenced by the fact that the floating materials from the wreck above alluded to could not have reached the place where they were seen upon any other hypothesis.

ELECTRIC CURRENTS IN THE SKIN.—An interesting study has been lately made by Herr Tarchenoff of electric currents in the skin from mental excitation. Unpolarizable clay electrodes, connected with a delicate galvanometer, were applied to various parts—hands, fingers, feet, toes, nose, ear and back, and after compensation of any currents which occurred during rest, the effects of mental stimulation were noted. Light tickling with a brush causes, after a few seconds' period of latency, a gradually increasing strong deflection. Hot water has a like effect; cold, or the pain from a needle-prick, a less. Sound, light, taste and smell stimuli act similarly. If the eyes have been closed some time, mere opening of them causes a considerable deflection from the skin of the hand. It is remarkable that these skin currents also arise when the sensations are merely imagined. Mental effort produces currents varying with its amount. If a person is in tense expectation, the galvanometer mirror makes irregular oscillations. In all the experiments it appeared that, with equal nerve excitation, the strength of the skin-currents depended on the degree to which the part of the skin bearing the electrodes was furnished with sweat-glands. —*Electrician.*

THE COLORS OF A SUNBEAM.—We speak of the sun's light as colorless, says the author of "The Story of the Heavens," just as we speak of water as tasteless, but both of these expressions relate rather to our own feelings than to anything really characteristic of water or of sunlight. We regard the sunlight as colorless because it forms, as it were, the background on which all colors are depicted. The fact is, that white is so far from being colorless that it contains every hue known to us blended together in certain proportions. The sun's light is really extremely composite. Nature herself tells us this, if we will but give her the slightest attention. Whence come the beautiful hues with which we are all familiar? Look at the lovely tints of a garden; the red of the rose is not in the rose itself. All the rose does is to grasp the sunbeams which fall upon it, extract from these beams the red which is in them, and radiate that red light into your eyes. Were there not red rays commingled with the other rays in the sunbeam, there could be no red rose to be seen by sunlight.

THE SPIRIT OF THE AOE.—There is no such thing in this day and generation, aptly says the *Medical Visitor*, as "making haste slowly." If the Chicago business man could be shot through a pneumatic tube into New York City in the space of a few minutes, the limited express train taking 24 hours to reach there would no longer be patronized; and if the New Yorker could land in Liverpool in less than two days via an air line, the ocean greyhounds would find their day of usefulness had fled. No one has time to build Egyptian pyramids nowadays; indeed, with every facility to visit the land of the Pharaohs, few of us have time even to stop and look at such works of art. Speed is the necessity of necessities in our time, and if lightning speed can be obtained, nothing but lightning speed will be tolerated. This rule applies equally to firing a gun, making money, or the development of science. This century has already passed through the phases of a cotton age and an iron age, and is rapidly being transformed into an electrical age.

A NEW WEATHER INDICATOR.—In experiments repeated thousands of times since 1850, M. Palmieri, director of the observatory of Vesuvius, has shown that the electricity of the earth's surface is different from that of objects above it. The electricity of the earth is usually positive, that of the air being negative in fair weather, and positive only when rain, hail or snow fall within a certain distance. The electricity of the air is due to induction, and is maintained while the inductive influence is steady, changing as it changes. Observations of the electrical condition of the atmosphere seem to give a certain indication of weather changes, while the barometer fails in some 20 per cent of cases. M. Palmieri urges a systematic testing of a standard electrometer as a weather-predicting instrument at a sufficient number of stations.

A CURIOUS ILLUSTRATION of the theory of transient currents is that given in the *Electrical World*. A steel bar fell across the terminals of a dynamo, and the immediate result was a violent surface heating that was dissipated almost in a moment when the current ceased. It was not the ordinary heating of a conductor, but a true surface phenomenon. Such an accident is a beautiful exhibition of electrical theory, and fortunately its details fell into the hands of Sir William Thomson, who promptly investigated it. It is sometimes little things of this sort that lead to the most important results, as in the historical case when the almost invisible twitch of a galvanometer needle as the circuit was broken led Faraday to the discovery of induction.

GOOD HEALTH.

ACTION OF ELECTRICITY ON THE HUMAN BODY.—Just what takes place in the human organism to produce death from an electric current seems to be an unsolved problem, writes John C. Henry in the *Electrical World*. I have had a theory in regard to this subject so long that I have forgotten whether it is original or not. It is, that when a being suffers death from an electric shock, it is a pure case of internal rupture or explosion from the generation of gas or vapor. In support of this view I would refer to the many cases in which telegraph poles are torn to pieces. My observation on the plains, where it is a very frequent occurrence, is that the lightning follows the moist portion of the pole, which is the core or heart; in this case the moisture is vaporized and an explosion occurs. The high resistance produces heat, the heat in turn, steam, and the steam an explosion. It has been suggested that death is caused by a magnetic or electrolytic effect. I know of no experiment that would demonstrate either of them, or heat, to be of any more force from an alternate than from a direct current, and yet our sages say the alternate current is the more dangerous. If this is true, we should grope around in the dark to find the other effect that may be used in the service of man.

ENLARGING THE CHEST.—Singers with no other exercise but singing acquire great respiratory power and a remarkable increase in the dimensions of their chests. Numerous observations prove that it is enough to take voluntarily a certain number of deep breaths every day to produce in a short time an increase in the circumference of the chest. If we wish to gain the same result from muscular exercise, we must choose a form of work which will increase the intensity of the respiratory effort—that is, an exercise which brings powerful muscular masses into action. We shall thus perform a great quantity of work in a short time without producing fatigue. Now the legs, which possess three times as much muscle as the arms, can perform thrice the quantity of work before being fatigued. The lower limbs are, then, more capable than the arms of awakening the respiratory need, which is proportional to the expenditure of force. Thus it is an error to demand from gymnastic exercises practiced with appliances, exercises of suspension or support, any development of the chest. The trapeze, the rings, the parallel bars, quicken respiration much less than running.—*Popular Science Monthly*.

INDOOR AND OUTDOOR LIGHT.—Most persons would say that the outside light is two or three times as strong as that within our houses. But the ratio of difference is vastly greater. Carefully prepared tables, according to *Health*, show that for a view at the seashore, comprising sea and sky mainly (with a lens and plate of a certain speed), an exposure of one-tenth of a second is sufficient. An open landscape away from the sea would, with the same lens, the same aperture, and the same plate, require one-third of a second. A fairly lighted interior would require 2½ minutes, while a badly lighted interior, such as rooms which most ladies prefer to occupy, would require half an hour to obtain an equally good picture. In other words, patients strolling on the seashore in sunny weather are in a light not two or three times but 18,000 times stronger than that in the ordinary shaded and curtained rooms of a town house; and the same patients walking along the sunny side of a street are receiving more than 5000 times as much of the health giving influence of light as they would receive indoors in the usually heavily curtained rooms.

EFFECT OF COFFEE ON MICROBES.—According to the *Lancet*, Dr. Luderitz has recently made a number of observations on the destructive power of coffee upon various microbes. He found that the organisms all died in a longer or shorter period. In one series of experiments, anthrax bacilli were destroyed in three hours, anthrax spores in four weeks, cholera bacilli in four hours, and the streptococci of erysipelas in one day. Good and bad coffee produce precisely similar effects.

SLEEPLESSNESS.—A writer in an exchange says he has discovered a remedy for sleeplessness, which he has never known to fail, which convinces him that the whole trouble arises from overstrain of the eyes. Take a small cloth—say a piece of napped towel—and fold it in two small pieces of ice at a proper distance apart to exactly cover the eyes when the cloth is laid across them. Then lie down, adjust the cloth with the ice over the closed eyes, and you will be asleep in a very short while.

KEROSENE as a therapeutic agent is highly spoken of by Dr. H. A. Gross in the *Medical World*. It cures almost all pains, from toothache to gout and rheumatism. It is deodorized in this manner: Take of coal oil, 1 pint; nitric acid, 1 ounce. Mix. Let stand for a week and pour off the supernatant oil. It does not in the least smell like coal oil.

POISONOUS LEAVES.—Never touch a vine that has three fingered leaves—that is, leaves divided into three parts. Vines that show five-fingered leaves may be banded with safety. Poison ivy has three fingers.

USEFUL INFORMATION.

TO COUNT THE REVOLUTIONS OF A SHAFT.—Several rough and ready methods of ascertaining the number of revolutions of a shaft are known to engineers, but the following one suggested in the *Manufacturer and Builder*, by M. C. Meigs of Washington, is so simple, ingenious, and, when carefully conducted, so accurate, that we are sure its reproduction here will interest our mechanical readers. A lead pencil is tied fast to the end of the shaft whose revolutions are to be counted, in such a manner that it shall describe a circle of a convenient size for observation. If, now, a piece of paper be held lightly against the pencil, the motion of the pencil will describe a circle on it. If, however, the paper be moved backward and forward while the contact with the pencil is maintained, the pencil will describe a series of loops intersecting each other. By timing the period of contact, and then counting the number of loops recorded on the paper, the number of the revolutions of the shaft will be given with close approximation to the truth.

COMPOSITION OF COLORS.—To make flesh color, mix white, crimson and vermilion. Brown: red and black. Bright brown: carmine, yellow and black. Rose: crimson, lake and white. Chestnut: white and brown. Cream: white, yellow and Venetian red. Purple: carmine and blue. Lead color: white and black. Silver gray: indigo and lampblack. Pearl gray: white, blue and black. Pearl: blue and lead color. Pink: white and carmine. Chocolate: black and Venetian red. French white: purple and white. Green: blue and yellow. Pea green: green and white. Bright green: green and white. Dark green: green and black. Orange: red and yellow. Straw color: white and yellow. Olive: red, blue, black and yellow. Buff: yellow, white and red. Vermilion: carmine and yellow. Livender: carmine; ultramarine and white. Sky blue: white and ultramarine. Umber: white, yellow, red and black. Drab: amber, white and Venetian red. Use white to produce light tints, and black to produce dark tints.

CLEANING FILES BY ELECTRICITY.—An improved means for cleaning files, which is claimed to restore them to the condition of new files, is described as follows: After being cleaned and wetted, the file is dipped between two carbons into acidified water, and the circuit of an electric current is established between the carbons and the file by means of a piece of metal, serving as a support to the file, by which the latter is suspended. The water is then decomposed by the current, the oxygen acting upon the cuttings of the file, while the hydrogen bubbles settle in the teeth and protect them against the action of the acidified water. After immersion for a few minutes, the file is withdrawn and brushed in clear water to remove the oxide of iron, and then replaced in the bath. When the cuttings are entirely cleared, the file should be immersed in an alkaline bath to remove all traces of the acid, then dried and brushed.

MR. EIFFEL, who has got his name up so high with his Paris tower, has made a proposition in connection with Mr. Edison to erect a similar structure for the Chicago Exposition, and to remain there as a permanent structure, which shall be 500 feet higher than the Paris tower. It is proposed to place many thousand colored electric lights along the structure to render it one of the most beautiful and marvelous spectacles which the world has ever seen. If the plans they propose meet with the approval of the Exposition directors, Messrs. Edison and Eiffel intend to take upon themselves all the pecuniary responsibility of the work as a private speculation.

A NEW CLEANSING PRODUCT has recently been devised at Heidelberg, Germany, which is said to be of great value for cleansing, prior to bleaching, not only cotton but all kinds of vegetable fibers. The method of manufacture is kept secret. It is a gray powder, colorless, and partially soluble in water. An analysis made by Dr. Zirnitz shows it to contain 27 per cent of soluble matters, 21 per cent of which was carbonate of soda; 30.8 per cent consisted of silica and oxides of iron and alumina; there was 34 per cent of lime, with small quantities of sulphide of lime.

BRICK FROM SLATE.—Northern manufacturers are interested in the statement that the finest brick made in the South are from the refuse of slate quarries. They have a double resisting power and absorb only one-third as much water as ordinary brick.

WELDING MALLEABLE IRON.—You can weld malleable cast-iron plates by riveting them together and using a flux of powdered borax and Norwegian or crucible steel filings, equal parts. Let the first blows of your hammer be tender ones.

TO MAKE WATERPROOF WRITING INK, an ink which will not blur if the writing is exposed to rain: Dissolve two ounces shellac in one pint alcohol (95 per cent), filter through chalk, and mix with best lampblack.

A HUGE MASS OF COAL.—The men at the Roane Iron Company's mine, near Rockwood,

Tenn., found a mammoth piece, measuring probably ten feet square, though very irregular, and by skillful manipulation they got out a block six feet by four feet by three feet, weighing 2½ tons—without doubt the largest solid piece of coal ever taken out of a Southern mine. It was perfect in proportions and squared on all sides, but in moving a piece was knocked off a corner that marred the symmetry of the whole.

ELECTRICITY.

Storage Batteries and Their Use.

A few months ago, comparatively speaking, the electrical scientists were interested only in the action of the secondary or storage battery. Some prophecies were made as to what it might be in the practical world, but these prophecies were merely looked upon as the enthusiastic expression of dreamers. To-day the country is full of storage batteries of many makes, and the Patent Office reports new inventions and improvements every week. To-day a storage battery is useful in many ways, and is almost a necessity in some cases.

As the storage battery, or, as it may more properly be called, the accumulator, stands to-day, its usefulness for work depends upon partially known laws of chemistry and common-sense laws of mechanism. The chemical laws taken advantage of by the maker of any accumulator are invariably the same.

The method of building a battery so as to make use of the chemical action to the greatest advantage, varies greatly in different batteries; but it is now pretty well ascertained that the electromotive force to be gotten out of a charged battery is, for the moment, about the same in all varieties, and that this force, when obtained, will do a certain amount of work. Quite an accurate estimate can be obtained as to what can be done in certain conditions. But the difficulty is that although batteries are chemically all alike, one battery may be more efficient than another for a short time, owing to its peculiar mechanical construction. "The less the internal resistance," says the *Electrical World*, "the greater percentage of delivered work, i. e., low resistance to a certain point. Too low internal resistance would prevent a battery from holding a charge for any length of time, if left unused. Make the battery so that the efficiency of the work being known and calculated upon, this efficiency can be counted upon always for such a length of time of use, which would make such batteries an economical purchase. Possibly, to do this might necessitate a form of manufacture or building which might show a slight increase of resistance, but which would, by its constant work, sustain the first estimate made upon it under all situations of rough work or sudden change of temperature, for such a length of time, in years, as would make the plant profitable. Such a battery built for use for constant work, under any circumstances, which will give out many times more current at once, if called for, than the normal demand might be, without any detriment to its stability, is now upon the market, and street-car traction men would do well to try it.

"All of a year's trial is necessary, in many ways of practical work, to tell what a storage battery will do under all circumstances, and how well it will stand the work without material deterioration. Laboratory tests determine very little in such cases."

Storage Battery Traction

Has come to stay, and in many places, especially abroad, it is the only way of utilizing electricity for city traffic. The reports from London have been of a much more encouraging character, and it is probably only a question of time when the present difficulties will in large measure disappear. The experiments in New York have met with considerable success, and the indications are that the storage battery car will soon become an important part of the regular rapid transit system in that city. In some way or other the horse must go, and the great first cost of cables goes far to offset the lower efficiency of the storage system.

In London, some interesting experimental trials have recently been made on the Southwark Subway with the electric locomotive, by which the trains on this new underground line are to be worked, and highly satisfactory results have been obtained. With a train of three carriages, carrying 100 persons—a speed of 20 miles an hour was obtained, and the locomotive alone ran at a speed of 30 miles an hour.

In Chicago, a syndicate of Chicago capitalists have bought the Woodward storage battery, which had propelled a street-car satisfactorily for a week, for \$300,000. Manufacturing works will be established near that city. It will probably be the solution of the street-motor question.

THE FASTEST TIME made by an electric railway is, according to the *Age of Steel*, a mile a minute by a small experimental car. On a street railway system 20 miles an hour is the fastest. The prediction is made by a writer in *Scribner's Magazine* for April, that within ten years there will not be a horse railroad in any prominent city in the country. The number of electric railways now operating and in course of construction in the United States is estimated at 179, representing 1260 miles of track.

ENGINEERING NOTES.

THE UTILIZATION OF THE TIDES.—That the enormous unused tide-power along the various city fronts of the country will soon be set to actual and economic work, goes without saying. Many inventors are at work upon this problem. Quite recently several patents have been allowed to Mr. H. B. Rankin of Boston for a "tide motor," and a company has been formed in that city to construct a plant which will make it possible, it is asserted, for the public to be supplied with motor-power for all mechanical uses at 75 per cent less than the cheapest method in the market. This motor, or a series of them, can, it is claimed, be placed upon our marginal tide-waters and easily furnish sufficient power to light the city with electricity, run the surface cars, and turn the machinery of every mechanical plant in Boston. The tide in the harbor, which rises to the height of 10 feet, and lowers 10 feet, or which moves nearly 40 feet during 24 hours, is to be utilized by tide-water motors. The Rankin tide motor consists of a float which is anchored by cables. These cables are wound around shafts which project from the sides of the float. The upper and lower ends of the cable are made fast, and of equal length. The float is sunken until it draws, say four feet of water, that is, two feet more than it allowed to float without anchorage. Being thus under restraint, any movement of the float, up or down, will cause a revolution of the shaft to which the cable is attached. This motion, increased by a series of gears and pulleys, and concentrated upon a central shaft, fitted with a series of speed wheels, will be the power need to drive the dynamos.

COMBINED WATER AND RAIL TRANSPORTATION.—A singular combination of water and rail transportation is proposed by the board of government engineers that has been investigating the obstructions to navigation in the Columbia river, South America, between the Dalls and Celilo. The board recommends the construction of a double track, standard gauge, railway along the falls and rapids a distance of eight miles, upon which steamboats shall be carried, being raised by means of hydraulic lifts, the lower of which will raise the boat 68 feet at low water and the upper will lift 40 feet. The car on which the boats are to be carried is to be 168 feet long by 33 wide, having 34 four-wheeled trucks placed in two lines of 17 each. The weight of the car is to be 300 tons and the weight of maximum load 600 tons, making the total weight of loaded car 900 tons, which is equivalent to the weight of 30 good-sized locomotives or as many heavily loaded freight cars of ordinary size. The estimated cost of this marine railway with equipment of two cars and four engines, including necessary buildings, is \$2,690,000, and to increase the capacity of road, equipment, etc., to a maximum of 40 boats will, it is estimated, make the total cost about \$3,576,000.

A SUBMARINE BOAT.—Some remarkable things have been told of the Spanish submarine torpedo boat, the Peral, and these seem to be confirmed if correct reports are given of tests recently made at Cadiz. From these accounts it appears that the speed of the boat when running on the surface was about eight knots an hour, while under water she ran between five and six knots an hour. The boat was navigated for over three hours with all connection with the outer air completely shut off, and for more than two hours in fighting trim, with only four inches of the observation turret above water. One continuous trip of 40 minutes was made with the boat entirely under the water, during which time she traveled about four miles. The machinery is said to have worked without the slightest trouble, and during the submarine trips the crew did not experience any inconvenience whatever.—*Engineering Journal*.

THE NICARAGUA CANAL.—The cost of the proposed Nicaragua canal is now placed at \$65,000,000. The distance between the oceans is 169 miles, but only 29 miles of canal will have to be dug. The San Juan river must be deepened and some artificial basins constructed in the valleys of other streams. Lake Nicaragua affords 56 miles of free sailgill. The Suez canal, which was cut out of the soil and sand for 100 miles, cost \$81,000,000. In order to facilitate work on the canal, a railroad is now in process of construction from tide-water, on the Atlantic, to the divide—a distance of about 30 miles, over which supplies and materials for construction will be transported, so that work can progress more rapidly at several points along the line.

ANOTHER SHORT CUT FOR SHIPPING.—A project is on foot to dig a ship canal from a point opposite Grand Island, in Lake Superior, to the northern extremity of Green bay in Lake Michigan, cutting across the narrowest part of the long peninsula between these two lakes. The proposed canal is to be 36 miles long and will save two days and a half for steamers and five days for sailing vessels that would otherwise have to go round the peninsula.

AROUND THE FALLS.—The proposed ship canal around Niagara Falls has been favorably reported upon by the Congressional House Committee on railroads and canals. The bill will appropriate one million to commence the work, which, it is estimated, will eventually cost twenty-three millions.

SAN FRANCISCO:

Saturday, May 10, 1890.

TABLE OF CONTENTS.

ILLUSTRATIONS.—A Sketch of Sutter's Fort in 1849; The Worthington Compound Steam Pump, 313. Monument and Statue Erected in Memory of James W. Marshall, 321.

EDITORIALS.—Sutter's Fort; The Worthington Steam Pump, 313. Passing Events; The Silver Question in Congress; Southern Nevada; Hydraulic Mining; Dutiable Sodas; The Mechanics' Fair; The Grand Canyon Discoveries, 320. The Marshall Monument; The Molders' Strike, 321.

CORRESPONDENCE.—The Foundry at Sonora; Road Work in Mendocino County; The Deep Gold Placers of California, 314.

MISCELLANEOUS.—Gold and Silver Product; An Important Measure in Forestry Reform, 314. The Irrigation Survey; Advantages of Advertising, 315.

MECHANICAL PROGRESS.—The Difference Between Siemens-Martin Steel and Siemens Steel; The Fusing Point of Blast Furnace Slags; Malleable Bronze; Woven Wire Belts; The Measurement of Drawn Wires; New Invention in Glass Industry; Sewing Machines in Germany; Improvements in Soldering; Bad Policy; The Iron Trade; Miscellaneous, 318.

SCIENTIFIC PROGRESS.—Difference Between Coke and Charcoal; The March of Scientific Discovery; The North Pole; Electrical Currents in the Skin; The Colors of a Sunbeam; The Spirit of the Age; A New Weather Indicator; Miscellaneous, 318.

GOOD HEALTH.—Action of Electricity on the Human Body; Enlarging the Chest; Indoor and Outdoor Light; Effect of Coffee on Microbes; Sleeplessness; Miscellaneous, 319.

USEFUL INFORMATION.—To Count the Revolutions of a Shaft; Composition of Colors; Cleaning Files by Electricity; Miscellaneous, 319.

ELECTRICITY.—Storage Batteries and their Use; Miscellaneous, 319.

ENGINEERING NOTES.—The Utilization of the Tides; Combined Water and Rail Transportation; A Submarine Boat; The Nicaragua Canal; Another Shot Cut for Shipping; Around the Falls, 319.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 316-317.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board; Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 324.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 324.

Passing Events.

The molders' strike seems to be approaching an end, as more molders have arrived from the East to take the places of the strikers, and all the shops are now supplied except one. There have been some acts of violence during the past week, men having been beaten and ill-used when outside the shops, presumably by strikers or sympathizers.

The great cantilever bridge across the Colorado, having the longest span of any cantilever bridge in the world, was completed this week. The bridge is 960 feet long, with a span of 360 feet.

On Saturday last the statue of Marshall, the discoverer of gold in California, was unveiled at Coloma, with appropriate ceremonies.

The eight-hour system has gone into effect with the building trades of this and other large cities without disturbance of any kind. It is said now that the coal miners throughout the country are preparing to quit work. Steamboatmen and firemen, tanners and waiters are also considering the question.

There is nothing of special interest in the mining situation aside from what is mentioned in our "Mining Summary" on another page. The advance of spring has started up many mines, but there is still a large quantity of snow on the higher mountains.

The Yuba Mining and Smelting Co. have purchased most of the principal mines in the Bristol range, Lincoln Co., Nev.

The Silver Question in Congress.

The United States Senate has at last taken up the Jones Silver bill, and it now looks as if it will be pushed to a finish. At this writing it is hardly safe to predict in what shape the bill will be passed, but judging from the published expressed views of leading senators, it will be amended still further in favor of bimetalists, with free coinage as a certainty in the near future. It is quite certain that the hullion redemption clause in the Jones bill will be omitted or canceled, and that Treasury notes issued in payment of the monthly purchases of 4,500,000 ounces of silver, will be redeemable in lawful money. This will make the Treasury notes take precedence over every other kind of paper currency, and will give them a fixed value abroad.

There is no denying but the prejudice entertained in the Eastern States against silver is wearing away under the already favorably felt influence of the advance in the price of silver. The recent advance had a stimulating effect on nearly all kinds of industries by reviving confidence, and at the same time promoting a more speculative feeling in every kind of leading securities.

That the action of Congress on the silver question is closely watched abroad, is verified by the following press telegram from London:

Mr. Gibbs, ex-governor of the Bank of England and president of the Bimetallic League, called Senator Jones in the name of the Bimetallic League, "deeply regretting the death of Senator Beck, whose services in the cause of monetary reform are most warmly appreciated," and adding: "The Bimetallic party in the United Kingdom, now including over 100 members of the House of Commons, attaches the greatest value to the debate about to commence in your illustrious chamber. We fully recognize, not only that the support afforded silver by your legislation during the past 12 years has helped to protect the industrial world from acute monetary crisis, but also that the debates in Congress have served more than all else to educate our people to the recognition of the important issues involved. We believe, also, that the increased coinage of silver contemplated by Congress will restore, wholly or considerably, your coinage rates, and will thus make an international settlement of this complex question comparatively easy. We anticipate further, with much confidence, that the advance in the price of silver, which must follow your action, will stimulate the export trade of your country, and, while tending to the prosperity of your agricultural classes, will also assist the manufacturing industries of the United Kingdom and the whole body of our wage-earners."

Southern Nevada.

D. O. Mills is now in San Francisco and is considering the extension of the Carson & Colorado railroad southward from Owens lake. Surveys have been made for a 50-mile extension and are now in his possession for perusal. This road has benefited Esmeralda Co., Nevada, and Inyo Co., California, and its extension southward will have the effect of opening up other mineral regions along its line.

The counties of Lincoln, Nye and White Pine are isolated from railroad connection, and these, with Eureka and Esmeralda, form a large extent of mineral region much of which is yet vacant. Several good gold-veins have been discovered lately at Irish mountain, not far from Logan and Hiko, Lincoln Co., but this, like the whole region, lacks railroad facilities as yet. This will be remedied by the extension of the Utah Central beyond Pioche to a connection with the Atlantic & Pacific. Nye county has a great number of promising districts which will eventually come to the front, but at present it must be very rich ore indeed to pay. All through the section referred to are numbers of isolated mines, groups and districts that capital has neglected almost entirely, owing to the lack of transportation facilities. There is much unprospected and undeveloped land which is of little value until there are railroads within reasonable distance.

SMELTING WORKS CLOSED DOWN.—A special to the Chicago Times from Helena, Montana, says: The Helena & Livingston Smelting Co., located at East Helena, and the Great Falls smelter have closed down. The cause of suspension is difficult to get at, but from what can be learned the chief factor in closing down is the exorbitant freight rates on ore to this point as compared with the rates to Omaha and other Eastern smelting points.

Hydraulic Mining.

The Nevada Transcript is responsible for the following statement: "The hydraulic mines at Dutch Flat that empty their debris into the American river are running regularly, and they are not infringing any law in doing so. The Natoma Water Company's stone dam at Folsom is successfully impounding all the eluvions and nobody is being injured, while a great deal of gold is being added to the country's wealth and many men are given employment."

If it is a fact that these mines are running with the above result, it simply verifies the prediction made by the MINING AND SCIENTIFIC PRESS last December, that the dam in question would serve a purpose from an engineering point of view, having a decided bearing on the much-discussed debris question. Although not built for such a purpose, there is no doubt of its catching a large amount of debris. The small dams built by companies on side streams could give no such illustration of the possibility of impounding debris as the large dam built by the State on a main stream.

The Anti Debris Association has given out for publication an account of hydraulic mines in operation, being the substance of reports from the association's agents in the mountains. This statement says no hydraulic mining is going on at Dutch Flat, notwithstanding reports to that effect, but that there are two monitors at work at Gold Run. Three miles farther down there are two Chinese hydraulic mines in operation, and there are one or more at Iowa Hill. All these discharge into the American river.

The association is informed that there is no hydraulic mining on Bear river, and that the stream is clearer at Dutch Flat and above than for many years. On the South Yuba, at Columbia Hill and Union Hill, there is no hydraulic mining. At Union Hill a small hydraulic mine recently ceased operations to avoid suit. The North Bloomfield is using only one monitor, and its only water supply is from Humboldt creek, the main ditch being out of repair. The debris is going into the settling reservoir from the upper part of the mine. The North Bloomfield is the only hydraulic mine at work on the South Yuba. On the Middle Yuba, one hydraulic mine is reported in operation. On the North Yuba a small hydraulic mine is in operation at Oak Flat. A gang of Chinese is also working with a pipe a mile below Downieville. At Eureka North two hydraulic monitors are running. At Brandy City one monitor is in use in the Arnett mine and two in the Lawrence mine. Richards' mine, at Eureka North, is using one monitor. On the Feather river, in Plumas county, hydraulic mining is reported in a number of localities. A mine worked by the hydraulic process on Rattlesnake creek, Nevada county, ceased operations after notification from the association.

Dutiable Sodas.

EDITORS PRESS.—Kindly inform me at your earliest convenience what quantities of soda ash and other dutiable sodas—bicarbonate, etc.—were imported by California and the Pacific Coast in 1889; also what is the duty per ton upon soda in its various forms.

C. W. C.

Independence, Inyo Co.

[The following table shows the imports in pounds at San Francisco for the past three years:

	1887.	1888.	1889.
Caustic soda.....	2,650,743	3,924,288	2,303,826
Soda ash and sal-soda.....	3,393,328	6,260,169	4,195,158
Bicarbonate of soda.....	420,399	416,068	223,061

The duty on soda ash is one-fourth cent per pound and on bicarbonate of soda 1½ cents per pound. That on hyposulphite and all carbonates is 20 per cent. On hydrate or caustic soda the duty is one cent per pound; on sal or crystal soda, 20 per cent; and on silicate one-half cent per pound.—EDS. PRESS.]

CARBONATES.—A Great Falls, Mont., special says: Reports from Barker confirm the news of great finds of carbonates and galena in the May and Edna mines, and also in mines which have been christened the America and Columbus. The discoveries produced a profound sensation, and workmen on the Great Falls extension of the Great Northern Railway line, and miners from other sections, are staking out claims on the new treasure held.

THE Singer Sewing-Machine factory at Elizabeth, N. J., was almost entirely destroyed by fire on Tuesday night. The loss is about \$3,000,000.

The Mechanics' Fair.

At a meeting of the Mechanics' Institute it was decided to open the Twenty-fifth Industrial Exposition on Thursday, Sept. 18th, and to close Saturday, October 25th, in compliance with the request of the Society of Pioneers and the Native Sons of the Golden West, to whom the use of the exposition building on the 8th, 9th and 10th of September was granted for the purpose of celebrating the fortieth anniversary of the admission of the State of California.

A resolution introduced by Trustee George E. Dow was unanimously adopted, to the effect that at the forthcoming exhibition the whole of the Grove-street side of the Pavilion or as much thereof as may be necessary shall be devoted to the exhibition of electrical apparatus and appliances, and the Secretary was instructed to notify all agents and manufacturers of electrical apparatus to make early application for space. This is a good move. We have never had in this city anything like a good exhibit of electrical appliances. Of late years these have increased in number and design wonderfully and it will be a revelation to many to learn what a variety is now made. The Electrical Society of this city might greatly aid in this matter by getting manufacturers and agents interested.

It is greatly to be hoped that the manufacturers and dealers in California will interest themselves this year and bring out a good exhibit of our industrial resources. This fair is not a local one by any means, and all parts of the State should be represented. During its continuance it is visited by people from all the counties of California. Those who exhibit have an opportunity of showing what they make or sell to thousands daily. Here the products are seen in their most attractive form and can be examined carefully. Such an opportunity should not be missed and those who make early preparation and application for space will have the best advantages.

The Grand Canyon Discoveries.

There have been all sorts of more or less improbable stories of late about mineral discoveries in the Grand Canyon of the Colorado. Men are reported as having seen ledges along the wall of the canyon, and others have been panning out gold in the river-bed. A press report was recently sent out from Denver stating, on the authority of Col. R. B. Stanton, chief of the surveying party which went through the canyon last winter, that a great number of gold and silver ledges had been discovered. The editor of the Mohave Miner (Arizona) says Col. Stanton positively ascertained him that, with the exception of the already known placer mines, he knew of no other gold or silver indications in the entire canyon. The Miner quotes a letter from a prospector who has gone to the recent discoveries (?) which says: "We are here all right. They have a large heap of sulphurets which will go about 60 cents to the ton. There are about 20 men here. The majority of us will go back in a few days. Tell your friends to keep away from here."

So far, the richest rock found in the new strike north of Flagstaff assayed but 190 ounces in gold or silver, mostly the latter; but other samples sent to the Miner only assayed from 6 to 24 ounces in silver per ton. The ledge are large, but of low grade. There seems to be no reason to believe that the reports sent out can be relied on to the effect that mineral of great value can be found anywhere a pick is struck. It will take further developments to prove whether the district is a good one or another Harqua Hala.

DODGE MILLS.—S. L. Burbridge, superintendent of the Grand Prize mine, Payson, Gila county, Arizona, writes to Mr. Dodge, care of Parke & Lacy Co., as follows: "The little mill is running very smoothly and working from 10 to 12 tons of very hard ore, through a No. 40 screen, per 24 hours, and I consider that it is a closer amalgamator than either a stamp-mill or an arastra. I believe when ordinary intelligence is used in running your mills, that they will do all if not more than you claim for them."

THE Virginia Enterprise says that as to the milling outlook it has never been better since mills were erected on the Carson river. The indications are that the water will hold out nearly all summer.

The Marshall Monument.

On Saturday, May 31, the statue of James W. Marshall, the discoverer of gold in California, was unveiled at Coloma, El Dorado county, near the spot where the first gold was found. The Legislature provided the funds for this monument, which was designed by F. Marion Wells, the accomplished sculptor, who has executed his task with skill. The statue represents Marshall in the dress of the period. He is facing the river. In his right hand he holds a golden nugget, while with his left index finger extended he points to the exact spot where the ever-memorable discovery was made. The statue is grand in proportions and workmanship, and the design is quite historical.

The monument is now completed, and stands 39 feet 6 inches in height, and is of admirable proportions. The cap of the pedestal is five feet square, on which the statue of Marshall is placed. The statue is heroic in size, being 9½ feet in height, representing Marshall dressed in miner's garb. On the north side of the monument is the inscription of the Great Seal of the State; on the south side, a view of Sutter's mill; on the east side, the names of the Commissioners, A. Caminetti, John H. Miller, George Hofmeister and H. C. Geesford, with a legend reading: "The site for this monument is a gift to the State of California from Placerville Parlor, Native Sons of the Golden West."

On the west side of the monument are the words: "Erected by the State of California, in memory of James W. Marshall, the discoverer of gold. Born Oct. 10, 1810. Died Aug. 10, 1888. The first nugget was found in the race of Sutter's mill, in Coloma, Jan. 19, 1848."

On this page is a photo-facsimile of the entire monument. We have before this given several sketches of the life of Marshall and an account of his famous discovery, so that it is unnecessary to repeat this at this time.

On the occasion of the unveiling of the statue on Saturday last there were many distinguished men present. Senator Caminetti, of the Commissioners, delivered the monument to Governor Waterman as the representative of the State. The Governor made a brief speech, and Mrs. J. I. Reed of Placerville read a poem in enology of the discoverer of gold. Senator A. F. Jones of Oroville was the orator of the day and delivered an eloquent oration. P. S. Lawson, President of the Sacramento Pioneers, also spoke, as did several others. The Native Sons of the Golden West and the Sacramento Society of California Pioneers were in charge of the ceremonies.

MINES AND PROSPECTS.—The stocks listed at the Colorado Mining Exchange at Denver are divided into two classes, one being "mines" and the other "prospects." Under the head of "mines" are stocks representing productive properties, which are paying dividends, and under that of "prospects" are mining claims in which good bodies of ore have yet to be found. When a reporter suggested to a local broker that this would be a good example for the San Francisco Stock and Exchange Board to copy, he replied: "It isn't healthy for our business to let the public know too much about these matters. If the list were thus to be classified, nine-tenths of the stocks would go under the head of 'prospects,' and that wouldn't make a good showing."

A CENTRIFUGAL CONCENTRATOR is to be put in at the Boston Smelting Works, Butte, Mont., where, according to the *Helena Independent*, the system of treating gold-bearing pyrites has been most successful. A small amount of fluxing material is mixed with the ore, and by means of a hot blast the sulphur contained in the ore is made to create a heat sufficient to smelt the whole mass and make it run like water. By combining these two processes together, the centrifugal concentrator and the hot-blast treatment, a saving of at least one-fourth can be made over the old manner of treatment.

THE JACKSON CREEK copper mines, which were abandoned a year ago, have been relocated by miners from Cedar district. These mines are situated about 45 miles northwest from Winnemucca, Nev.

An oil well was struck recently in Torrey Canyon, Ventura Co. that flows 200 barrels a day.

The Molders' Strike.

It looks at present as if the molders' strike in this city would soon come to an end. Several more men were brought from the East this week and have gone to work in the shops in place of the strikers. The Pacific Iron Works, one of the large foundries, has again started up with a quota of men on the molding-floor. In fact there is now only one institution which remains closed—that of Byron Jackson—and other foundries are doing his work for him. The manufacturers profess themselves pleased with the state of affairs, and consider that they have overcome the worst obstacles. Although not full-handed in the molding-room, they have competent bands enough to get along with. There have been some disorderly proceedings this week in which some of the working molders have been beaten and injured by

CHINESE MINERS IN IDAHO.—Judge Willis Sweet, in the District Court at Mont Idaho, has decided that Chinese have no rights whatever on mining lands in the United States. The decision was rendered in a suit brought by Chinese against Patrick Flynn et al., who last summer jumped claims on the Moose creek, in the Elk City Mining District, held by the Chinese for many years under a bill of sale given to the Chinese by white men. In another decision, involving the Buffalo Hill claims in the Elk City District, white men having leased the said claims to Chinese and being jumped by whites, the judge held that a lease of mining ground to Chinese was invalid and amounted to the abandonment of their claim, unless the plaintiff proves that the Chinese lessees were actually employed to hold and work said ground on behalf of the plaintiffs. The suit for ejectment was therefore denied. Upon

THE MARSHALL MONUMENT AT COLOMA.

men supposed to be strikers, or in sympathy with them. Steps have been taken, however, to prevent any further demonstrations of this nature.

THE BULLY CHOOP SUIT.—The great Bully Choop mining suit of George A. Cornwall of Napa against ex-Senator C. F. Foster of Red Bluff has been decided in favor of the defendant. The suit involved the undivided half interest claimed by Cornwall in a valuable group of mines in Shasta county. His interest was based upon a verbal contract to purchase one-half interest in the mines, which were bonded by Foster in his own name, and who refused to convey the half interest to Cornwall. The judge held that the plaintiff by his own acts had forfeited all his rights under the verbal contract, and judgment was entered in favor of defendant. The case will be appealed.

THE MINERAL section of Irish Mountain, some 220 miles south of Eureka, Nevada, is said to be a very promising one, but there is no means of transportation and the claims are undeveloped.

THE company operating on Cedros Island off the coast of Lower California is shipping enormous ore to San Diego for treatment.

the announcement of the decisions, parties were immediately organized to oust Chinese miners in Pierce City, Elk City and other mining camps in Northern Idaho, which are Chinese strongholds.

A MOVEMENT is on foot among the salmon cannery men and agents to come to some understanding whereby the production of the coming season will not be as large as it was last year. The most careful estimates show that there is still a stock ranging from 200,000 to 250,000 cases of 1889 salmon in the hands of the producers. Advice from Portland, dated April 15th, says: "Owing to a dispute between the cannery men and the Fishermen's Union no salmon are being canned on the Columbia, and the headquarters of the salmon business is at present in this city. There are a good many fish running in the Willamette, and parties are fishing despite the union and selling tons of fish here for three cents a pound. The fish are being salted in barrels and shipped by the carload for Germany and Russia, where the salt will be extracted by some peculiar process and the fish canned, thus avoiding the duty on canned goods. Unless the trouble between the fishermen and the cannery is settled, a very large amount of salmon will be disposed of in this way. The fishermen on the Columbia a year ago got 50 cents a fish. They organized as fish become scarcer and fishermen more numerous and got 50 cents, then 75 cents and finally \$1 a fish. This year they are striking for \$1.25."

Silk Culture in California.

We alluded recently to the progress shown in the last report of the Ladies' Silk Culture Society of California, and urged that the organization was enthusiastic in its work, and was working for the public interest alone. We notice that Representative Morrow has presented in Congress a memorial which was referred to the Committee on Agriculture as follows:

"The members of the Board of Directors of the Ladies' Silk Culture Society of California respectfully represent that the Ladies' Silk Culture Society has been duly incorporated and has an organized existence for more than five years, during which time it has energetically encouraged silk culture in California. Fifteen acres of land have been purchased at Piedmont, Alameda county, seven acres of which were planted with mulberry trees, sufficient to yield an immense quantity of leaves for feeding the worms. In addition, a cocoonery has been built, and the society has distributed great quantities of silkworm eggs to all parts of the State."

The society feels that any effort to divert Government aid to new and untried channels would involve an unwise and useless expenditure of public money. The effect of such experimental work would be the placing of silk culture where the ladies found it five years ago.

There is much significance in this last claim which is urged upon the attention of Congress. There are silk projects which do not enjoy the confidence of the California people, though they may be zealously advocated at Washington.

THE SECRET OF CHEAP BUILDING.—A man who is resolved to be independent of landlords can build a very comfortable house for from \$2000 to \$2500. He can have sufficient room, and a house with a decent exterior and a plain interior. He ought, first and foremost, to provide a bath-room, even if he cannot buy a slate mantel. It will be the wisest in the long run to have a bath-room. Ask any woman who has had the care of two or three children how much a bath-room saves her. The larger the family, the greater the saving in work and worry, which is more wearing than work. If a man has only \$2000 and a large family, he must sacrifice something or deny himself something when he builds. If he is wise, he will contrive closets and cupboards, a style of house that renders running up and down stairs unnecessary (there is nothing so tiresome as going up and down stairs), make his dining-room large enough for a living-room, and see that the arrangement of the kitchen is labor-saving. Bay windows and pretty trimmings can all be dispensed with. There are people who do not seem to have any clear idea of the things that are appropriate in a cheap house. Substantial fixtures rather than pretty trimmings are what is needed in a cheap house. Good ventilation, ample room, plenty of light and warmth, may be obtained if a man desires to insure it in building for his own use, at a very moderate outlay. But then he must hold to please himself instead of vying with his neighbor.

FIREPROOF SHUTTERS AND DOORS.—The Boston Manufacturers' Mutual Insurance Company says that the best fire doors and shutters are made of two or three thicknesses of solid wood so adjusted to each other as not to be liable to warp, and covered with sheet iron or tin plated with the joints carefully looked. The wood will become carbonized, but the sheet metal will keep out the oxygen and prevent burning, so that the door or shutter will remain solid and strong for many hours, while iron or steel shutters would warp and bend and fail to keep the opening closed.

A NEEDED WORK.—The Government appears to have under serious consideration a proposition to construct a canal around Niagara Falls to accommodate American lake shipping and war vessels in case of an emergency. According to the plans under consideration, it will cost \$23,000,000 and will have a depth of 20½ feet. The necessity of such a canal, it is argued, is made apparent by Canadian discrimination against vessels of the United States passing through the Welland canal.

FIREPROOF CONSTRUCTION.—In the line of fireproof construction a Philadelphia architect has the honor of introducing the latest novelty. His specifications for a large ten-story apartment house now building in that city call for floors of asphalt with a skirting of strips of wood adjoining the partitions imbedded in the asphalt and level with its surface. It is intended to lay the carpets on the asphalt and tack the edges to the wooden strips.

WOOD PULP INSTEAD OF PLASTER.—Wood pulp is now being used as the basis of a plastic compound to serve as a substitute for lime mortar in covering and finishing walls. It is designed to possess, in addition to all the desirable qualities of ordinary mortar, the characteristics of being harder, and when applied to woodwork in a thin coat, rendering it both fire and water-proof.

The estimated cost of completing the Panama canal is \$90,000,000 francs, and even with that amount it would take seven or eight years more work.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

THE ZANDER LAMP-BURNER.

No Trouble to Put in the Wick.

This Patented Burner has a slide-plate *b* on the wick-tube *B*, with grooved flanges *b'*. The slide-plate is removed from the tube *B* and the wick inserted through the open side, the wick edges being easily pressed in past and under the edges of the tube. The slide-plate is then put back, fully inclosing the wick. With this it is unnecessary to force the wick through a closed tube and past its ratchet wheels. THIS PATENT IS FOR SALE. It is one of those every-day-use practical inventions of merit that will take. Address LOUIS ZANDER, 1225 Twenty-first Avenue, East Oakland, Alameda Co.

BAND COUPLING.
 Best in the World. Most Simple in Application. Most Powerful—Cheapest. Ball and Socket Joint. Right and Left Screw Works Freely. Just the thing for Large Tanks in a Dry Climate.

WELLS, RUSSELL & CO., Tank Builders
 Mechanics' Mills, Cor. Mission & Fremont Sts., S. F.

GRANGER'S ROLLER STAMP MILL
 Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
 A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR
 The very best. Uses no water. No freezing up. Saves hauling waste. Saves high percentage. Send for circulars.
 A. P. GRANGER, Denver, Colo.

WORTHINGTON STEAM PUMPS!

Will Contract to Pump any Elevation at One Lift.

We are pumping through one continuous line of pipe 114 miles long against a pressure equal to 1500 feet elevation.

WE HAVE MORE PUMPING CAPACITY
 SUPPLYING WATER WORKS

Than all other Manufacturers in the United States Combined.

WE BUILD PUMPS FOR EVERY PURPOSE

FOR WHICH PUMPS ARE USED,
 And against pressures up to 8000 pounds per square inch.

Send for Illustrated Catalogue.

BRYAN'S ROLLER QUARTZ MILL.**NEW COMMON SENSE STEEL WHIM.****All Complete for \$150.**

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

"Sensible" Horse Power Hoisting Whims.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight, two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished, showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

A Wet-Crushing Silver Mill.

For milling ores, those that admit of direct amalgamation without preliminary roasting, can be treated the most economically. These ores, after passing through grizzly, rock-breaker and ore-feeders, are crushed in the battery, the pulp passing from these to settling-tanks, or if the Boss Continuous Process is used, directly to the pans.

When the crushed ore and water, or pulp, is discharged from batteries into settling tanks, it is allowed to remain standing until the ore has settled to the bottom. The water is then pumped off into tanks provided for the purpose and used again in the mortars.

The crushed ore remaining in the tanks is shoveled out and into the pans in regular charges of from one to two tons, according to their capacity. Water is then added until the pulp is of the proper consistency, and which is then thoroughly stirred and ground between the shoes and dies in the pans. Salt, bluestone and other chemicals, such as may be required for the proper treatment of the ore, are added; and, after the pulp is sufficiently ground, the muller is raised so that the shoes and dies no longer grind, and the quicksilver is introduced in sufficient quantity. By the action of the currents formed in the pan, the quicksilver is disseminated in small particles throughout the pulp, thus coming in contact with the precious metals and forming amalgam. The ore is treated in the pans from one to eight hours, according to its character. From the pans the pulp with the amalgam and unused quicksilver is discharged into the settlers placed immediately below the pans, one settler, as a rule, taking the pulp from two pans.

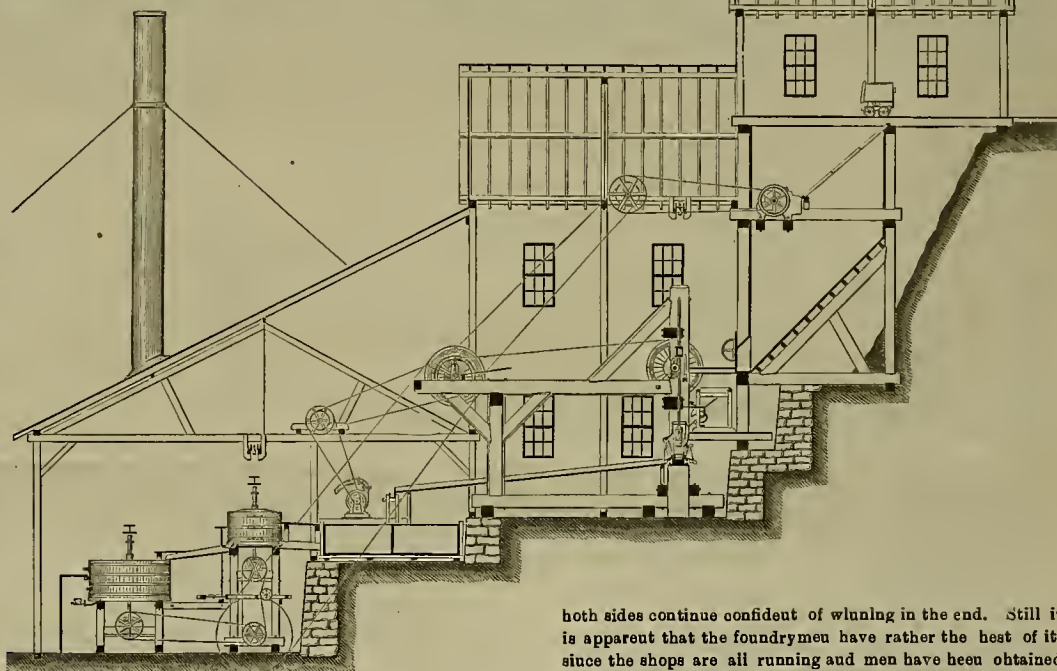

Here more water is added for the purpose of thinning the pulp and allowing the quicksilver and amalgam to settle to the bottom, while the lighter pulp is kept in suspension by slowly revolving stirrers. This is now drawn off through discharge spouts in the sides of settlers and allowed to run to waste. The quicksilver and amalgam that have collected in the bottom of settler are drawn off and strained so as to separate the superfluous quicksilver from the amalgam. The amalgam remaining in the strainer is then placed in retorts; the quicksilver being vaporized by the heat, leaves behind the gold and silver, which are then taken out in retorts, melted and run into ingot molds.

The engravings show a standard type of a wet-crushing silver-mill of this class, as made by the Fulton Iron Works of this city. A sluice will be seen leading from batteries to settling-tanks in front of and below them. The pans immediately below the tanks are now charged by settled pulp out of the tanks, and after grinding and amalgamating are completed are discharged into settlers.

The Molders' Strike.

Several more molders from the East arrived this week and were at once put at work in the foundries without molestation. Still others

are expected shortly. The Union Iron Works now has its full quota of molders, though some of the other foundries are still short-handed. This is the eleventh week of the strike and

WET-CRUSHING SILVER MILL.

both sides continue confident of winning in the end. Still it is apparent that the foundrymen have rather the best of it, since the shops are all running and men have been obtained from the East. When the strikers get any of the imported men to leave, others are brought to fill their places.

Some Japanese molders applied for work at one of the big foundries this week, but, although they were found to understand their business, they were not given employment. The foundrymen say they can get all the men they want from the East, and that they will be able to keep their shops running steadily in the future.

CONCENTRATION WORKS PURCHASED.—Allen C. Mason of Tacoma has purchased for the Parke & Laoy Machinery Company of Portland, Or., the concentrating works in the Salmon River mining district in Eastern Washington, on which over \$40,000 has been spent. He also purchased with it between 15 and 20 silver mines in the Conconully district, and, with the Lone Star mine, which he previously owned, now has the most and the best mining properties in Washington.

BARKER DISTRICT, MONTANA.—Supt. Emrick of the Montana smelter at Great Falls has returned to Helena from his tour of inspection of the Barker district. He says there is an abundance of lead ore there and that the smelter will begin operations on June 1st. The finding of the large bodies of lead ore will enable the smelters of Montana to resume operations. The discovery in the May and Edna mine is equal to first reports.

PLAN OF TWENTY-STAMP WET-CRUSHING SILVER MILL, TANK SYSTEM.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Mines and Mills of Shasta County.

NUMBER II.

[From our Travelling Correspondent.]

Three miles above Redding is Middle Creek, a R. R. depot for the upper Trinity county travel. There are here, also, postoffice and telegraph facilities, a hotel and a fine well of water to refresh man and beast. Within a short walk from the hotel is the once celebrated tellurium mine of Shearer & Ratler. From this mine was taken some of the finest specimens of telluride of gold that have been found in the State; a large lot of this ore was sent to Colorado, where it is said, it was treated successfully, but the expense attending the shipments gave too little profit. There have been several attempts to work the ore on the spot but without success. The value of this property is an unsettled question, from the fact that there is not over 60 feet of depth to the mine. Of late it has changed hands, and is now owned by a company who are running a tunnel for striking the lode at the depth of about 130 feet. The vein is in what may be called a trapish slate. The rock, as vein matter, is heavily sulphuretted, and you see at a glance that for treatment, it wants to be in skillful hands.

About a mile above Middle Creek, on the road to Shasta, is the Gem mine and mill. This mine has a development of about 100 feet, and has produced considerable gold, exactly how much I will not undertake to state. The rock, however, is good for pay, and the mine has a better future on development. The lode varies in size, from a small seam to four and five feet; all the rock is milled. There is here a fine 10 stamp mill now run by water-power, but at the time of my visit they expected to close down for want of water. They also have steam-power. The amalgamating appliances to mill are copper plates and blankets—a long string of blanket sluices, which are at stated times swept down. The property, I was informed, belongs to Miller, Evine & Simons. Not far from this mine, on Salt creek, is the Pugh & Co. mill; this is a Kendall rocker-mill. This is also run by water-power, they having a Knight 40-inch wheel (the wheel at the Gem is a Pelton). This mill having been but recently put up, they are hardly in shape for big work, but what they will do, or rather have done, has been very satisfactory; they are working small lots of ore from surrounding mines. From the arrangements, considering facilities at hand, Mr. Pugh gives evidence of having had experience in gold extraction.

Between here and Shasta town, which is less than three miles distant, there are any number of what I will call prospects, but they call them mines here. The whole country is riddled with veins of quartz, but how valuable they are, no one knows, as there is no development to determine. There are a few, I should say, who are doing some development. A San Francisco company known as the Mountain View is driving a tunnel which will give some 200 feet on their lode. This company has a good property, taking a surface view of it, and they are at work in a way that means mining in the right direction, and which I hope will be profitable as a reward for labor and money.

Ruby, Washington.

EDITORS PRESS:—There is very little to communicate from this part of the country. The principal mines were stopped last December, 1889, since which time little has been done, owing to the large amount of snow and bad condition of roads for teaming. The company are in readiness to operate, and are anxiously waiting for the snow to disappear. The Arlington mill will be completed this season, and will be a gigantic plant with a capacity of 80 tons daily. The Fourth of July mine, owned and operated by a Montana company, are working about 12 men. Their intention is to put on hoisting machinery and sink a two compartment shaft this summer. They have a splendid prospect, and without a doubt the making of a good mine. There has been a heavy loss of stock all over this portion of the country—at least 75 per cent. J. B. TONKIN.

FREAKS OF THE FICKLE GODDESS IN MINING.—Recently Meers, Ayer & Co. have struck the blue gravel obannel on Mooney Flat in Nevada county and found it to pay from \$20 to \$50 a ton. They sunk a shaft but 62 feet before coming upon the gravel, and have since sunk 10 feet, with no sign of bottom. Some years ago, a company of men in search of this same golden channel ran a tunnel of great length through very hard rock, at a cost of \$250,000, but in such a way as to almost strike it without touching upon it. They gave up in disgust, and now, after years have passed, come men who, after a few days' work, pop down into the ancient treasure-house amid the golden nuggets. There is added another to the thousand instances of the fickleness of the goddess of mining fortune in dispensing her favors.

The Deep Gold Placers of California.

NUMBER VII.

Written for the Press and Copyrighted 1890, by HENRY G. HARKS, F. G. S. A., F. G. S. J.

Bedrocks and Lavas.

The word "bedrock" was coined by the miners of California and applied to the rock on which the auriferous gravels lie as on a bed. There is nothing in the term that would indicate the nature, lithological or otherwise, of the rocks themselves. They are very interesting and well worthy of careful study by the miner and geologist, for they are but little known.

The bedrocks differ with geological position, but there is a remarkable similarity in those on which the deep placers lie. They are argillaceous schists alternating with slates and bornblende schists, and are sedimentary without reasonable doubt. They were deposited in the bed of an ocean where they lay until elevated by the upheaval which produced the Sierra Nevada, and being fissured and slaty, very many quartz veins were subsequently formed, from which gold is seldom absent.

The bedrocks in some hydraulic mines do not generally differ from those of the drift mines. At the Polar Star hydraulic mine in Placer county, it is seemingly sedimentary and highly metamorphic, having evidently been fine silt, and still shows obscure traces of stratification. At Chalk Bluff, also in Placer county, it is generally slate with upturned edges, the slaty cleavage being nearly vertical.

The Manzanita mine in the same county is an exception, the bedrock here being a decomposing granite; when first exposed in piling it was quite hard, but is now assuming the character of coarse granite sand. At the Milton hydraulic mine, slate is the prevailing bedrock, which is the case also at Sweetland Creek, where copper shales occur.

At Chalk Bluff there is a peculiarity seen which is somewhat noticeable elsewhere. The formation uncovered by washing is crumbling, or "slacking," as it is expressed by the miners—that is to say, the bedrocks and some of the boulders, which when first exposed were strongly coherent, have now fallen to powder or are so soft that they can be easily crushed by the hand.

At Gold Run in Placer county the bedrock is slaty, and in some parts shows a brecciated structure as if it had been plastic at some time like the serpentines. In the bedrock there are a multitude of very small quartz veins, and a conspicuous incrustation of alum forms on the rocky sides of tunnels and open cuts.

There is a great similarity between the soft auriferous matter in the Edman mine, Plumas county, and the bedrock in the tunnels at Sawpit. The Edman seems to be a tilted glacial deposit through which fine gold is very evenly distributed.

There are a number of abandoned hydraulic mines near Laporte and Gibsonville, Plumas county, in which the bedrock is exposed and may be very conveniently studied.

At the Dutch hydraulic mine near Laporte, the bedrock is sedimentary and in the nature of a horse. It is called by the miners a false bedrock.

Sometimes a portion of the loose gravel in a hydraulic mine at some distance above the true bedrock becomes cemented, a condition which may for a time deceive the miners. An example of this nature may be observed at the Malakoff mine in Nevada county, which was exposed to be the true bedrock until by accident it was discovered that gravel lay beneath; the conglomerate being blasted away, the lower gravel was piped out. On the false as well as on the true bedrock, gold was collected.

In primitive times a large erratic boulder lying imbedded near the surface sometime became to the local prospector a bedrock to which he sank his shallow shaft, and having drifted a short distance without finding the expected gold, departed without knowing the limited area which to him was a bedrock in the true miner's sense. In hydraulic mining on a large scale in modern times, many instances of this nature have been revealed.

The channel at Laporte, from which millions of dollars worth of gold has been taken, is wholly exposed and is an interesting study. It was at this locality that certain features were observed that confirmed my present opinion. The bedrock here is probably sedimentary and metamorphic, some of the slaty rocks are blue in color, being evidently indurated mud or silt, a large portion is highly ferruginous and strangely resembles the so-called "brickbat" of the Georgia gold miners, described in detail in the Fifth Annual Report of the State Mineralogist of California, fol. 141. The lowest depression of the channel, which is too irregular to be the bed of a river, is 75 feet below the plateau on which the town stands.

Examination of Bedrocks.

No. 1.—Argillaceous shale from the Edman mine, Plumas county. Color, gray; when held in certain lights has a semi-metallic luster, slaty cleavage; nearly at right angles with stratification; specific gravity, 1.552; hardness, 5; contains silica, 80.8; alumina, 6.2; oxide of iron, 6.2; in a closed tube gives water; infusible; does not change color with heat; emits a strong argillaceous odor; fine grained, somewhat micaceous, semi-vitreous, homogeneous, almost exactly resembling slates from the bed-

rock at Laporte. This is the typical soft bedrock of the deep placers of Plumas and Sierra counties.

No. 2.—Hornblende schist, Laporte. Color nearly black, micaceous, with glimmering luster; interstratified with very thin seams of quartz; specific gravity, 3.153; streak, light gray; hardness, 5.5; under the microscope shows imbedded glassy crystals seemingly feldspar; this gives the rock the character of a diorite. No sections were made; contains silica, 47.1; alumina, 10.4; oxide of iron, large. This rock does not seem very abundant.

No. 3.—Slaty rock breaking with rough angular fracture, appearing like a slaty serpentine. It occurs in considerable quantities in the banks of Wallis creek, Plumas county.

No. 4.—Serpentine, flank of Mt. Fillmore. It does not differ from the common serpentine so abundant in many parts of the State.

The nature of the bedrocks gives local character to the obannel fillings or boulder-clay; for even in California, where they are similar and all prolific in gold, the obannels in each locality differ among themselves.

From Gibsonville to Nelson Point in Plumas county, the road cutting exposes the slaty bedrock in many places, intersecting it at all angles. A study of the rocks along this grade is very interesting, and a very significant fact may be observed which throws light on the origin of gold in the placers. It may be seen that the slates are intersected by innumerable quartz veins from fractions of an inch to many feet in thickness, and they are all more or less auriferous. The rocks here referred to are all below the Gibsonville and Laporte channels. There is no doubt in my mind that these quartz veins are the sources of most of the placer gold in the deep placers under the lava, as well as that which was taken out of the bed of Nelson creek and at Richmond Hill.

"Both slate and shale are no doubt sedimentary mud or silt, which from grestage have become indurated and in most part were formed at the bottom of the sea. The fossils often contained in them are conclusive evidence of this. Natural forces have bent and warped the strata until they have become plicated like the leaves of a book, or a pile of writing-paper pressed laterally. In slate quarries, lines of stratification of various colors may be seen marking the different periods of deposit; the lines of cleavage lie generally in a certain direction, which is called the strike; the inclination is the dip. These were all laid in horizontal strata. Slate is altered shale, which, instead of cleaving in the plane of stratification, now divides at an angle with the natural deposition, called cleavage planes. The line of strike in the slate is almost invariably parallel to the trend of the mountains and the upheaval in the surrounding country, from which we may infer that some lateral pressure has bent the strata and caused at the same time the slaty cleavage.

"To prove this, Mr. Sorby of London made some interesting and conclusive experiments bearing on this subject. He subjected a portion of clay without cleavage or stratification to very great pressure. The original mass contained scales of oxide of iron, which were distributed throughout the clay without regularity. The clay was reduced by pressure to half its volume. The result of these experiments was the development of certain singular phenomena. The scales of iron oxide had arranged themselves in parallel lines, and a slaty cleavage was now apparent, the cleavage planes being at right angles with the pressure applied. Prof. Tyndall has shown that pure white wax can be made to cleave into parallel scales under sufficient pressure. Were these experiments not enough to prove that slate, unlike shale, has been under great pressure, other facts might be stated.

"In the Silurian slates of Europe the imbedded fossils are frequently distorted, and the elongation is always in the direction of the cleavage planes, showing that the movement of particles which caused the lamination was in the line of least resistance, or at right angles with the pressure. When there are no fossils present, small gravel and pebbles are found to be arranged like the iron scales in Mr. Sorby's experiment, with the longest axis in the direction of the dip. When neither fossils nor large particles are present, a thin slice placed under the microscope will show the finest particles and accidental scales of mica arranged in the same manner. It may be assumed that any fine-grained sedimentary rock submitted to sufficient pressure by the force of nature, will develop the same slaty structure." (21 Annual Report of State Mineralogist of California, Sacramento, 1881.)

Lavas.

Geologists make a distinction between eruptive or volcanic igneous lavas and the fissure subterranean or plutonic igneous lavas. The former is known to have been intensely hot, and fluid from that cause, but no one seems to have been bold enough to assume that the latter may have been plastic and semi-fluid from the presence of much water; in other words, that they are eruptive mud, and were never much hotter than boiling water. While I am not prepared to assert that this was the case in California, and that a deposit of this character covered and protected the deep placers, I shall lay before my readers certain facts for their consideration, leaving them to draw their own conclusions. A large portion of the United States is covered by lava sheets of this nature, far too extensive to be volcanic flows, and the absence of great volcanoes makes such an ori-

gin still more improbable. In Europe and Africa also, vast areas are known. But to confine ourselves to California, we find that our sheet lavas have peculiarities worthy of the careful attention and study of geologists.

It is well known that certain volcanoes sometimes eject great quantities of liquid mud. The crater of "Aguila" in Guatemala has never been known to pour forth anything but mud and water. In 1817, the volcano of Idjen in Java gave birth to an eruption of water and mud boiling hot and strongly acid. Geikie, one of the highest authorities on modern geological science, admits that "mud lavas or aqueous lavas in many respects behave like true lavas. This volcanic mud eventually consolidates into one of the numerous forms of tufa." A flowing mud lava, being largely composed of water, could in no sense be igneous. It is my opinion that many rocks classified as plutonic, are of this character.

"In 1698 the volcano of Cargnarszo, contiguous to and probably connected with Chimborazo, sank in and covered 50 square miles with mud. It is not in fact by burning lavas that the volcanoes of Peru and Quito exercise their ravages, but by torrents of mud and water; the mud when first ejected has the consistency of pap, but it speedily hardens, and occasionally contains so much combustible matter that the inhabitants make use of it for fuel." (New System of Geology, etc., by Andrew Ure, London, 1829.)

A remarkable circumstance bearing on this subject is recorded in a paper published in the quarterly journal of the Geological Society, February, 1890 by F. M. Corpi, entitled "The Catastrophe of Kantzorik, Armenia."

The author states that on the second of August, 1889, the village of Kantzorik was inundated by a flow of soft mud, resulting from the bursting of the Eastern Mountain. The village was buried and 136 villagers perished.

Mr. Corpi thus describes this singular deposit as seen by him:

"From this point to the foot of the Great Eastern Mountain (which is situated at the extremity of the valley in the direction from east to west), and for a distance of seven to eight kilometers and for a width varying between 100 and 300 meters according to the configuration of the ground, stretched like a vast, motionless river, a mass of solidified marly mud, the greater part of which was of a bluish-gray color, and the remainder of various other tints. This material, which, taking account of the superficial and the inclination of the flanks of the mountains and hills forming the valley, may be estimated approximately at more than 50,000,000 cubic meters, has the appearance of an undulating sheet."

Similar phenomena may have been common in past geological periods.

Aspelmen of diorite was sent to me some years ago from New Zealand, in which was imbedded a fossil shell. If this rock had been igneous plutonic as supposed, the presence of the fossil would seem impossible. The specimen is now in the cabinet of F. A. Kimball at National City in this State.

That the columnar structure generally thought to be peculiar to basalt is the result of desiccation, and that sedimentary deposits assume this form as far as conditions will admit, may be proved by riding over the smooth, treeless plains known as dry lakes, so common in the inland basins of California. It may be seen that the fissures caused by drying, nearly all form pentagons, and it requires only the exercise of imagination for the reader to believe himself crossing a plateau of basaltic columns extending downward indefinitely.

About a century ago geologists were divided as to the origin of the basalts, traps and other rocks. The result of my study of these in California convinces me that the question is still unsettled.

The controversy was between the Neptunists, followers of Werner, and the Volcanists, with Hutton as leader. Among other writers most interested, may be mentioned Playfair, Sir James Hall, Jameson, Murray, Hope, Seymore, Kirwan, Patrin, Dolomieu, Saussure, Brochant, Fajjas, Wallerius, Duhousson, Pinkerton, Ure and others. Fajjas, an ardent Volcanist, admitted that common trap was not of volcanic origin.

Dolomieu (quoted by Patrin) says: "There is such a vast number of Egyptian monuments in the Borgia Museum at Veletri that they are almost sufficient to constitute the whole Egyptian Lithology. Many are formed of stones which have the qualities attributed to basalt; not one is volcanic."

Nearly all German scientists in the time of Werner believed that trap rocks were formed by water.

"Basalt often repose immediately on coal at Meisener near Cassel. Now if this basalt was volcanic it must necessarily have produced the combustion of these beds of coal."

"The remains of vegetables and animals which are found in the trap rocks could not in like manner have resisted the volcanic heat without being destroyed." "Cavities filled with water, such as enhydriac agates found near Vicenza in Italy in secondary trap mountains, entirely destroy all supposition of a volcanic origin." (Brochant, quoted by Pinkerton.)

The following facts are well known to those familiar with the deep placers of California. Trees are found in the lava unburned, leaving the impression of the bark. Mr. A. B. Wood saw in the Mountain Gate drift mine, Damascus, 900 feet below the surface and 7000 feet in the tunnel, a piece of wood six or eight

inches in diameter, imbedded in the so-called lava, and it was not charred. Mr. Goodyear saw a fossil tree standing vertically in gray cement. Many similar instances are known.

I have conversed with a number of gentlemen of large experience in mining the deep-drift placers, who were unanimous in denying any indication of metamorphism at the line of contact between the loose gravels and the superincumbent lava. On making an uprise, when the lava was reached, it was easy to pick down the gravel, leaving a smooth ceiling or roof above.

As additional evidence that the lava is not volcanic, I have the word of the same gentlemen that in drifting they sometimes come to a wall of lava, so called, to which the gravel extends and a slight upward bending of the bedrock is observed. At the line of contact no change in the condition of the gravel is ever seen, which would certainly have been the case had the lava been igneous. Mr. J. B. Thomas once sunk a prospecting shaft alongside one of these dykes expecting to find the mass resting on a bedrock or on gravel, but such was not the case although his explorations reached far below the channel bedrock.

The possibility of an eruption of mud from a local volcanic mountain being admitted, it is but a step to concede one of far greater magnitude issuing from fissures of the crust of a contracting earth.

Several varieties of lava occur in the region under consideration. One black scoriae and crystalline (1), rich in olivine and without doubt igneous volcanic, but the quantity is very small and the localities few. The so-called lava onp (2), including the Gibsonville ridge, is gray, porphyritic, non-crystalline or crypto-crystalline, and resembles andesite from Colorado. This lava covers the country far and wide. It forms table mountains and is the lava under which the deep placers lie, so often referred to in this paper. Another variety (3) is very common and widespread at lower altitudes. It is called "white lava" by the miners, and is quite extensively used as a building stone at Mokelumne Hill in Calaveras county, at St. Helena in Napa county and elsewhere. It is generally considered a volcanic ash. It is a very good and convenient building material, easily cut, resistant to fire, as experienced at Mokelumne Hill during a conflagration which occurred some time since.

Another variety (4) occurs in quantity near Messenger's House in Calaveras county, and elsewhere. After examining this, it is not difficult to believe the statement that the Indians used to make mortars of this formation and were not disappointed in their expectation that the vessels would harden with time and exposure. The following is my examination of the varieties referred to above:

No. 1.—Several specimens examined chemically and microscopically were from Sawpit and Spanish Peak, Plumas county. To the eye they seemed homogeneous, dense, fracture conchoidal; if closely examined, much olivine was seen in some portions; a thin section under the microscope revealed the true crystalline structure of basalt. This specimen was very similar to the dense basalt of the Sandwich islands, of which the ancient inhabitants fashioned their rude stone axes, with samples of which I have compared it.

No. 2.—(A) Porphyritic specimens from near Gibsonville. Occurs near road between Lyorte and Gibsonville; resembles andesite; color of matrix, bluish gray; obsidian crystals creamy.

THE VINEYARD IN AUTUMN—FROM GRAPE TO RAISIN IN THE SUNSHINE.

Singular Geological Phenomenon.

On J. C. Hartman's ranch, two and a half miles north of town, a singular geological phenomenon has occurred. About three acres of land suddenly sank about 50 feet, leaving perpendicular walls on three sides, or in the shape of a semi-circle. The horizontal strata, consisting of indurated clays and friable sandstone, are exposed below the soil, presenting a beautiful appearance. While there was a gradual slope to the west, yet the depression does not partake of the nature of a slide but is a vertical sinking of the earth. The elevation is 1150 feet above the sea level and the land has been tilled for several years.

In this range of hills, which culminates in the Sulphur range of mountains, are many indications of bituminous matter and of sulphur. This region, especially a little farther north, is subject to solfatara, some of which are still in operation, while others have become extinct. In these the bituminous matter at some distance below the surface is finally burned out, leaving a cavity of greater or lesser extent, and not being able to support the superincumbent weight, it is liable to sink from the top. This may account for the sinking of the land on Mr. Hartman's ranch. In Adams' canyon a living solfatara may be seen, and one near Rincon. Both emit heat and steam and sulphurous fumes. An extinct solfatara may be seen on the mountain-side, a mile southeast of Santa Paula. The earth has sunk, leaving walls of variegated sandstone, which may be seen several miles distant.—*Ventura Free Press.*

SIX-MILE CANYON.—The *Virginia Enterprise* says: If any one has ore to crush he can go down in the canyon and readily engage

nearly all the stamps that are there. They are nearly all idle, and those who have stamps have no use for them over four or five days each month. Tom Hully has two five-stamp mills in the canyon, but he is not crushing. He has lately purchased the California mill tailings, paying \$30,000 for about 5000 tons. He will first run them through for the quicksilver, and he will then let the action of the air oxidize them for some time, and then run them through again. Pfeifer, who owns the lowest mill in the canyon, is building an over-shot wheel, because he finds the burdy-gurdy wheel is too expensive. He has two stamps, works his own tailings and does a little custom crushing. Jennings's, Boswell's and Lonkey's mills are run on tailings. Fisher's mill of four stamps runs a little rock and tailings. Johnson's and Bruce's mills have one pan each and no stamps. Bowie's mill has two stamps and two pans. It can crush but 1000 pounds of ore to the stamp in 24 hours. Nearly all the millmen own strings of sluices, and they do their own sweeping and all their other work.

Grapes for Raisins.

The California raisin industry is one of our most profitable, promising and rapidly extending specialties. Not only so, but the raisin is winning wide reputation for our State in distant parts, and our raisin districts, especially in the San Joaquin valley, are enjoying a good share of the influx of population. A single branch of production which made an outturn last year of one and a quarter million 20 pound boxes, or in round numbers, 25,000,000 pounds of dried fruit, and which bids fair to increase this amount this year possibly 33 per cent, is naturally attract-

ing much attention. This interest is also stimulated, no doubt, by the fact that in spite of this product and the foreign product as well, there is this year a great shortage in the world's supply of raisins. The outlook is that those who have been planting raisins so resolutely and confidently during the last few years will find themselves luxuriating in generous returns this year if no unfavorable influence prevents the realization of present crop promise.

In view of the popularity of the raisin interest, we have thought that we could not better please our readers in distant parts of the world and in parts of our own coast where raisins are not now produced, than by selecting two pictures which illustrate two stages in the year's progress in a California raisin vineyard. One is a winter view in which are seen the vines in their regular rows correctly aligned from any point of view. The foliage has fallen, the canes have been pruned back to a few buds and nothing appears to the casual observer but gnarly stumps with crests of pruned spurs, the old dark black, ragged, uninviting; the ground covered with rubbish of dead leaves and husks and clods. Such is the aspect of a vineyard until the winter rains start the growth of verdure along the rows; then follow the plowing and harrowing, or cultivating, and the sorry vine stumps are surrounded by an even surface of well-pulverized soil; soon the vine feels the warmth of the spring sunshine, the foliage starts, the gnarly, spindly head of the vine is hidden beneath a tuft of crisp, delicate leaves; then if frosts forbear, or shoot the canes with twining tendrils, the vine stump is lost to sight, the field becomes an expanse of beautiful green mounds. Back and forth go the cultivators, each time the pathway of brown soil becoming narrower until at last vine links tendril with vine, and the field is a sea of green; vine stump, brown soil, everything is concealed beneath the dense mantle of verdure. Such is the California vineyard at midsummer. In young vineyards there will be protruding stakes and bare patches of soil, but in the old vineyards there is neither sign of stake nor trellis; the vine pruned to support its own weight, except such as it can distribute over the surrounding soil, needs no support. There is nothing handsomer in the midsummer landscape than the green of the vineyard contrasting with the browns and yellows of the grain fields, or the unimproved hillsides. Orchard is green as well, but the vine has a density of foliage and a uniform verdure which can be selected as far as the eye can perceive.

As the summer shades into autumn, the scenes in the vineyard partake more of the character shown in our second engraving. The heavy clusters of ripe grapes are gathered, spread upon wooden trays and exposed to the clear sunshine and warm dry night-air of the interior valleys of California. As the available space between the vines does not always accommodate the fruit, all surrounding spaces are employed. In the engraving the avenues around the vines are spread with trays and the banks of the irrigation ditch are also covered,

WINTER SCENE IN A RIVERSIDE VINEYARD—PRUNING AND CULTIVATING.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

GRAVEL.—Calaveras *Chronicle*, May 10: With the few days of fair weather, giving the roads a chance to dry a little and become passable, movements began in mining operations, and while not yet fully awakened, promise to be so when the weather is fairly settled and the condition of the highways permit ordinarily easy travel. Mr. Geo. R. Tuttle has begun active operations in prospecting for blue lead gravel in Chili gulch, this week. Water-power will be put on and a 6-foot Donnelly wheel will be used on a 30-inch diameter hoist. Mr. Tuttle is putting up a good rig and so arranging it that in case pay dirt is not found he can easily and cheaply remove to some other prospect. From all that can be learned, however, he is more than likely to strike it rich in his present location. McSorley & Co.'s gravel mine, in Chili gulch, recently bonded, is, we understand, in full blast.

GOLD CLIFF.—*Mt. Echo*, May 8: Mr. Garrard, superintendent of the Gold Cliff mine, finished the laying of the water-pipe this week and turned the water on the wheel which runs the Tulloch concentrators. They worked splendidly and far exceeded the most sanguine expectations.

El Dorado.

LOTUS.—Georgetown *Gazette*, May 8: The Wagner Bros. have been engaged the past two weeks in moving the old Pascal mill from Granite Hill to their claim west of here. It will be rebuilt and put in operation at once. Their mine from all appearances has turned out to be a good one, and to save all the yellow metal the young men have invested in a mill and hoisting works complete. This will be a fine thing for our town, and we wish them success. The old Stuckslager or Sam Sims mine is soon to start up also. It is owned by a S. F. firm, and the intention is to erect hoisting works and a small mill of some kind. The foreman, a Mr. Dennison of the old Taylor mine, has the work in charge, and will commence operations as soon as possible. Both of these are pocket mines, with some gold in the hanging and foot walls. By having mills all of the gold is saved and there is no loss whatever.

OAKLAND MINE.—*Mt. Democrat*, May 10: J. S. Raw of the Oakland mine returned from the East this week. Since the return of Mr. Raw the pumps have been set at work on the mine, and the shaft will be cleaned out, when the company will let contracts to sink a fine shaft 300 feet below the present lowest point reached.

MACHINERY.—M. J. Ryan of the Oak Consolidated mine near Grizzly Flat has had teams busy this week hauling up the machinery that is to be put up at the mine. The present owners recently paid over the last of the purchase-money, and having satisfied themselves that they have a good mine will push things.

SLATE.—Mr. Bine, superintendent of the California slate quarries, informs us that the increasing demand for slate keeps his yard cleaned out, with orders far ahead of the supply. To meet the exigencies of the occasion, his company has under contemplation the construction of an automatic hoist that will elevate the slate from the quarries to the top of the hill back of Luce's ranch, from which point to town an easy grade for hauling can be secured along the county road.

Inyo.

ACROSS THE RIDGE.—*Register*, May 8: The 40-ton furnace destined for Sylvania is soon to be put in place. It will be located within a few hundred feet of the Esmeralda line. About 60 men are now at work there, and more going. No work will be done in the mine until the immense amount of ore now out is disposed of. At Palmetto, the mill has been hung up on account of snow, but started Tuesday. At Pigeon Springs, Murphy is working the Buster mine. He goes below in a few days to purchase a Huntington roller-mill, to take the place of the two steam arastras heretofore used. Murphy will work over the tailings from the arastras, and afterward turn the mill loose on the large quantity of ore now on the dump of the mine. At Gold Mountain, Fred Vollmer and Pete Kaiser are doing effective work. Our informant says that from a shipment of 2½ tons of rich ore recently shipped by them they received a net cash return of \$3400.

FISH SPRINGS.—The mines in the hills just south of Fish Springs appear to be on permanent paying ledges of low-grade ore. Jones and Elias are now working the Pontas Negros mine, located about a half-mile west of the county road, and a mile and a half from the railroad. The shaft is now down 18 feet; its owners propose to sink 100 feet farther, and if justified by the prospect, put up a mill. The ores carry silver and gold, and are being taken from a 32-inch ore streak in a six-foot ledge. The first assays from this claim were made from rock found two feet under ground, and these tests gave a value of 25 ounces silver. At the present depth assays average about 38 ounces, showing a steady increase with the depth. McCarthy et als. are working an 18-foot ledge of low-grade gold ore. A run and cleanup has just been made of 40 tons of ore from their mine. Commati has been doing well with his mine and arastra.

Mariposa.

THE HART MINE.—*Mariposa Gazette*, May 10: On Thursday we were shown some very rich samples of gold quartz from the present workings of the once famous Sebastopol gold mine, about five miles south of Mariposa. The mine was bonded last fall by Messrs. Ridgway & Hay, since which a shaft 70 feet deep has been sunk, which has shown a well-defined ledge estimated from 18 inches to 2 feet, and about \$40 milling rock, with very rich strata, indicating that there are some rich pockets not far away, and at 100 feet the owners expect to run levels and crosscuts and tap the pay chute left by Mr. Streeter at the time his lease expired. It is a well-known fact in Mariposa that Mr. Streeter, the Lind Bros., Lewis, Anderson, Snow and others have taken out large amounts of coin from this mine in former years, estimated at least \$200,000, and, strange as it may appear, all this was from rock rich enough to crush with a hand mortar and everything else went into the dump pile. The deepest work done in the past was

about 90 feet and it is demonstrated that the deeper the development goes the better it will be. It is expected that a rich strike will be made in the near future, and we hope soon to see this mine a good producer again. A company has just been organized with a board of directors who are thoroughly conversant with this mine, and it intends to push the work as fast as possible, and soon to put up a mill to crush the ore, which is not rich enough to crush with a hand mortar.

THE WHITLOCK MINES.—Jack Farrens brought in some quartz from his claim on Whitlocks the other day, which showed free gold well distributed throughout, and loose in a red ochre formation which was very rich. Mr. Farrens has good reasons for believing that his is one of the many good mines now being prospected on Whitlocks. There is every reason to assure a lively camp in the near future for that locality, as the mines there are looking up well without exception, and the more they are worked the better they prove to be. A few of the more promising ones are the Alabama, Helm's, Duzenberg, Ellingham & Grove's and Heisser & Perego's. All the mines on Whitlock's and Sherlock's creeks are known to be rich, deep mines that only require development to prove their endless value.

Nevada.

THE IDAHO'S NEW ORE BODY.—*Grass Valley Union*, May 10: The new ore body recently struck on the 17 level of the Idaho mine, at a vertical depth of 1900 feet, continues to have all the appearance of a genuine bonanza. This ore body was struck at a distance of 200 feet from the shaft in driving the drift eastwardly to the regular pay chute, which would not have been reached in a less distance than 1000 feet, judging from the dip of the chute as found in the 16 level. The new ore is of an entirely different quality from that found in the regular pay-chute, being highly mineralized, some of it going as high as 15 per cent in sulphurets, and is much darker in color, and the lode extraordinary in size, and the space between the walls at the widest part yet found is 20 feet. The quartz and sulphurets are rich in gold, and even the cab prospects in gold. The drift has now been carried into the ore body a distance of 30 feet, and although this is not far enough to determine whether the ore body is going to be continuous, there are no indications of it giving out, or the lode narrowing its width. The entire face of the ore as exposed prospects well in gold. Although no figures are given out as to the yield per ton by mill process, the statement is made that the ore is as rich as any that has ever been found in the mine, and when it is considered that the regular pay chute within the limits of the Idaho boundaries has yielded over \$11,000,000, and the same chute in the Eureka location gave a yield to the company of over \$3,500,000, it may be imagined that the present find is showing signs of being very important. It is too soon yet to define the direction of the strike of the new ore body, as it was first struck in the floor of the drift, which made it appear as if that was the top of it, but it has since filled the face of the drift and has widened as the drifting has progressed. There were no indications of it on the 16 level, and it may be that it extends downward, going both east and west, but as to the latter direction this cannot well be demonstrated until the shaft is carried down to another level. If the ore holds as now to the eastern boundary of the location the distance will be 1200 feet or more, which will insure an enormous yield of the precious metal, and if it extends downward, as it undoubtedly will, in that case it would be difficult to place an estimate on the value of such a magnificent ore body. As heretofore remarked, this discovery is of exceeding interest in showing the possibilities of deep mining in this district, and will place the quartz-mining industry on a safer and more enduring basis than ever before.

MILLING THE WASTE.—*Transcript*, May 9: At the Pittsburg mine of this district the rock of the old waste dump is being put through the mill at a cost of from 70 cents to a dollar a ton, and from \$3 to \$4 a ton, besides the sulphurets, is being realized, giving enough gold to pay for all the extensive prospecting operations being carried on in the lower workings. The Empire Mining Co. at Grass Valley is also working up its waste with profitable results. Tributaries while working in these mines put aside the lowest grade ore because they did not believe it would pay them to hire it crushed.

Placer.

THE DRUMMOND MINE.—*Herald*, May 10: Wm. Werry, superintendent of the Drummond quartz mine, located a few miles south of Iowa Hill, was in Auburn last Saturday, and from him we learn that work on the mine is progressing satisfactorily, and that the developments are very encouraging. The lower or new tunnel only lacked 25 feet of being into the ledge, and by the time that is in the second roller-mill will be ready to run, after which they will be able to crush from 35 to 40 tons of ore a day. At present they are extracting ore from the old or upper tunnel and crushing on an average a little less than 20 tons a day. The vein is good and strong, averaging four feet, and is all milling ore, and yields right along from \$6 to \$7 per ton. This mine is the property of C. F. Reed of Auburn, and from present indications promises to prove very valuable.

San Diego.

THE NEW MINING COMPANY.—*Julian Sentinel*, May 9: We are enabled to give our anxious readers a partial outline of the work that is contemplated by the owners of the Cincinnati Belle and Gold King and Queen group of mines, who have lately visited the camp for the purpose of inspecting these properties and arranging for the proper development of the same. The true merit and magnitude of the property they found had been underestimated, and that all previous plans of operating the property were entirely too limited. Hence a new and more expensive mode of operations has been adopted. The entire company, including Messrs. Cushman and Rhorer of St. Louis, resolved to surrender their present charter, as it exists under the laws of an Eastern State, and incorporate under the laws of California, increasing the capital stock to \$1,500,000. Col. T. W. Brooks, acting agent of the company, arrived last week and is now busy rearranging the former works, and we learn from him that estimates of a 20-stamp mill are before the builders of San Diego and San Francisco, preparatory to erecting the same on the company's property at an early date. He also informs us that an entire change of operating the property will be made. The present working ore shafts

of the Cincinnati Belle, King and Queen will be abandoned, except as an air shaft, and in their stead will be sunk large and permanent shafts at a more practical point. There will be a temporary suspension of work on the Cincinnati Belle until such time as the new hoist arrives, the perfecting of plans and the many changes that are necessary. This is the first move of grand proportions that has been made in this camp (harring the Stonewall) for many years, and the benefits to be derived from such extensive operations are many.

Shasta.

OLD DIGGINGS DISTRICT.—*Redding Free Press*, May 10: The Central mine, after being idle nearly two years, has made a move in the right direction. Operations were resumed May 1st. This will be a good move for all Shasta county. Mr. W. L. Sharp of Shasta is foreman of the mine. The mines of the Old Diggings are on their way to prosperity and the outlook was never more encouraging. Notably is this the case with the Hart & Fleming mine, which has attained a greater depth than any other mine in the district. The deeper they go down the richer it gets. Mr. Champion has bought a mine at Buckeye and christened it "The Lexington." He has also bought an engine and steam pump and will proceed at once to develop the same.

FROM DOG CREEK.—*Courier*, May 10: L. O. Enochs was down from Dog creek this week, and has been at work in the mines all winter. His report is favorable, although the miners had to contend with unusual inclemencies of weather. The McCourt boys, Randalls and Donahoe, have a claim on the headwaters of Dog creek. They have a tunnel in 230 feet, and are getting close to the ledge, that crops out fine and strong on the surface, and prospects in a manner to excite a forty-miner. Situated just south of this is the bonanza claim known as the Trinity claim of Coyle & Carter, which is being developed gradually. Near to and adjoining the Trinity mine, L. O. Enochs and Tom Luddy have a mine known as the Central, and have been hard at work to develop it for several months. Their tunnel is now in the hill over 100 feet, and 70 or 80 feet more tunnel will certainly tap the ledge, and the surface croppings are such as to indicate that at a greater depth the "golden chest" will be found. All the miners on Dog creek are doing pretty well considering the hard winter, and the placers will show good returns this summer and fall.

QUARTZ.—Ed Taylor, our roadmaster, has owned a quartz ledge at Hogtown near the Council House, and suburb of Shasta, for some time. Recently Ed concluded to see what the quartz was worth on working test. He took unselected 6½ tons and sent it unsorted, to Engram & Wright's arastra, where it was ground up. As a result of the cleanup Taylor has a specimen in the shape of 5½ ounces of pure gold retort. The neighborhood of 15 per cent is pretty good for rock taken just as it came from the ledge.

Tuolumne.

TO BE REOPENED.—*Tuolumne Independent*, May 8: The old Colby claim is to be reopened by Messrs. D. Oliver, J. P. Dart, A. P. Johnson and M. Kelley, work having been commenced last Monday. The old cut and tunnel which had caved in during the past winter is being cleaned out, and we are informed that a steam engine will be put up soon for the better development of the mine. The gentlemen interested are enterprising, experienced mining men.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Chronicle*, May 10: On the 630 level a southwest drift is advanced 535 feet from the shaft station. Formation, clay and porphyry carrying water.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 370 feet, continuing in porphyry.

MEXICAN.—On the 1465 level west crosscut No. 4, 100 feet south of No. 3, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 241 feet, continuing in porphyry carrying lines of quartz.

OHIO.—On the 1300 level in working south-westerly from the top of the raise carried up 28 feet above the south drift from the end of the east crosscut from the shaft station, following the ore streak found in the raise downward, 65 tons of ore were extracted and raised to the surface, the average assay value of which is \$27.50 per ton.

CON. CALIFORNIA & VIRGINIA.—The 1300, 1500 and 1600 levels continue to yield the usual quantity of ore. Shipped to the Morgan mill 1064 tons and 1300 pounds of ore and to the Eureka 1603 tons and 660 pounds; battery sample assays showing an average value of \$22.50 per ton [2735 tons milled]. Bullion valued at \$19,596.59 shipped to the Carson Mint, and to San Francisco, \$35,956.77.

BEST & BELCHER.—On the 1000 level the joint west crosscut is cleaned out and repaired 90 feet.

GOULD & CURRY.—On the 400 level the northwest drift from west crosscut No. 1 is extended 34 feet. Formation, hard porphyry.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels. In the 550 level north line west crosscut are cutting out a station preparatory to sinking on the ore developed there.

NORTH OCCIDENTAL.—Work confined to repairs. **NORTHWESTERN CON.**—Sinking shaft below the 100 level. Bottom in quartz.

ANDES.—A 420 level west crosscut 160 feet north of the shaft is in 10 feet, showing clay and quartz seams in the face. The 350 level west crosscut is extended 220 feet, the face in porphyry.

SAVAGE.—Shipped 420 tons of ore, showing an average value of \$23.25 by battery sample assays.

HALE & NORCROSS.—A 500 level east crosscut is advanced 144 feet, and continues in porphyry and quartz, giving low assays. Shipped 1050 tons of ore during the week, showing an average value of \$19.75 per ton by battery sample assays.

WARD COMBINATION SHAFT.—The 1800 level east drift is out 356 feet; the face continues in porphyry.

CHOLLAR.—The south drift, following the ore out in the 750 level east crosscut, 80 feet south of the north line, is out 40 feet, the face in quartz, car samples assaying from \$30 per ton. East crosscut No. 1, 280 feet south of the north line, is in 280

feet, the face in porphyry. East crosscut No. 2 is in 12 feet in quartz, car samples assaying from \$20 to \$25 per ton. On the 930 level the north lateral drift is out 635 feet, the face in porphyry. Extracted 451 tons of ore, battery sample assays showing a value of \$23 per ton.

POTOMAC.—On the 930 level the winze is down 98 feet. The bottom is in clay with streaks of quartz assaying from \$4 to \$10 per ton. The raise above that level is up 123 feet. The roof is in porphyry.

ALPHA.—The 600 level east crosscut is in 62 feet and continues in porphyry. The 600 level south drift is out 53 feet, the face in clay and porphyry.

EXCHEQUER.—The 600 level north drift is out 271 feet, and continues in quartz and porphyry.

CON. NEW YORK.—The 650 level west drift continues in low-grade quartz. The 960 level south drift is in low-grade quartz.

SCORPION.—The southwest drift from the 630 level shaft station is advanced 330 feet and continues in porphyry.

IMPERIAL.—The joint Challenge-Confidence 800 level north drift is out 160 feet from the north line of the South Challenge; the face continues in porphyry.

YELLOW JACKET.—Shipped 490 tons of ore showing average assay value of \$22.25 by battery sample assays.

KENTUCK.—The winze below the 950 level continues in ore.

CROWN POINT.—Shipped during the week 791 tons of ore, showing an average value of \$22.48 per ton by pulp assays. A raise above the 400 level has connected with the 350 level stopes.

CONFIDENCE AND CHALLENGE.—The raise above the 300 level is up 73 feet, the top in low-grade quartz. The joint Imperial 800 level north drift is out 196 feet, the face in quartz.

BELCHER.—The 200 level south drift is out 295 feet and continues in low-grade quartz. The 300 level west crosscut is in 105 feet, the face in porphyry. The 850 level joint east crosscut is out 402 feet, the face in soft porphyry.

SILVER HILL.—The 260 level northeast crosscut from the northwest drift continues in clay and porphyry. The 160 level south drift continues in porphyry.

SEG. BELCHER.—The 850 level Belcher joint east crosscut is in 402 feet, the face in soft porphyry.

JUSTICE.—During the week crushed 190 tons of ore showing a value of \$26.97 per ton by battery sample assays. The raise above the 622 level continues in low-grade ore.

ALTA.—The ore output this week was 315 tons, showing an average assay value of \$23.75 per ton by pulp assays.

OVERMAN.—Shipped 220 tons of ore during the week showing an average value of \$18.75 per ton by battery sample assays. The northwest drift continues in low-grade quartz.

Columbus District.

CANDELARIA.—Cor. Reese River *Reveille*, May 8: This is a fine place for a mining town. On the northeast it is well protected by a high range of hills where the mines are situated and all visible from the town. On the southwest is a gradual grade into the valley, and several roads come in from this direction. There is no timber for many miles. The main street for business is a fine wide street, three blocks on each side, and the buildings are in close connection with each other and most of the business places have fine shade trees in front. The population is about 300 or more. There are employed in the mines, at present, about 60 men. In the Mount Diablo and Columbus several men were discharged a few days ago, and none have been put to work since. So much for the boom. There are a few men working in the Holmes mine. They are not shipping any ore to the mill, which is undergoing repairs. It will be months before it will be in operation. There are many men idle here who have worked in these mines for years, some of whom have been out of work for many months. The mill at Sodaville is to be put in order to work the ores from this place. It is 22 miles from here, and the railroad takes the ore there in bulk.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, May 9: Following are the number of tons of ore shipped from the mines of this district to the Eureka Co. reduction works during the week: From the Dunderberg mine, 185½ tons; Lord Byron, 11 tons; Oriental and Belmont, 3 tons; Silver Lick, 20½ tons; Idaho, 6½ tons, and Mineral Hill, 1 tons. The E. & P. R. Co. shipped 495 tons of ore to Salt Lake during the week from the Diamond, Bullwhacker, Colorado, Richmond and Jackson mines. The ore shipments by railroad are rapidly increasing, over 600 tons having already been transported out of the camp this month. Teams were sent out from here a few days ago after ore from Morey and Hamilton. It is by no means improbable that if the transportation of ore over the E. & P. railroad continues to increase, a daily train will be necessary.

ON STRIKE.—The tributaries in the Richmond mine are on a strike. They demand 60 per cent instead of what they have been receiving. Only two men are at work in the mine.

Jackrabbit District.

DAY.—*Pioche Record*, May 3: The Yuba Co. is sending a force of miners to its Day mine at Jackrabbit and several large teams have been engaged to haul the ore to the furnace.

Tuscarora District.

NEVADA QUEEN.—*Times-Review*, May 9: North gangway from 600-foot level station of North Belle Isle, has been advanced 22 feet.

NAVAJO.—The crosscut from the north gangway 350 foot level, extended 8 feet. Rock very hard.

GRAND PRIZE.—400-foot level: East drift on the north vein extended 11 feet, face being all in vein matter. Face of west crosscut from south drift has been advanced 8 feet, cutting seams of quartz. Work has been suspended on the 500-foot level.

BELLE ISLE.—No. 1 north drift from Navajo line crosscut, 250-foot level, extended 14 feet. South drift at the north end, same level, extended 7 feet, showing some good ore. South drift from the No. 2 crosscut, 350-foot level, extended 13 feet; total ledge 58 feet. The face is now in quartz.

NORTH BELLE ISLE.—North gangway, 600-foot level, has been extended 22 feet. The face is in large blocky ground showing faces of spar and iron. West crosscut, same level, is in 58 feet, showing vein matter most of the distance.

NORTH COMMONWEALTH.—Second level: Joint

crosscut has advanced 12 feet, cutting seams of spar. No. 1 south drift extended 5 feet. Chute has been put up in No. 1 upraise, and work resumed in the raise. No. 2 south drift has been started 100 feet east of No. 1. It was started on ore and looks favorable.

COMMONWEALTH.—First level: East drift on Dolan vein extended 3 feet, total 200 feet. The ore in face of drift is small, and work has been suspended until crosscuts can be run to prospect the vein; crosscuts now in 20 feet. No. 2 upraise from joint crosscut extended upward 26 feet in vein formation. Two hundred and eighty tons of ore have been sent to the concentrator; 105 tons concentrates, dry weight, on hand.

DEL MONTE has sent 250 tons concentrating ore to the concentrator.

Tybo District.

TO PURCHASE.—Belmont *Courier*, May 5: It is said that capitalists will soon purchase the 2-G and Dimick mining properties at Tybo. With the judicious expenditure of money these properties can be made in pay handsomely, as there is plenty of good ore in sight in the 2-G and Alta mines. We hope to soon see Tybo a prosperous and lively mining camp again.

Yellow Pine District.

A LEAD MINE.—Pioche *Record*, May 3: Dick Huddleston having spent the winter months in prospecting through the southern section of the county, is sanguine of having made some valuable locations, among which may be mentioned the old Potosi mine in Timber mountain. Dick's copartners in the claim are Chas. Lytle, Geo. Warren, E. A. Shear, Oliver Rose and J. L. Hayes. The mine was located a good many years ago and was worked at various times by different parties. The mine is a little mountain of almost pure lead, but as it carries little silver it will not pay to ship any distance. The advent of a railroad through that section, however, will make it one of the greatest bullion-producers on the coast. The ore on the dumps is variously estimated at from 200,000 to 300,000 tons.

ARIZONA.

ORE.—Mohave *Miner*, May 10: F. F. Brawn has sent several sacks of ore to the Kingman Sampling Works, for sampling from a new strike in the Gold Basin. J. H. Farlee has high hope that he has struck an ore-bearing ledge in the Grand Canyon, near Diamond Creek. J. D. Smiley came in on Wednesday from his General Harrison mine in Todd Basin. The main tunnel is in 140 feet, and the ore is looking well. H. H. Thomas has twelve men at work on the Brown mine, at Stockton Hill. This property is proving better than ever anticipated. A boarding-house has been erected on the mine. The following lots of ore have been received at the Kingman Sampling Works during the week: Unclapper & Finegan, from the Homestake mine, at Mineral Park, 18 or 20 tons; E. F. Thompson, from the Empire, 15 tons; J. K. Mackenzie, from the Cupel, 30 tons; Rogers & Canyons, from the Tintic, about one carload; H. S. Thomas and J. A. Platt, from the Brown, Stockton Hill, 23 tons. A number of smaller lots were run through the Sampling Works. The tunnel connection with the main workings of the Little Boy mine was made last week. A large body of water was in the mine, which suddenly pushed the three-foot wall of rock, which held it back, and which it was intended to drill, and let the water out slowly, and carried everything in the tunnel and at the mouth before it. Two men were in the tunnel at the time, and they had a narrow escape from drowning. Supt. Conard is delighted with the completion of the tunnel work.

COLORADO.

THE MONTE CRISTO.—Aspen *Times*, May 9: Col. Morgan, manager of the Monte Cristo, has made a contract with Hillery & Thomas to bring down from 10 to 20 tons of ore per day from the property. The mine, he says, now shows a solid breast of ore seven feet thick. An average sample taken Tuesday night ran 36.8 ounces silver and 26 per cent lead. The colonel believes that he can get it treated for \$3.50 per ton. This mineral was opened in drifting from the old Lake tunnel, and the discovery seems to bear out the theory that the contact there rapidly increases in value as it dips into the earth. The developments, however, are yet too young to base any estimates on.

THE ASPEN.—There has been some talk on the streets for a few days past of a lay-off on the Aspen mine, and some folks have found in the report an omen of evil. The fears of such are entirely groundless; the mine has not closed down, neither has it laid off any considerable number of men. It became necessary to reline the shaft, and this necessitated the temporary suspension of hoisting operations. The work will be finished in two or three days and regular shipments will be resumed.

DAKOTA.

CUSTER'S PEAK.—Deadwood *Pioneer*, May 6: Prospectors have found refractory ore similar to that of Ruby at the foot of Custer's Peak. The east side of the bottom of the mountain has been completely taken up by lectors.

RUBY.—This mining district never had a better outlook than at the present time. Prospectors are hard at work seeking for the refractory ore with which this district abounds. At present there are more private claims being worked than properties owned by stock companies. The Ross-Hannibal has considerable ore on its dump taken from the tunnel being driven to strike the old shaft in which rich silver ore was found, but abandoned on account of water. Two shifts are working. Ernest May is working a force of men on the Mark Twain. The Troy Co. is drifting from the bottom of the 50-foot shaft sunk last year. David Arnold has the contract and is working two shifts. The Thanksgiving will resume development work some time this month, negotiations being made with parties to thoroughly develop the property, which consists of five claims. Three new ore chutes have been recently struck in the well-known Hardscrabble mine. The ore is high grade.

IDAHO.

YREKA DISTRICT.—Wardner *News*, May 3: Wm. Merry, George Gardner and Alonzo Shankland are

busily employed developing the Silver Queen lode, one of the claims of the Silver King M. Co. on Government gulch. They have been engaged in putting the main tunnel in shape and are now opening up a slope of good concentrating ore in one of the upper levels.

BIG CREEK.—Frank Prichard and others are engaged in extending their tunnel on the Myrta May lode, located on the north side of South Fork near Miner's Cabin. Considerable work was done on this claim during the early days of the camp, and a resumption of operations shows confidence in the property.

EVOLUTION DISTRICT.—H. N. Freeman and Fred Shoeder keep steadily developing their claim on Two Mile gulch, known as the Midnight. Their tunnel is in 80 feet with very good indications showing gray copper and galena.

ROSEBUD GULCH.—Fred Franks, Chas. Mead and A. L. Senfield have commenced running a second tunnel on the Knickerbocker, an extension of the Cour d'Alene Nellie.

WARDNER RAILROAD.—A party of engineers commenced on Thursday a survey for the projected railroad down Milo gulch. They started at a point adjoining the concentrator of the Bunker Hill and Sullivan mines, and continued their line down the west side of the gulch.

MONTANA.

THE ANACONDA OPENING.—*Inter-Mountain*, May 9: The work of reopening the Anaconda and St. Lawrence mines was formally started last night. The bulkheads had been taken out the Sunday before and the work of exploring that portion of the mine above water was undertaken. The fact of this being done was kept carefully a secret for fear of disappointment, the manager says, but there were too many interested and the news was soon public property. It also soon became known that the mines had been but little injured by flood-fire, and when it was made public that the pumps were drawing off the water and a large force of men was working above the 400, the supposition generally was that ore would soon begin to issue from these great properties. When these mines were first entered the water was found to have risen within 30 feet of the 600-foot level of the Anaconda and the St. Lawrence. Above these points every level on both sides has been thoroughly explored with most gratifying results. Not only was no fire discovered, but it was learned that the damage by fire and water has been trifling compared with what had been expected. The magnificent Anaconda mine is in nearly as fine condition as it ever was. There has never been any fire in that mine and a thorough exploration has shown that there have been no caves. As to the St. Lawrence, where the fire actually was, the damage is trifling compared with what might be reasonably expected. The only cave-in is on the 500-foot level and that is of small importance. Burned timbers must of course be replaced, but Supt. Carroll gave it as his opinion that the sum of \$5000 would repair the damage and place both mines in good condition. Of course the loss to the company by the closing of the mines during the past 5½ months cannot be easily calculated, but the direct loss, it is believed, can be covered by the sum mentioned. It is about two months since the pouring of water into the great mines began. The water was not turned down the shafts, but was directed chiefly to the 200-foot level of the St. Lawrence by the north shaft, spreading itself from this point. The process was most successful, extinguishing a fire that might have burned for years. It is thought a month will be amply sufficient to repair all damages and place these in as good condition as they were before the fire.

NEW MEXICO.

ANOTHER RICH STRIKE.—*Southwest Sentinel*, May 6: A rich strike was made last week by Ben Hobson in one of the claims belonging to the Hobson group of mines at Blackhawk. The strike uncovered a body of fine ore some of which will run \$5 per pound. The ore is free milling and carries native silver in large flakes, which can be extracted from the rock with a knife. Nat Scarlett, James Corbin, J. J. Bell and the other owners of the Pennsylvania and Center mines at Carlisle have leased the properties to John A. Miller, Miller taking a royalty of 25 per cent, the owners getting 75 per cent. Since our last issue Mr. Miller obtained a lease from the Carlisle company to 20 stamps of the mill. The company puts the mill in good running order.

STRUCK IT RICH.—Jack McNeill and Vance Nicholson have taken a lease on the Jim Crow mine at Carlisle. They ran a crosscut from the bottom of the shaft and struck a breast of three feet of solid ore which averages, across the lead, \$250 in gold and \$114 in silver. This breast of ore was found at a depth of 60 feet. The ore is being sacked preparatory to shipment. John Eply and R. T. Bailey are the fortunate owners. The Imperial is the west extension of the Jim Crow and in every respect like that mine, except that so large and rich an ore body has not been found. The owners intend sinking on the end of the claim which connects with the Jim Crow a shaft 25 feet deep and then drift, where they expect to find the same class and as large a body of ore as exposed in the Jim Crow.

OREGON.

REDUCTION WORKS.—Baker City *Democrat*, May 5: Yesterday evening E. L. Giroux, manager of the Giroux amalgamating works, foundry and machine shop to be located in Baker City, arrived from Portland, and his trip here is to make all final arrangements for the erection of the plant at the earliest possible day. The company that he represents and the citizens of Baker City have come to a definite and positive understanding and contracts have been signed. The \$25,000 subscribed by the people to stock in the enterprise has been placed at the disposal of the company and now all that remains to be done is for the company to make a selection of the site upon which to erect the plant, and as the company has three different locations under consideration this matter is only the work of short deliberation. Mr. Giroux intends, as early as possible, to go East, where he will select the proper machinery for the foundry and machine shops. Reduction works in Baker City at this time means a wonderful impetus to the development of the mines not only of this county, but of Grant and Union tributary to this city.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 6, 1890.

427,286.—VEHICLE WHEEL—W. S. Wilson, Tombstone, A. T.

The following brief list by telegraph, for May 13, will appear more complete on receipt of mail advice:

- California—James E. Beach, Router, thrashing machine; Henry B. Cory (assignor of one-half to A. W. Eames) Los Angeles, monkey wrench; Ernest H. Cheerton, Los Angeles, waffle-iron handle; Lewis M. Cement, Oakland, and C. C. Watres and L. Heynemann, S. F., turntable; Thomas J. Daniels (assignor to Perry & Co.) S. F., machine for sewing up the mouths of filled bags; Simon J. Ford, Placerville, car-coupling; Hugo Gornall, S. F., combined yarn winder, darrer and spool-stand; William C. Hamilton, San Jose, fruit-grader; Henry O. Hoper, S. F., type-writing machine attachment; Frank A. Huntington, S. F., crushing-mill; John Manson, North Bloomfield, stump extractor; William H. Masser, Los Angeles, metallurgical apparatus; James W. Mitchell, S. F., incrustation preventive; William R. Quinn, Pinole, mixer for explosives; Mathurin G. Robineau, S. F., street-sweeping machine; Joseph L. Stillman, Fresno, non-conductor covering; Haden Swain, S. F., delivery or fly-finger for printing machines. Oregon—William M. Chamberlain, Sheffield, Ala., H. B. Smith, Massachusetts, and R. L. Warner, Portland, vehicle wrench. Washington—Joseph Ridby and G. W. Reed, Seattle, car-coupling.

NOTES.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DRIER.—Eiton R. Shaw, assignor to Mosher, Shaw and Craig, S. F. No. 427,198. Dated May 6, 1890. This is a drier or evaporator for fruit, vegetables, etc. A difficulty in this class of driers is a failure to dry uniformly in all parts of the drier, a necessary operation to enable the material under treatment to emerge in as near a uniform degree of desiccation as will insure its proper keeping qualities, color and flavor. This drier is intended to overcome this difficulty as well as to enable the operators to handle their work with facility and profit.

ADJUSTABLE BED-BOTTOM AND BRACE.—Preston G. Gesford, Napa. No. 427,168. Dated May 6, 1890. This invention consists of a series of diagonally disposed bars crossing each other, and slotted so as to be adjustable to each other and to the sides of the bed to which they are to be applied as to fit within any given size, and to serve as a brace to stiffen the bed. This will prevent the bed from twisting and getting out of place when being moved about the floor.

CABLE-TIGHTENER FOR CABLE RAILWAYS.—J. C. H. Stut, S. F. No. 427,205. Dated May 6, 1890. This invention relates generally to the class of cable railways. It consists essentially in a means whereby the slack cables of a cable system can be drawn tight while the cable is in motion. Though the invention may be applicable to different arrangements of cables, it is applicable especially to that known as the "windlass system" in which the driving sheave has a certain number of grooves, say five or six, and the follower-sheave one groove less than the driving-sheave, so that the incoming cable goes around the driving-sheave first, and thence over the follower-sheave, and from this back and forth between the two sheaves, and finally leads off from the driving-sheave in the engine-house to the mine under the street.

TELEPHONE.—J. C. H. Stut, S. F. No. 427,204. Dated May 6, 1890. The object of this invention is to make the telephone small and inexpensive, producing a large volume of sound and greater variations in the undulations of both primary and secondary currents, so that conversation may be carried on over a greater distance, and inductions, leaks and resistances better overcome. It consists in the employment of a confined body of air, oxygen or other gas, which combines with the carbon when a current of electricity passes between the contacts, thereby increasing the temperature

and decreasing the resistance between the contact points as the vibrations increase the pressure, and decreasing the resistance as the pressure decreases. This is effected by the employment of an airtight case, within which the operating mechanism of the telephone is contained, and in which the diaphragm forms a portion of one side. Within this case is contained air or oxygen under pressure, so that a large number of atoms of oxygen per unit of area are interposed between the contacts. The variation of resistance to the electric current takes place in unison and harmony with the sound-waves striking the diaphragm, the sound-waves being thus transformed into heat-waves of varying temperature by the agency of the electric current between the contacts. The invention further consists of certain details of construction.

STREET SWEEPING MACHINE.—Samuel F. McMill, S. F. No. 427,185. Dated May 6, 1890. This machine involves the employment of brushes and elevators. Its novelty lies mainly in the number and relative location of the elevators. The brushes are located at the rear of the machine. They sweep the dirt into the first elevator, which carries it forwardly and upwardly. It is then delivered upon a cross-carrier, which conveys it to the side of the machine and discharges it into a second elevator, which carries it upwardly and backwardly along the side to the rear of the machine, and delivers it by a suitable spout into the dump-wagon which drives up alongside. Thus a sufficient elevation is gained and the most convenient point of dumping is had. Another point of novelty lies in a peculiar adjustable gutter brush adapted to automatically conform itself to the inequalities of the curb and gutter. The whole machine is simple, compact and light running.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SACRAMENTO ELECTRICAL CONSTRUCTION CO., May 10. Capital stock, \$10,000,000. Directors—W. Gambs, N. B. Lazard, G. W. Daywalt, W. R. Lett and W. B. Reynolds.
CALIFORNIA GUILD, May 10. Object, to deal in real estate. Capital stock, \$10,000,000. Directors—Isaac Trumbo, Alexander Badlam, A. W. Robinson, Richard K. Allen and C. D. Allen.

REVENGE G. M. CO., May 10. Location, Siskiyou Co. Capital stock, \$1,000,000. Directors—Jabez Howes, J. W. Pew, E. L. Campbell, R. S. Wheeler and R. L. Apple.

SILVERADO M. CO., May 10. Location, Napa Co. Capital stock, \$10,000,000. Directors—Isaac Trumbo, Alexander Badlam, Andrew J. Young, Daniel Patten and M. F. Patten.

CLINTON CONS. M. CO., May 10. Capital stock, \$3,000,000. Directors—Robert Stevenson, H. William Dunvan, D. Guttman, J. F. Holling and F. T. Bennett.

SAN JOSE CONSTRUCTION CO., May 13. Capital stock, \$1,000,000. Directors—W. B. Hickok, George M. Lee, F. B. Pritchard, George M. Chamberlain and J. I. Scoville.

STOCKTON ELECTRIC CONSTRUCTION CO., May 13. Capital stock, \$1,000,000. Directors—F. E. Birge, T. E. Curran, A. Humphrey, G. A. Koch and J. J. Scoville.

BACON LAND AND IMPROVEMENT CO., May 10. Capital stock, \$500,000. Directors—H. D. Bacon, F. P. Byron, F. S. Page, Charles M. Berlin and F. A. Berlin.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

- J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
EDWIN TILDEN—San Francisco.
SAMUEL CLIFF—San Luis Obispo Co.
O. J. WADE—San Bernardino Co.
W. W. THORNTON—Los Angeles and Orange Co's.
E. B. TAFT—San Joaquin Co.
JOHN E. HILL—San Diego Co.
E. H. SCHAFER—Calaveras Co.
FRANK S. CHAPIN—Colusa and Tehama Co's.
W. B. FROST—Merced and Stanislaus Co's.
Geo. Wilson—Sacramento Co.
T. M. STACRUS—Sierra Co.
H. KELLEY—Modoc Co.
H. B. PARKER—Del Norte Co.
W. H. HILLGARY—Oregon.
R. G. PARSONS—Oregon.
R. G. HUSTON—Montana.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscriptions, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MECHANICAL PROGRESS.

Russian Sheet Iron.

Some improvements appear to have been patented lately in the East for the manufacture of planished or "Russian iron."

The making of Russian sheet iron was long a mystery. It is pretty fairly well understood in this country now, though. Probably American manufacturers were never so baffled at anything as they have been for years past in trying to find out how planished sheet iron, such as locomotives are covered with, was manufactured in certain iron works in the realms governed by the great White Bear. They sent spies abroad, furnished with plenty of money for carrying on researches. They went—if reports are true—themselves. They tried every kind of art known to commercial diplomacy, but all in vain. No one could find out how Russian iron was made. America, for once, had to confess herself beaten in a great technological process.

Workingmen, foremen, and upper mechanics were hitten with the craze. Numbers of such—if the stories current in iron-making circles are to be trusted—turned the whole of their little possessions into cash and went off for a sojourn in the Muscovy to try and ferret out the much- coveted secret. Howsoever craftily they went about their business, howsoever well they tried to disguise themselves, they invariably returned home very little wiser than they went.

At length, however, by dint of various odd pieces of information that had been learned from those who had been abroad in the quest, and by dint of exhaustive researches made on the subject in scientific laboratories, a clue began to be arrived at in the matter. There are people, well informed, to be found, it is true, who persist that the true secret is still confined to Russia. This is a mistake, though it is true that a great deal of Russian iron is still imported. Nevertheless, the process is known.

Some interest will perhaps be felt by our readers in a short account of it.

The aim of the process may be said to be the removal of the coating of oxide of iron that invariably forms over the surface of all iron sheets, and the preservation of the true iron surface in a way calculated to withstand air and moisture. The process itself is carried out by reheating sheets, of Number One material, with a layer of charcoal that has been shaken over them from a linen bag. The action of the charcoal, or carbon, is, of course, to combine with the oxygen in the oxide and reduce the latter to metallic iron.

A species of Russian iron can be made in this way. Still it is only a species—only a *pseudo* kind of thing. Now comes the secret as to making the legitimate article.

First of all, it may be said that the above is only an account of the most salient chemical points in the process. Here are some of the mechanical details. They are mentioned for those who may take some special interest in reading them. According to one Michael Neolawich—a refugee who visited some iron works recently at Pittsburgh and professed himself familiar with, at least, the mechanical department in dressing Russian sheets, refined iron sheets are taken in making Russian iron. This is hammered under a tilt hammer into narrow slabs, calculated to produce a sheet of iron 56x28 inches, weighing, when finished, from 6 to 12 pounds. These slabs are put into the reheating furnaces, heated to a red heat and rolled down in three operations to something like a sheet. This must again be hammered to reduce its thickness, and to receive the gloss or polish. A number of these sheets, having been again heated to a red heat, have charcoal, powdered into as fine a powder as possible, shaken between them from the bottom of a linen bag. The pile then receives a covering and a bottom in the shape of a sheet of thicker iron, and is placed under a heavy hammer; the bundle is grasped with tongs by two men, and is pushed backward and forward by them, so that every part may be well hammered. So soon as the redness goes off, the sheets are finished, so far as that part of the operation goes. Now they have received some of the polish. They are heated and treated differently in this respect, but instead of having the layer of powdered charcoal placed between them, each two red-hot sheets have a cold-finished sheet put between them and again hammered. After this process they are finished, so far as the thickness and gloss goes. The sheets are thrown down separately to cool, after which they are taken to the shears, placed on a frame of the proper size and trimmed. After being weighed they are rolled into flats, seconds and thirds, according to their polish and freedom from spots and flaws. A first-class sheet must be like a mirror, without a spot on it, the same as can be seen on the jacket of a locomotive boiler. Four heats are required to finish the sheets. Besides the finished sheet, a quantity of what are called red sheets are made, which are not polished and do not undergo the last operation.

The main chemical secret as to making the true, bona fide Russian article, has been protected recently by American letters-patent. Therefore there cannot be anything, as it were, out of Court, in mentioning it. The true secret lies in using lead in conjunction with the charcoal. This tends to oxidize in the heating furnace. To get oxygen it reduces the oxide of iron. Afterward the plumbic oxide, combined

with some metallic lead, enters the pores of the iron and produces the body which it was desired to produce. Of course, there are many details that have to be observed in applying the lead. It has to be reduced to a very thin condition for one thing. The details, though, need not be gone into here. What we have in the main to insist on is that Americans have found out, according to the most reliable information we can obtain, how at length to accomplish what has baffled American metallurgists so long.

Undoubtedly there is still a great deal of "American-Russian iron"—a second-rate article—in the market. Every machinist and working mechanic knows that. He knows it by having to deal with it constantly. It is used not only for locomotives, but for furnaces, stoves and what not. Still this does not go to invalidate what we say. The real thing is expensive to produce. From that, and some other causes, the imported article is enabled to hold its own pretty well. The main point to remember, though, is that home producers are in a position to manufacture first-class planished iron, if commercial and other reasons should cause them to see fit to do so.—*Western Machinist*.

Improvement in Utilizing Iron Sands.

Late information from New Zealand states that an improved method of fluxing the iron sand which abounds on the west coast there has been discovered. Every one who is acquainted with the commercial resources of New Zealand is aware that it possesses on the coast immense stores of iron sand of remarkable richness. Hitherto no economical method of securing a flux of that sand has been discovered, although large quantities of these sands have been worked even at the great cost encountered in consequence of the superior quality of the iron thus obtained. Experiments of this kind have also been made in this city, near which, along the Pacific Coast line, large quantities of iron sand are known to exist.

The *British Manufacturer*, in noticing this alleged discovery, says:

Authorities agree that if the valuable mineral sand there found could be brought into commercial use, New Zealand would at once become one of the most important iron-producing countries in the world. It is not surprising, therefore, that the announcement of the alleged discovery has created a very great sensation.

The statement is that Messrs. Minall & Jones have discovered a process which they are, of course, keeping secret until it has been protected by patent. Some hesitation is evinced in accepting the truth of this report. That a flux is in existence is well known. That, however, is not sufficient; it must be economical, and the accounts received from New Zealand give no indications of the cost at which this sand can be used. It is not a question of practicability but of expense, and what is required to make New Zealand an important iron center is that an economical flux should be discovered.

A short time ago something was heard in London of a company which was to test the petroleum deposits and the iron sand of New Zealand, but it was subsequently stated that so far no economical available means of dealing with the iron sand had been discovered. Therefore, until there is clear evidence that some one cannot only deal with the iron sand, but deal with it economically, all reports, as the one now to hand, will be received here with a good deal of skepticism.

AN ALARM FOR HOT BEARINGS.—Christian Agerskov of Copenhagen, Denmark, has devised an alarm for hot bearings, which it is claimed will be both effective and useful. The idea embodied is to arrange an explosive, in association with certain chemicals, so that a certain degree of heat will cause the explosion and warning before the heat reaches a destructive stage. A small sheet of sheet-metal—something like a cartridge-shell—is filled about halfway to the open top of the explosive. A paraffine globular capsule, hollow inside, is filled with sulphuric acid and sealed. This globe is laid on top of the explosive, and a mixture of borate of potash and sugar is filled in all around it; then a stopper or plug of cork or rubber is put in, sealing the cartridge. A hole is drilled in the box or bearing and the cartridge set in. Should the bearing run dry, the heat will melt the paraffine capsule, letting the sulphuric acid come in contact with the chlorate and sugar mixture, which will immediately explode the cartridge, causing a loud detonation and a light and volume of smoke, so that attention is immediately called to the condition of the bearing. This invention, it is claimed, has wonderful merit, and has been patented in many of the European countries.

COMPRESSING LIQUID STEEL.—Some time since a French physicist discovered that steel was strengthened by being compressed while in a liquid condition, and Messrs. Kropp of Essen are now producing sound steel ingots under pressure. The pressure is applied in a very novel fashion. The steel is poured into the ingot molds, which are then hermetically sealed, and liquid carbonic acid is introduced into the top of the mold. The heat of the molten metal evaporates the acid, and the confined gas exerts a very high pressure upon the metal.

SCIENTIFIC PROGRESS.

The Fear of Death.

The first element in the fear of death is an idea of physical pain. It is natural that this should be connected with the idea of death, for in many cases intense pain precedes death. But the two are far from being invariable accompaniments. Intense pain may be followed by life as well as by death. We must distinguish between the fear of pain and the fear of death. Death may be painless. Pain and death do not stand in the relation of cause and effect. One is sometimes the preceding condition of the other, but not a cause. Besides this, the fact must be recognized that death is but a point of time—an instant, a second—and that neither the preliminary process nor the immediate dissolution is constantly attended by pain. Even the worst death may be welcomed as bringing a release from suffering. So let us thrust aside the notion of pain and keep carefully separated from it the fear of death.

Second, is the idea of the mystery of the change. Let us keep closely in mind what death is—it is an instantaneous change. One moment was life, the next was not life. One instant was the exercise of vital energies, the next their total stoppage. One second, one was with this world; the next, he is gone from it forever. This mystery, unlike pain, is inseparable from death and the idea of death. One cannot think of death and not think of the mystery of the change and the loneliness of it. Every one has to encounter it for and by himself.

Third, is the idea of that which is beyond death. This idea also is inseparable from the contemplation of the change. Whether one believes in a life beyond the grave or in annihilation, makes no difference. There is something beyond, and the dread of that mystery

"Puzzles the will.
And makes us rather bear those ills we have
Than fly to others that we know not of."

All these three ideas are connected with death; and yet the change is one that is being encountered every day. There are few who have not seen one die. It is a matter of general knowledge that the number of death beds where the one who was experiencing the change has been unnerved is very small. The dying one is not moved by his loneliness. He does not weep at the separation. What grief he does manifest is more for those who are left than for himself who is going. Whether a weakened vitality hunts his sensibilities, or whether he is prepared for the last great change by unusual strength, matters not. There is the fact, when the dying man comes to die, at the real and very decisive moment he has no fear of death.

PERILS OF SCIENTIFIC BALLOONING.—THE HIGHEST ASCENT.—The most remarkable of Mr. Gaisber's balloon ascents was that undertaken on Sept. 5, 1862, from Wolverhampton. The intention was to reach the greatest height possible. The balloon left the ground at a few minutes past one o'clock, and at the end of 45 minutes a height of five miles was reached. Mr. Gaisber began to grow faint on account of the rarefaction of the air. When half a mile more had been mounted, he lost the use of his hands and limbs, the temperature being 5° Fahr., and the height of the barometer only 9½ inches. A few moments afterward he fell back insensible in the car. His companion, Mr. Coxwell, who had been employed as aerostat, then attempted to stop the ascent by pulling the valve-rope; but this had become twisted on account of the rotary motion of the balloon. It was necessary to climb up into the rigging to disentangle it. On attempting to come down, he found his hands frozen and insensibility beginning to creep over him. Placing his arms on the ring, he dropped down into the car. After several ineffectual efforts he succeeded in catching the valve-rope with his teeth, and by dipping his head a few times he caused the escape of enough gas to make the balloon take a decided turn downward. Mr. Gaisber soon recovered and resumed his observations upon the instruments. During the few moments before he became insensible, the balloon had been rising at the rate of 1000 feet per minute. Thirteen minutes of insensibility followed, and the rate of descent was found to be 2000 feet per minute. A minimum thermometer indicated that the lowest temperature attained was -11.9° Fahr., and Mr. Coxwell observed the lowest barometer to be 7 inches. These data warranted the conclusion that the maximum elevation had been 37,000 feet, or 7 miles. The first 3 miles of descent were accomplished in 9 minutes. The balloon was then checked by throwing out ballast, but the ground was reached in safety, about 100 minutes after the departure from Wolverhampton.—*London Iron*.

EARLY GLOBES.—Atlas of Libya is said to have discovered the use of globes, and Greek and Roman writers made several allusions to them. The celestial preceded the terrestrial globe by many centuries. The oldest globe in existence, dating from 1070, is now at Florence, and though less than eight inches in diameter, gives 1015 stars. Five metallic globes made by the Arabian astronomers in the thirteenth century are still preserved, one belonging to the British Royal Astronomical Society. The terrestrial globe appears to date from 1492. The first map on which America appears was

found among the papers of Leonardo da Vinci at Windsor Castle, and as it is drawn in eight gores, it seems to have been intended as a globe. The next terrestrial globe of interest was that completed by Mercator in 1541, having a diameter of 16 inches. Various others succeeded, until in 1592 Mollineux constructed several enlarged and improved globes 26 inches in diameter, differing but little from modern globes except in geography. One of these still remains in the library of the Middle Temple, London. About the time Mollineux's work was done, Hues' Treatise on the Globes was published in Latin, and quickly went through many editions and translations. It has just been reprinted in English.

THE ANCIENT AND THE MODERN FOOT.—A noticeable thing about the statues found in our museums of art, supposed to represent the perfect figures of ancient men and women, is the apparently disproportionate size of their feet. We moderns are apt to pronounce them too large, particularly those of the women. It will be found, however, that for symmetrical perfection these feet could not be better. A Greek sculptor would not think of such a thing as putting a 9-inch foot on a 5½-foot woman. The types for these classical marble figures were taken from the most perfect forms of living persons. Unquestionably the human foot, as represented by these old sculptors, was larger than the modern one; and in fact the primitive foot of all people of whom we have any record, either in printing or statuary, was considerably larger than the restricted foot of modern times. The masculine foot, forming an approximate average of four different countries, was about 12 inches long; this would require at least a No. 12 or 12½ shoe to cover it comfortably. The average masculine foot to-day is easily fitted with a No. 8½ shoe, and is therefore not above 10 7/16 of an inch. Now, by the old empirical rule of proportion, a man 5 feet 9 inches in height should have a foot 11½ inches long, or one-sixth his height. It was of no great consequence what size sandals he wore, but he would have required a modern shoe of at least a No. 10½ for a minimum fit, or a No. 11 for real comfort. For women, allowing for the difference in the relative size of the two sexes, which was about the same then as now, a woman of 5 feet 3 inches in height would have had a foot ten inches long, requiring a modern shoe—it ought to be spoken only in a whisper—No. 6 as the most comfortable for that foot, or a No. 5½ as the limit of torture. The reason for the difference between the old classical foot and the modern one is obvious—restriction is what has done it.

SIGNING A CHECK BY ELECTRICITY.—One of the marvels of electricity, and one of the most striking of the Edison exhibits at the Paris Exposition, was the little instrument which enables the operator to sign a check 100 miles distant. The writing to be transmitted is impressed on soft paper with an ordinary stylus. This is mounted on a cylinder, which, as it revolves, "makes and breaks" the electric current by means of the varying indentations on the paper. At the receiving end of the wire a similar cylinder, moving in accurate synchronism with the other, receives the current on a chemically prepared paper, on which it transcribes the signatures in black letters on a white ground.

INDIA RUBBER.—Henry M. Stanley, in an interview with a New York *Herald* correspondent, said that the Aruwimi forest, which belongs to the Congo Free State, was enormously richer in everything, especially in rubber trees, than the Amazon forests. This section of Africa, he declared, would be the rubber reservoir of the world. This is certainly encouraging for American wire manufacturers who use rubber in their insulation. Such a statement from so reliable an authority ought to have a salutary effect on the market price of rubber.

LIQUID MASSES.—Herr W. Spring has found that the free surface of a liquid is chemically more active than its internal mass. To show this, he puts into dilute hydrochloric acid a slab of marble slightly thickened at its upper end so as to form a resting-place for bubbles; where the bubbles gather, the marble is very rapidly eaten through. So also on blowing air on any spot; and so on putting a slab partly within and partly outside the liquid.

HUMBOLDT IN FAULT.—The expedition of the Philadelphia Academy of Natural Sciences to Mexico has resulted in exploding some very erroneous ideas in regard to the height of Mexican volcanoes. They found Popocatepetl to be nearly 3000 feet lower than the measurements of Humboldt. The total height of the mountain, making allowance for minor barometric corrections, is 14,700 feet above the sea level.

A NEW CHEMICAL MANURE.—M. Ville, a professor of chemistry in Paris, states that he has discovered a new chemical manure—intense and almost miraculous in its effects on the vine. It consists of a mixture of phosphate of lime, carbonate of potash, and sulphate of lime, which, if placed round vine-growths, will enable them to defy the onslaughts of the phylloxera.

OZONE.—Olszewski, the Russian physicist, has succeeded in liquefying sufficient ozone to determine the boiling point, which is 159 Fahrenheit. The liquid ozone is dark-blue in color, and is nearly opaque in a layer of a tenth of an inch thick.

GOOD HEALTH.

Medicinal Value of Olive Oil for Snake-Bites, Etc.

In our issue of April 12th we gave some account of the treatment of snake-bite by the use of olive oil as practiced by C. R. Earley, M. D., of Ridgeway, Pa. That gentleman having received that copy of our paper containing the article, writes us as follows:

"The copy of your journal containing a statement of my treatment of snake-bite by the use of olive oil came to hand. Please accept my thanks for your kindness in sending me a copy. In your statement a *teaspoonful* is given as the dose. It should be given in *tablespoonful* doses, and not less, and repeated every few minutes till the bowels are freely moved. A half-dozen doses are generally all that is required. The wound should also at once be scarified and packed with the olive oil.

"Olive oil is also a sure remedy for gall-stones if given freely. We have used it freely in practice and it has proved entirely satisfactory; we use none other than the pure virgin oil. We have it imported in original packages from the manufacturers.

"In hemorrhoids, or piles, of long standing, we use it with wine by the mouth and as an injection combined with chloride of sodium, boracic acid or sulpho-carbide of sodium and laudanum. We always use it in snake-bites and it has never failed. (My practice has been very extensive.) I have never directed any other treatment. The inhabitants of localities where rattlesnakes and copperheads are found always keep a good supply of olive oil in their houses, and when bitten never call a doctor, but use olive oil freely, which in every case gives full and complete relief.

"Olive oil has been used for various medicinal purposes in all ages. It was mentioned by Pomet, chief druggist to Louis XIV, to which he adds his father's observation, fourth edition, 1748. He says: 'It is a natural balsam for the cure of wounds, being heated up with wine. It is of wine and this oil that the Samaritan balsam, with which the Good Samaritan in the Gospel healed the wounds of the traveler, was made, and it is a medicine in use at this day.' It was and is now freely used internally in many cases with marked success."

[The above letter is especially interesting and valuable to us here in California, where the production of pure olive oil is so promising and thriving a young industry.—EDS. PRESS.]

Health Commandments.

1. Thou shalt have no other food than at meal-time.
2. Thou shalt not make unto thee any pies or put into pastry the likeness of anything that is in the heavens above or in the waters under the earth. Thou shalt not fall to eating it or trying to digest it. For the dyspepsia will be visited upon the children to the third and fourth generation of them that eat pie, and long life and vigor upon those that live prudently and keep the law of health.
3. Remember thy bread to make it well; for he will not be kept sound that eateth his bread as dough.
4. Thou shalt not indulge sorrow or horror anxiety in vain.
5. Six days shalt thou wash and keep thyself clean, and the seventh thou shalt take a great bath, thou, and thy son, and thy maid-servant, and the stranger that is within thy gates. For in six days man sweats and gathers filth and bacteria enough for disease; wherefore the Lord has blessed this bath-time and hallowed it.
6. Remember thy sitting-room and bed-chamber to keep them ventilated, that thy days may be long in the land which the Lord thy God giveth thee.
7. Thou shalt not eat hot biscuits.
8. Thou shalt not eat thy meat fried.
9. Thou shalt not swallow thy food unchewed or highly spiced, or just before hard work, or just after it.
10. Thou shalt not keep late hours in thy neighbor's house, nor with thy neighbor's wife, nor his man servant, nor his maid servant, nor his cards, nor his glass, nor anything that is thy neighbor's.—*New England Farmer.*

CITY AND COUNTRY—There is practically no disease, with the exception of typhoid and malarial fevers, which does not claim a larger number of deaths in the large cities than in the country (i. e., smaller towns, villages, and sparsely settled regions). Take consumption, for instance, and diseases of the nervous system. Out of every 100,000 of population in cities, 285 persons die of consumption. Out of every 100,000 of population in rural districts, 160 persons die of consumption. In diseases of the nervous system the figures are respectively 255 for the city and 150 for the country. These data give a very good general idea of the increased risk of living in large cities. In reality, probably very few people are acquainted with these facts, or, if they are, very few would be influenced by them in the choice of a home. And yet, when we take up our abode in a great city like New York, how deliberately we increase the number of factors which are constantly conspiring to shorten our lives. We nearly double our chance of dying of consumption, and increase by 75 per cent the

likelihood of acquiring some fatal nervous disorder. It would prove interesting reading if the intricate web of causes which produce such results could be unraveled—whether of poverty or tenement-crowding, alcoholism, dissipation, the excitement of speculation or business reverses, its position of relative importance could be assigned.

DIGESTION will not begin till the temperature of the food has been raised by the heat of the stomach to 93°; hence the more heat that can be imparted to it by slow mastication, the better. The precipitation of a large quantity of cold food into the stomach by fast eating may, and often does, cause discomfort and indigestion, and every occasion of this kind results in a measurable injury to the digestive functions. Ice-water drunk with cold food of course increases the mischief. Hot drinks, hot water, weak tea, coffee, chocolate, etc., will, on the contrary, help to prevent it. But eat slowly, anyway.

THE BUILDER.

A Crime.

The *American Architect* has recently unearthed a building transaction in which a contractor built a block of houses, which, under the contract, he was bound to connect with a street sewer. He found in excavating the cellar that to fulfill his contract he would be obliged to blast out a sewer way through solid rock, at a far greater expense than he had supposed would be necessary. Rather than do this or notify his employer and seek a compromise, he ran his pipes in another direction into a pile of loose stones where the sewage would gradually filter away, but impart their exhalations upward into the surrounding air. Soon after the houses were occupied, a mysterious illness began to occur in them. The Board of Health inspectors were called in, and soon found the cause of the trouble, but the public are not informed whether the builder was brought to justice. Of course he ought to be, for the protection of the public in future, but, in practice, it is difficult to obtain convictions. There is no condemnation too severe for a scoundrel who will deliberately and secretly propagate disease after this fashion. The offender who openly commits or maintains a nuisance detrimental to the public health is harmless in comparison, for the mischief he does is immediately apparent and can be remedied. But the death-trap set by such builders as those above described, are revealed only by their fatal results. The man who puts up a building so flimsily that it falls to pieces and destroys life before it is completed, is easily brought to suffer a penalty. But the man who willfully breeds deadly disease in a household, in a whole district, surely this man is the worse villain of the two, and as fit for the gallows as the meanest type of felony can make him.

A SERMON ON BUILDING MATERIAL—Brick is still, and is likely to remain, the favorite building material. There is nothing, except a Wedgwood crucible, that will withstand fire nearly as well. Iron is confessedly unfit for building purposes, where it may be exposed to the weather or fire, and is going rapidly out of use. Stone will always have its uses in combination with brick and terra-cotta, but stone will not weather any better in this climate than well-burned brick. Egypt, the land of all others where stone was most available, depended on the use of brick mainly. Along with her ruins of stone are yet to be seen imposing piles of brick, and sun-baked brick at that, not more timeworn than the massive stones around them.—*Architecture and Building.*

CONS. IMPERIAL—At the annual meeting of the Consolidated Imperial Mining Company, there were represented 404,357 out of 500,000 shares. The directors were re-elected as follows: A. K. P. Harmon, James Newlands, J. P. Martin, Maurice Schmitt and J. H. Dohinson. A. K. P. Harmon was appointed president, C. L. McCoy secretary, and W. E. Sharon superintendent. The financial statement showed an overdraft at the Bank of California of \$19,998.31, and the assessment now being collected will aggregate \$25,000. The superintendent's report embodied an account of the work done in the mine during the twelvemonth, and concluded with the following hopeful sentence: "As there is still remaining a large scope of unexplored ground, I hope yet to develop a large and valuable body of ore."

GERMAN ENCOURAGEMENT OF MINING—The Mining Department of the German Government has recently taken steps to establish in six different towns in the principal mining districts a free library specially for the mining population. These libraries are furnished with all the principal works on geology and mining, a complete collection of maps and all the journals devoted to mining.

"FOUR MILLION DOLLARS were taken out of the South Fork mines during the year 1889," says the *Mullan Tribune*, Idaho. "More than two-thirds of this amount was spent in the Cœur d'Alene in the development of mining property and other enterprises. There will be at least \$20,000,000 taken from our mines during the year 1890, and the wealth will keep increasing each year."

USEFUL INFORMATION.

AMERICAN AFTER ALL—Americans have read with interest the alleged invention of an artificial silk by a Frenchman, who displayed his supposed invention at the Paris Exposition last year. It turns out that the invention is as old one, and that it is an American invention. Says the *Scientific American* of March 8, 1890: "The recent development of the production of artificial silk by M. De Chardonnay, in France, has excited much interest. We have received communications from David Baldwin of Midland Park, New Jersey, who, as far back as 1871, had worked in the same direction. He claims to have succeeded in producing a cellulose fiber which he combined with tannic acid and other substances in his attempt to increase its tensile strength. Four or five years ago Mr. Baldwin made known his project to a silk manufacturer, Thomas Holt, who not being a chemist, did not care to experiment in that direction. The matter therefore lay in abeyance. Now France comes forward as the fatherland of an invention apparently conceived in America."

THE USEFULNESS OF TURPENTINE—After a housekeeper fully realizes the worth of turpentine in the household, she is never willing to be without a supply of it. It gives quick relief to burns; it is an excellent application for corns; it is good for rheumatism and sore throats. Then it is a sure preventive against moths; by just dropping a trifling in the bottom of drawers, chests and cupboards, it will render the garments secure from injury during the summer. It will keep ants and bugs from chests and storerooms by putting a few drops in the corners and upon the shelves; it is sure destruction to bedbugs, and will effectually drive them away from their haunts if thoroughly applied to all the joints of the bedstead, and injures neither furniture nor clothing. A spoonful of it added to a pail of warm water is excellent for cleaning paint.

STEEL SCREWS are quite a recent innovation, and there has never been a description published of the process of making them. The process has been kept a secret, and much pains have been taken to guard the peculiar mechanism by which this work is done. The large amount of capital requisite to start in so extensive a plant as is necessary to produce this sort of goods, and the supposed narrowness of the margin of profit, were assumed to be sufficient protection to those already engaged in the business. It has been necessary to invent and construct almost the entire plant of machinery by which the work is done. These screws are manufactured by the National Screw and Tap Co. of Cleveland, O. The capacity of the company's works is 6000 gross of screws and two tons of taps and small nails per day.

A REMARKABLE GOMMY LIQUID, formed upon and dropping from the foliage of the pine trees, in the vicinity of Danville, Va., has been attracting a great deal of attention. It gathers on and drops from the pine tags like a heavy dew, and a great deal of it has been caught and preserved in bottles. It has much the appearance of corn whiskey, but has a taste somewhat like that of wild honey. It leaves the pine tags sticky, and gives them the appearance of having been varnished. One theory is that it is produced by the remarkable weather which has prevailed in that vicinity for some time past.

A PASTE THAT WILL KEEP—Dissolve a teaspoonful of alum in a quart of water. When cold, stir in as much flour as will give it the consistency of thick cream. Carefully heat up all the lumps. Stir in half a teaspoonful of powdered resin. Pour on the mixture a teaspoon of boiling water, stirring it well. When it becomes thick, pour in an earthen vessel. Cover and keep in a cool place. When needed for use, take a portion and soften it with warm water. It will last at least a year. If you wish it to have a pleasant odor, stir in a few drops of oil of wintergreen or cloves.

THE DIRECTORS of the Provincial Bank of Ireland have issued a decree that no clerk in their employ receiving less than \$750 a year shall be allowed to marry. A similar rule is in force in some of the principal London banks. How would it do to advance salaries in such cases to an amount a little in excess of \$750 per annum?

A PETRIFIED TREE IN PLACE—A petrified tree nearly four feet through and with roots extending over about 15 square feet, was found recently in a coal mine at Osnabrück, Germany, and has been set up in the Berlin School of Mines.

TO RENDER PAPER OR PASTEBORD WATER-PROOF—Mix four parts of slacked lime with three parts of skimmed milk and add a little alum; then give the material two successive coatings of the mixture with a brush, and let it dry.

A NEW CALCULATING MACHINE—A French mechanic by the name of Bollie has invented a calculating machine which adds, multiplies and divides with astonishing rapidity by the simple turning of a wheel.

ARTIFICIAL MUSK is a new product of the chemists. It is an oily liquid of a brown color, and smells so like musk that perfumers are able to use it as a substitute for that article.

ELECTRICITY.

Electrical Progress.

The generation of electricity in the present state of the art depends entirely upon mechanical conditions, and here is the path which inventors should for the present tread. The steam engine and boiler are now necessary for supplying the power to run the dynamo, but there are two immense sources of power in Nature which ought to be and can be made available for this purpose. Wind and water are abundant, cheap, and almost universal. Some progress has already been made in utilizing water power, but only in a moderate degree. Every running river, every waterfall and cataract, possesses power now running to waste beyond the ability of man to calculate.

With the constant improvement in the storage battery, another means of power becomes available. The wind that blows free through the atmosphere can be harnessed and brought into the service of man. A windmill properly connected with the dynamo can be made to generate electricity, which could be stored up for future use. The wind is a more variable source of power than water, and at present cannot be depended upon for furnishing a constant supply, but the storage battery here comes in to our aid. Why should not vast reservoirs for the storage of electricity be constructed, just as we build them for water storage? Is not American inventive genius sufficient to solve this problem? We believe that it is.

When these two sources of power—the wind and the water—are thus utilized, who can dream even of the extension of the application of electric power?

Again, why should not small dynamos, furnishing sufficient power to run diminutive motors for domestic purposes and small industries, be constructed, operated by coiled springs or rubber bands, wound up and stretched by clockwork? The principle is old, only the application would be new. There are numerous instances where mechanical power could thus be profitably employed.

Thus the field for electric-power is constantly broadening, and it will be the duty of inventors to supply the mechanical devices by which this field can be occupied. That they will do this we feel fully confident, for American inventive genius has always risen to the needs of the occasion, and indeed the greatest inventions the world knows and uses to-day have been supplied by the brains of our own citizens.—*Boston Journal of Commerce.*

ELECTRICITY AS A SCALE PREVENTIVE—A correspondent of the *Boston Journal of Commerce* gives his experience in the use of electricity as a scale preventive, as follows: "The writer, some years ago, had charge of a boiler that had a battery connected to the shell of the boiler, so that it was kept charged all the time, and though the water was very hard, there was never any accumulation of scale, though the neighbors were all troubled with a heavy accumulation that used the same kind of water, and they tried all sorts of solutions to prevent it. This boiler was put in in 1876, and is still running. Some time after I left it I wrote to the concern to find the address of the firm that put it in, and learned that they thought it too much trouble to attend to it and had gone to using potatoes instead. Of course, the latter are known to be among the best scale preventives."

AN ELECTRIC AFTER DINNER SPEECH—At a banquet of electrical engineers in Boston, a few evenings since, those occult gentlemen assured the public that the dwelling-house of the future will be fitted for electricity as it now is for gas, not only to give illumination, but also to furnish power to run the sewing machine, the egg-beater, and even to butter the bread economically, to warm the house, to cook the food, etc., and, if necessary, to put the family to sleep. Why not go further, and apply electricity to house-cleaning, sweeping the carpets, dusting the rooms, making the beds, etc.?

ELECTRICAL TOOTH-EXTRACTOR—An electrical instrument has been invented which is designed to remove the pain incidental to the extraction of teeth. It consists of adjustable, pivotally connected prongs carrying buttons and connected with an electrical battery, the buttons being placed on the face over the nerves leading from the teeth to the brain, and a circuit established the moment the tooth-extracting instrument touches the tooth to be removed.

LIGHT AND POWER—In conducting an electric station in North Carolina, the dynamo supply enough energy to run the street cars, and to light the cars and general industries along the line. This is believed to be the only instance where light and power are furnished so extensively by the same machinery. But other illustrations of it are likely to follow at an early day.

ELEVEN MILES POWER CIRCUIT—A company which has been formed in Hartford, Conn., proposes to build a dam across the Farmington river at Tariffville, put in dynamo, etc., and generate electricity, which is to be conveyed by large copper rods, strung above ground, to Hartford, 11 miles away. About 2000 H. P. will be turned into electric energy.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Wet-Crushing Silver Mill, 329. The Vineyard in Autumn; Winter Scene in a Riverside Vineyard, 331. The Holland Woven Belt for Concentrators, Spanish Peak, 337.

EDITORIALS.—A Wet-Crushing Silver Mill; The Molders' Strike, 329. Passing Events; Analysis of an Air-Tight Pump; Mining Stock Quotations; Sinking Shafts in Watery Ground; Just Punishment, 336. California at the World's Fair; Cost of Working Gold Deposits, 337.

CORRESPONDENCE.—Mines and Mills of Shasta County; Ruby, Washington; The Deep Gold Placers of California, 330.

MISCELLANEOUS.—Singular Geological Phenomenon; Grapes for Raisins, 331.

MECHANICAL PROGRESS.—Russian Sheet Iron; Improvement in Utilizing Iron Sands; An Alarm for Hot Bearings; Compressing Liquid Steel, 334.

SCIENTIFIC PROGRESS.—The Fear of Death; Perils of Scientific Ballooning; Early Globes; The Ancient and the Modern Foot; Signaling a Check by Electricity; India Rubber; Liquid Masses; Humboldt in Fault; A New Chemical Manure; Ozone, 334.

GOOD HEALTH.—Medicinal Value of Olive Oil for Snake-Bites, Etc.; Health Commandments; City and Country; Digestion, 335.

THE BUILDER.—A Crime; A Sermon on Building Material, 335.

USEFUL INFORMATION.—American After All; The Usefulness of Turpentine; A Paste That Will Keep; Miscellaneous, 335.

ELECTRICITY.—Electrical Progress; Electricity as a Scale Preventive; An Electric After-Dinner Speech; Electrical Tooth Extractor; Light and Power; Eleven Miles Power Circuit, 335.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 332-333.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 340.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 340.

Passing Events.

The first general movement in this State toward the preparation of a California exhibit at the coming World's Fair, was made this week by the Governor issuing circulars on the subject to the mayors of the cities. By starting thus early, California should be able to make a creditable showing of its various industries.

The streams all over the country are running bank-full owing to the rapid melting of the snow in the mountains. The main rivers are very high, but thus far no damage has been done.

The quartz mines of Fresno county are just now attracting some attention. Few of them are at any advanced stage of development, but there is quite an area that promises to furnish many valuable quartz properties.

The strike of the molders in this city still continues, to the great detriment of the iron industry here. However, all the shops are now running, having brought men from the East to take the place of the strikers. Nevertheless, there is still much inconvenience in the situation.

The Kansas smelting men claim to have invested \$7,000,000 in their smelting plants, but a leading Colorado smelter has investigated this and says that the investment does not reach \$750,000.

Analysis of an Air-Lift Pump.

At the last meeting of the Technical Society of the Pacific Coast, P. M. Randall, C. E., read an elaborate paper giving an analysis of the action of the Pohle air-lift pump which was recently described in the MINING AND SCIENTIFIC PRESS. This invention of Dr. Pohle for lifting water consists, in its simplest form, of a water pipe, and an air pipe let into it. In pumping, compressed air is forced through the air pipe into the water pipe; thence, by the expansion of air, the water is lifted and discharged from the upper end of the water pipe. As air is forced into the water pipe it forms alternate layers with the water so that the weight or pressure per square inch of the column, thus made up of air and water inside, is less than the pressure of the water per square inch outside the water pipe.

Owing to the difference of pressure, the water flows continuously from the outside into the water pipe by the force of gravity. As the air is forced into the water pipe the water at first above the outlet end of the air pipe rises in an unbroken column free from bubbles and flows smoothly off, till the underlying column of propelling air escapes. Owing to the relief afforded by the discharge of this under column—whose pressure while the column is being lifted, checks the flow of water into the pipe—the action of the pump is somewhat irregular. This is, however, but temporary, and is succeeded by constant uniformity of action by which the pump discharges an intermittent or pulsatory stream.

With respect to the diameter of the water pipe of the air-lift pump that may be employed with success, Mr. Randall states that he has tested the working of pipes respectively two, three, eight and ten inches in diameter with highly favorable results, and sees no valid reason for there being a limit to the diameter providing the quantity of air employed be proportioned to the water. If small quantities of air be let into the water pipe, insufficient to constitute a layer pressing against its walls, the air will obviously rise in bubbles through the water and escape, with limited results; but if a sufficient quantity of air be forced into the water pipe to form an air-layer pressing the pipe-walls, and to impart proper motion to the superincumbent water, the water will be successfully discharged with inappreciable loss by leakage, regardless of the magnitude of diameter of the pipe.

In working the air-lift pump, maximum efficiency is attained when the pressure per square inch of the aggregate layers of water inside the water pipe is equal to two-thirds the pressure per square inch outside of it. In other words, when the aggregate length of the water-layers inside of the pipe is equal to two-thirds the depth of submersion, estimated between the surface of the water and the outlet end of the air pipes, the energy due the pressure of the remaining one-third of the depth of the submersion is expended in imparting motion to the contents of the pipe and in overcoming the resistance of entry or inflex and the resistance of the walls of the pipe.

Mr. Randall goes at great length into details of tests and mathematical calculations as to efficiency and the determination of various features. He concludes by referring to the fact that in pumping hot liquids the efficiency of the device is increased by the utilization of the force of their head; that it pumps water carrying sand, silt, gravel, sewage, etc., with facility and without appreciable injury to itself; and that it possesses rare merits with respect to lightness, compactness, durability, property of being handled and managed with ease, cheapness as to first cost and subsequent cost of being kept in use—in fine, ultimate economy. Its application to mining has already been referred to in the PRESS. The system is being applied to mines in Colorado now by its inventor.

THE Pelton Water-Wheel Co. have just issued a new illustrated catalogue. It has been prepared evidently with great care, and presents much more information bearing upon water-wheels than anything of the kind before issued. The data and tables cover all points of inquiry on this subject. The typographical appearance of the catalogue is excellent.

THE slate quarries of El Dorado county are doing very well just now.

Sinking Shafts in Watery Ground.

Of all kinds of work for which the skill of the engineer is called into requisition, that of making excavation in earth where a head of water is to be resisted is conceded to be the most troublesome. The name quicksand is given to any earth which when mixed with water will in some degree run like a fluid. Almost any sand when mixed with a small amount of clay, will exhibit this faculty. The most troublesome kind has but a small percentage of sand and is very fine, the material being principally disintegrated rock. When rubbed between the fingers scarcely any grit can be felt. This material, when undisturbed, may have some consistency, but when once broken will flow with water through any minute opening. In excavation in running ground the great difficulty is not so much in keeping the water out as in preventing damage from quicksand shifting in its bed, which is likely when water is pumped from the excavation, as it destroys the equilibrium of the mass. In the case of deep excavations like shaft work, it will bring an unequal or hending pressure on the walls of the shaft, which destroys its alignment or ruptures the shaft entirely.

The freezing process for working this kind of ground has now passed the experimental stage and is entitled to a place among established processes of engineering. Edward L. Abbott, C. E., read a paper recently before the Boston Society of Civil Engineers, in which he describes the application of the process. A series of vertical pipes are put down into the rock, into material impervious to water. These pipes are arranged around the space in which the excavation is to be made and are closed at the lower ends. There is on each an inner pipe open at its lower end and extending nearly to the bottom of the outer.

Through these pipes a cold fluid is circulated by means of a pump; this admits the heat from the surrounding earth and freezes it as hard as sandstone rock, most effectually cutting off the water. Then the excavation can be readily made without any trouble from water or flowing ground. Quicksand, when deprived of its water, is an easily worked material.

By this method a shaft 15 feet square was sunk about 100 feet to a rock ledge, through water-bearing strata at the Chapin mine, Iron mountain, Michigan. Twenty-seven eight-inch freezing pipes were arranged in a circle 29 feet in diameter. An immense ice-machine, of the compression type, was used. The wall was frozen and excavations made to the ledge in 2½ months. On starting the ice-machine, the earth commenced to freeze in the form of cylinders, surrounding each pipe. In ten days these cylinders were in contact, forming the frozen wall. From that time the freezing advanced within much faster than without the circle. The unfrozen center became narrower as the excavation proceeded, requiring much difficult labor in loosening the frozen material and hewlers. Those strata of earth containing much water were frozen to much less distance than those containing little water.

When approaching the ledge there was a great inflow of water, the rock being seamed and shaly, and it was necessary to lay freezing pipes against the ledge, and to flood the shaft and freeze a considerable portion of the rock surface itself before the excavation into the sound rock could be completed and the timbering put in. In shafts now sunk, the freezing pipes are sunk five or six feet into the rock itself.

ERNEST WILTSEE, formerly assistant superintendent of the North Star mine, has been appointed superintendent of the Menlo mine at Grass Valley. Mr. Wiltsee was at one time chemist of the Globe Smelting and Refining Company of Denver and is a graduate of the Columbia School of Mines. He is highly spoken of at Grass Valley.

THE Chamber of Commerce of Bordeaux, France, has offered a series of prizes for the best reports, based on actual experience, of the use of oil at sea. The competition is open to the vessels of all nations, and reports must be made by Jan. 30, 1891.

A NUMBER of German engineers have been looking over tracts of land near the City of Mexico with a view to the location of extensive smelting works.

Cost of Working Gold Deposits.

The main tendency in handling gold ores and gravels in these days is toward economy. Elaboration of processes and methods has long since been discontinued, for it is realized that the simpler the means the better. Each succeeding year sees at least a slight improvement in carrying out the methods employed, and every reduction in cost of a dollar or less brings to the front new mines to which that dollar's difference is a question of profit. Gold ores are now worked in this State cheaper than anywhere else in the world, and they are worked better, too. Years of experience have taught our millmen how necessary exact care and economy are.

In handling auriferous gravels, we have also experience in California not found elsewhere. The various forms of gravel mining have been here developed to their greatest degree. All known forms of gold deposits are found in this State, and in each there are men skilled in working them. In this connection a statement by John Hays Hammond in the last report of the State Mineralogist will be of interest. He gives the relative costs of working the various classes of gold deposits by methods adapted to the respective classes as follows:

1. Auriferous vein, \$3 to \$10 per ton of material treated.
2. Drift mining, 75 cents to \$4 per ton of material treated.
3. Miners' pan, \$5 to \$8 per ton of material treated.
4. Rocker, \$2 to \$3 per ton of material treated.
5. Sluices, 75 cents to \$1 per ton of material treated.
6. Hydraulic method, 1½ cents to 8 cents per ton of material treated.

California at the World's Fair.

Much interest is being kindled in the proposition for a full California exhibit at the Chicago World's Fair of 1892. The general sentiment seems to be echoed in the words used by Governor Waterman in a circular letter just issued to the chief officers of the cities and counties of the State, calling upon them to "bring to the attention of their constituencies the vast importance of California being properly represented at the World's Fair, to be held at Chicago, Ill., in October, 1892. The exhibition at Chicago will be California's opportunity, but she will lose that opportunity unless her representative men come to the front and present these matters for consideration absolutely necessary to induce the people of their respective localities to interest themselves in the welfare of the State." It is to be hoped that this exhortation will be heeded. Some organized effort is already under way, but it should be more general. It is important that the matter should be liberally treated by the coming Legislature, and for this purpose organization should be pushed in all Senatorial districts, and Assembly districts as well, for it is important to muster all possible votes in favor of the projects which will no doubt come forward at Sacramento. Governor Waterman has applied for ten acres of space, and it should be filled five stories high with California displays.

Mining Stock Quotations.

EDITORS PRESS:—Will you please decide through your valuable paper the following question: A wagers that mining stock quotations are so much per share. That is, if the stock is quoted 50 cents, and the stock is issued at \$10 per share, 50 cents is the price of the full share of \$10, and not 50 cents on the dollar. B wagers that the quotation is so much on the dollar, either above or below par as the case may be, and not so much per share. A. R. Virginus, Cal.

Mining stocks are quoted at their market value without reference to the original par value on the capital stock of the company when incorporated. In this State a mining company can assess the stock to its full capital or par value but not more, without reorganizing. This is the only advantage of organizing with a large capital stock, with original par value set at a comparatively high valuation. Many companies are organized with capital stock of a million or so, and shares at \$5 or \$10, when the stock is really sold for 10 cents or 20 cents per share. The market quotations mean what the stock brings on the market, and the original par value is not considered at all on the market.

LAST month the Cons. Cal. and Virginia mine milled 11,940 tons of ore, yielding \$194,653—about half gold and half silver.

The Deep Gold Placers of California

(Concluded from page 331)

white; streak lighter; hardness, 6; specific gravity, 2.921; contains silica 50.8 per cent, alumina, 10.4; as seen under the microscope the large minerals are not crystalline.

Another specimen, No. 2 (B), has been named andasite. It is from the large boulder referred to in Prof. J. D. Whitney's "Anthriferous Gravels of the Sierra Nevada," fol. 449. Color, gray, mottled with lighter and darker spots and blotches; streak lighter; hardness, 7; specific gravity, 4.403; silica, 44.3; alumina, 16.4; iron large; under the microscope minerals seem much like 2-A, but more compact.

White lava No. 3 (A), Calaveras county. Fusible B. B. to pearly globule; does not change color otherwise; luminous in flame like lime; no soda reaction; under microscope not sedimentary; texture and appearance like pomice; some parts hyaline. Under a high heat it fuses to a beehive glass. Muffle heat is not sufficient to so fuse a piece half an inch in diameter. Some parts turn white but do not fuse; refractory crystals are not seen until heat is applied; when heated and fused to a globule, it is pearly and translucent; with cobalt no blue color; not chalcidonic; perhaps solfataric but doubtful; does not seem to be volcanic ash.

No. 3 (B), marked Volcanic Ash, Napa county. Specific gravity, 1.81; silica, 66.8; sesquioxide of iron, 9.9; fusible before blowpipe to black slag; color and streak, ash gray; hardness, 4; when highly magnified is white, opaque, vitreous paste, with imbedded angular, transparent, white and grayish glassy fragments like hyalite or impure semi-opal. A very interesting specimen.

Another specimen of No. 3 (C) somewhat resembles 3-A but is porphyritic, filled with vesicular cavities, almond-shaped with a white opaque shell, rock filled with cracks showing a tendency to disintegrate, cavities generally empty, sometimes containing acicular crystals; sometimes botryoidal, not chalcidonic; generally, numerous minute vent-holes for water or steam indicate a solfataric origin.

No. 4, from Messenger's Corral, Calaveras county, seems to be a mud porphyry; hardness, 3; gray matrix with white spots and white and dark particles; soft when recently quarried, when it cuts like tallow or soapstone.

Table Mountains.

What are known as table mountains in California are the remains of "mesas," so called by the Spaniards, which were once continuous

A New Ore Concentrator.

Mr. H. P. Holland, a practical mining engineer of this city, has recently invented a concentrator which combines the well-known blanket process with new and original features. He claims that the machine does away with the faults of the old system while very much increasing its capacity, and saving a much higher percentage of the metals. It consists of an endless corrugated woolen belt, backed by strong waterproof material which is stretched over rollers hung in a suitable frame. It is fed at the upper end, and underneath is a revolving bristle brush kept in constant action against the belt, while the machine is in motion, thus cleaning the belt at every revolution. With the exception of the belt and brush, the machine is built entirely of metal and in a very substantial manner. The concentrator has been sub-

THE HOLLAND WOOLEN BELT FOR CONCENTRATORS.

mitted to severe tests, and the inventor states that it has amply sustained its high claims as to saving capacity over others. The accompanying cut gives a very good idea of the machine. Fuller particulars can be had by writing to the inventor, Mr. H. P. Holland, 2322 Folsom St., San Francisco.

RANCHERS AND MILLMEN.—C. M. Taylor of Genoa suggests a new plan for the ranchera and millmen of Nevada to settle their pending litigation. The *Courier* says: His plan is for both parties to take the money that will, ac-

COMPRESSED FUEL.—A bag of rough, dark balls, looking somewhat like unshucked black walnuts, was lately handed us from the Giant Fuel Co. of S. F. They were composed, we understand, of coal-dust with a small admixture of cornmeal, lime and potash, which had been wet, stirred together, molded and dried. The sample was taken home, where it was used in the cook-stove with great approval, and a wish was expressed for more of the same sort. This device for utilizing the coal-dust, which has so long been useless, appears to be a valuable one, and it is estimated that the total cost of the "Irving Patent Fuel," manufactured, need not exceed \$5 per ton. The company has established a plant of 10-ton daily capacity on Main street, and will soon be making it in considerable quantity.

MUNN C. HILLYER, who was at one time a

Comstock mining superintendent, but lately a mine-manager in Central America, died in New York this week. Mr. Hillyer has been connected with mining matters on this coast from "early days."

The first printer in this State was Juan de la Rosa, who came to Monterey in 1833 with a printing and publishing outfit for the Mexican Government. He will be 100 years old on June 5th, and his birthday will be celebrated at Ventura. It has been suggested that a purse be raised for him, to brighten his remaining

Just Punishment.

Two of the so-called "patent agents" who have been carrying on the business of duping inventors by false pretenses of negotiating the sale of their patents, received heavy sentences this week in the U. S. Court. They were convicted of having used the United States mail for carrying out a fraudulent scheme. Both men were out on bail, with relatives on their bonds, and attempted to leave the State and get out of the jurisdiction of the courts. This plan was forestalled by the officers, however, and the men were arrested, handcuffed, brought back and imprisoned. On Wednesday they received sentence. Clarence Sanborn was sentenced on the various indictments to a total of three years imprisonment and \$750 fine. Samuel Sanborn, one of the other persons implicated, and whose trial was to have come up next, was so much impressed with the severity of the sentence that he pleaded guilty, and threw himself on the mercy of the court. He was given eighteen months in prison and further condemned to pay a fine of \$100.

After the sentencing of the Sanborns, District Attorney Carey surprised those in the courtroom by asking for a nolle prosequi against E. S. Atkin, who, he said, informed the officers of the Sanborns' plan for escaping, and it was only by reason of this information that they were recaptured. The Judge granted the request. Atkin is now in Escondido, Mex.

These people have for several years been conducting business under various names, the principal one being the "Globe Patent Agency." Their ostensible business was to conduct the sale of patents and patent rights.

Circulars were addressed to inventors all over the country, and by various means sums of from \$15 to \$20 were obtained from numbers of patentees, generally on the plea of making a search for title to carry out an impending sale. After securing the money, nothing was done and the inventors would get no further information. Many complaints have been made to the police and others, but these schemers have heretofore been able to get out of the law's meshes. This time, however, they were unable to escape the United States authorities.

While there are, of course, honest institutions for the sale of patents, there are also many of the kind conducted by these men. It behooves patentees, therefore, to inquire closely into the standing of those with whom they have dealings of that nature. If the scoundrels could be weeded out of the big cities and punished as these will be, it would be a good thing for the inventors of the country.

The Mining Bureau Museum.

The following are among the recent additions to the collection of California State Mining Bureau:

- Chalcodite—Santa Barbara, from M. Goldtree.
- Calamine—Daggett, San Bernardino Co.
- Gold nugget (30 ozs.)—Blue Wing hydraulic mine, Iowa Hill, Cal.
- Gold—Fine specimen leaf, Kelsey, El Dorado Co.
- Native copper on analcite—Lake Superior, G. O. H. Reilly.
- Azurite and malachite—Holbrook & Cave mine, Arizona, Lewis Williams.
- Large number of Indian arrow and spear heads, stone axes, etc.—J. Z. Davis.
- Number of polished specimens of Scotch and Irish granite, J. Z. Davis.
- Minerals from Eastern States and Japan—J. Z. Davis.
- Auriferous porphyry and quartz—Cerro Colorado, Mexico, M. A. Delis.
- Rich gold quartz—Silver Peak, Nevada, John Chiatowitch.
- Gold quartz from Beveridge, Inyo Co., Cal., John Chiatowitch.
- Native silver—Silver King mine, Arizona, John Skinner.
- Gold in quartz—Mariposa, J. Z. Davis.
- Several specimens of gold quartz—El Dorado, Cal., H. E. Stockwell.
- Gold and quartz crystals—Jamestown, Cal.
- Polished serpentine—Amador Co., Cal., R. A. Weiss.
- Rich gold quartz—Gambetta and Mountain View mines, Fresno Co.
- Alabaster—White Plains, Nevada, W. E. Lindsey.
- Gold quartz—Shasta Co., Cal.
- Scheelite—Julian, San Diego Co., A. J. Burnett.
- Lava—Hawaiian Islands—J. Bryant.
- Dendrite—Petaling, Cal., B. C. Hesseltine.
- A number of specimens of rare minerals from the Eastern States—Miss S. P. Monks.
- Minerals from Santa Catalina Islands, and various ores, building stones, etc.

The rivers of the State are at a very high stage, owing to the rapid melting of the snow in the mountains.

NINE Comstock lode mines milled last week 6562 tons of ore valued at \$78,275.

SPANISH PEAK, SEEN FROM ONION VALLEY AT FOOT OF PILOT PEAK.

plains and are supposed to be lava from some source not yet determined, but owing to the fluidity of the eruptive matter, they were very nearly level. Natural erosion subsequent to their birth, caused deep depressions. The intact portion remained, capping low summits, now elevated table mountains.

The surface of these mesas exhibits none of the features of volcanic matter ejected from a crater, so conspicuous at Vesuvius, Hecla, Aetna, Manna Loa and other great volcanoes.

It is not uncommon on the Pacific Coast to find the lavas brecciated or conglomerated, the matrix being entirely different from the fragmental inclusions, so much so that the observer naturally infers that the so-called lava partook somewhat of the nature of plastic earth or volcanic mud, and that in its flow it had gathered boulders of a somewhat similar but older formation. At Picket Post, Pinal county, Arizona, obsidian pebbles were abundant in the lavas. At the Spring Valley hydraulic mine, Butte county, boulders of basalt and quartz were seen so imbedded.

From a distance these flat mountains show an extended horizontal summit, terminated at one or both ends by a mural cliff, from the foot of which a talus of fallen debris extends at a sharp angle to the plain below. Fig. 7 is an ideal view of a California table mountain and a lava-capped ridge.

cording to present appearances, he spent in litigation, and use it for the construction of a large flume to run almost direct from Rodenhah's to the mills. This, he claims, would carry one-third of the stream at low water, which would be sufficient to run the mills, considering that there would be but little water or evaporation, as the water would run that distance in a flume in about one-sixth of the time required for it to flow down the regular channel. This would leave the ranchers two-thirds of the stream for irrigating purposes.

The coal trade between Newcastle, N. S. W., and this port has fallen off greatly. In the last quarter there were shipped 29,000 tons of coal, as against 69,000 tons in the preceding quarter. The collieries on this coast are now producing coal in such quantities as to reduce the price from \$12.50 to \$6.50 per ton.

A LARGE deposit of antimony is reported in the Toasra mountains south of Big Creek, Lander Co., Nev., and 15 miles from the Nevada Central R. R. The ore is said to carry 80 per cent antimony.

days, and the printers and publishers of the State are to be called upon to contribute to it. Stephen Bowers, editor of the *Ventura Free Press*, Ventura, Cal., will give any information desired.

ARID LAND IRRIGATION—There promises to be a sharp conflict over the subject of Government irrigation work for arid lands. On another page of this issue may be found full outlines of the two reports presented by the Senate Committee on Irrigation—the committee which visited California last summer. As will be seen, the two reports are directly in conflict. It will have to be fought out at Washington, and there bids to be much fun in the air before it is over.

GEORGE GOODMAN of this city has been engaged by Governor Stanford to lay the artificial-stone walks, in the highest style of the art, in the arcade of the Leland Stanford Jr. University at Palo Alto.

THE Humboldt reduction works, Winnemucca, Nev., will soon be started up again.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER WHEEL MOTORS.

Varying from the fraction of 1 hp to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Olobe Cases, free of cost, by applying to the manufacturers.

KROGH'S MINING HORSE-POWER HOIST

Is known to be the Best Horse-Power Hoist now made. It is strong and durable.

The drum will carry 1000 feet of five-eighths steel rope. It can be used to run a pump—or blower, in conjunction with hoisting.

Manufactured by
F. W. Krogh & Co.,
51 BEALE ST.,
San Francisco.

THE ZANDER LAMP - BURNER.

No Trouble to Put in the Wick.

This Patented Burner has a slide-plate *b* on the wick-tube *B*, with grooved flange *b'*. The slide-plate is removed from the tube *B* and the wick inserted through the open side, the wick edges being easily pressed in past and under the edges of the tube. The slide-plate is then put back, fully inclosing the wick. With this it is unnecessary to force the wick through a closed tube and past its ratchet wheels. THIS PATENT IS FOR SALE. It is one of those every-day-use practical inventions of merit that will take. Address LOUIS ZANDER, 1223 Twenty-first Avenue, East Oakland, Alameda Co.

FRANCIS SMITH & CO.

Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal

Iron cut, punched and formed for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

GRANGER'S ROLLER STAMP MILL

Beats them all. Works dry ores. Makes even granulation. No dead work, hence minimum wear.
A. P. GRANGER, Denver, Colo.

GRANGER'S DRY ORE SEPARATOR

The very best. Uses no water. No freezing up. Saves handling waste. Saves high percentage. Send for circulars.
A. P. GRANGER, Denver, Colo.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ores by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringing. For further particulars, address

ALMARIN B. PAUL,
Middle Creek P. O., Shasta County, California.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in
adjustment than any other. Feeds coarse ore or soft clay
alike uniformly, under one or all the stamps in a battery
as required.

In the Bunker Hill Mill it has run continuously for two
years, never having been out of order or costing a dollar
for repairs.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frue" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Principal Office, 401 California St., cor. Sansone, S. F.
Location of Works, Oriskany Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR., (Signed)

Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

**Automatic Ore
 Feeder.**

RAILROAD FLAT, CAL., May 15th, 1889.
 MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.

Yours truly,

[Signed]

JAS. S. REYNOLDS,
 Supt. New York Mine, Railroad Flat.

THE LATE JOSIAH STANFORD.

The Pioneers Passing Away.

Those who were identified with the early mining history of this State are becoming fewer and fewer as the years roll on, and scarcely a month passes now but we are called upon to chronicle the death of some of these pioneers. Within the past week four prominent men, who came here in early days and were closely identified with the history of the State, have "passed over the river." Josiah Stanford, Alphens Bull, John H. Redington and Wm. P. Fuller were all men who, in building up the fortunes of the State, built up fortunes for themselves as well.

Josiah Stanford was the eldest brother of Senator Leland Stanford. He spent his childhood on his father's farm in Albany county, N. Y., and at the age of 18 went to New York City and spent a year in the hardware business, returning in 1836 to the farm, where

he remained until the California gold excitement of 1849.

Josiah Stanford was the first of the brothers to become infected with the gold fever. He took passage in the steamship Falcon at New York on the 27th day of August, 1849, via Panama, and entered the bay of San Francisco on the 31st of October, 1849, making the trip in 65 days.

Like the majority of the argonauts, his first anxiety was to reach the mines, and providing himself with the necessary mining outfit, he made his way to Mormon Island, where he wielded the pick and shovel as a miner with varying success for about a year. Becoming weary of the hardships of a miner's life, and becoming convinced that more gold could be gained in mercantile pursuits, Mr. Stanford laid down his pick and shovel and engaged in business at Mormon Island as a trader. He procured a stock of miners' supplies and gen-

eral merchandise, and soon found himself in the enjoyment of a lucrative business.

After trading at Mormon Island for another year, he sought a wider field of mercantile enterprise and moved to Sacramento, where he opened a general merchandise store. This he conducted successfully until 1856. In the meantime, induced no doubt by his representations, several of his brothers had arrived in California, and, forming a partnership, they opened an extensive oil and lamp depot, which they conducted until 1869, when Josiah Stanford withdrew from the firm, and, purchasing a vineyard, has since given his attention to viticulture and fruit-raising.

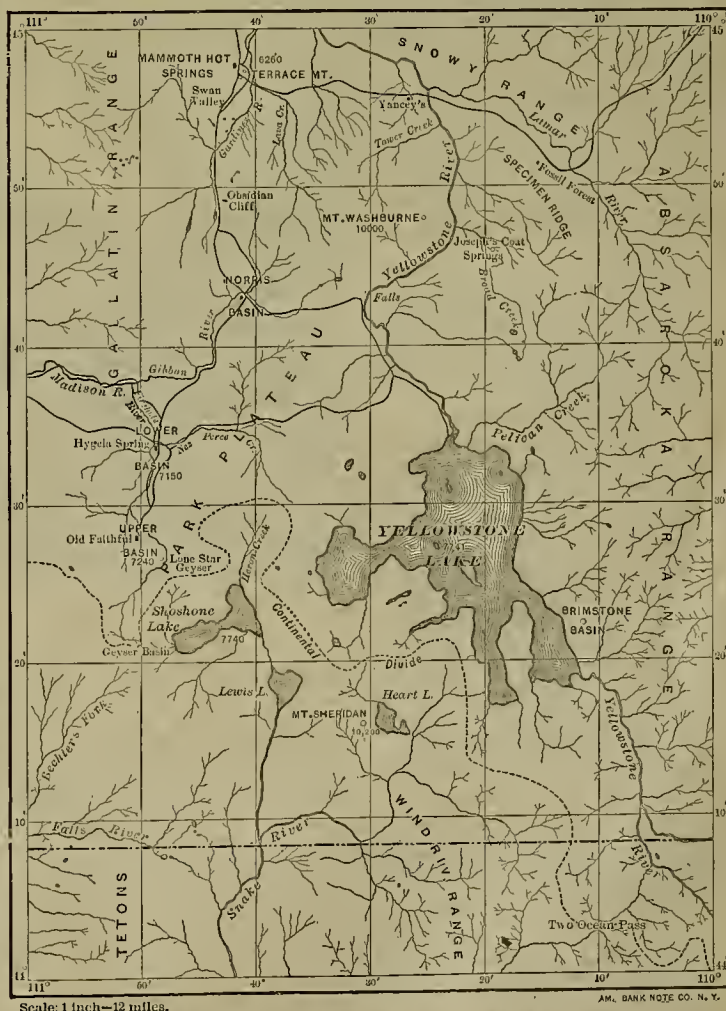

Among his other possessions is the famous Warm Springs Vineyard property, in Alameda county, which was given to him by his brother Leland. Mr. Stanford was a member of the Society of California Pioneers, in the affairs of which organization he took a deep interest. It was ever a matter of pride with him that he helped to lay the foundations of the great new State, whose welfare he always had at heart, though never given to the seeking after public preferment. He was one of the Board of Trustees of the Leland Stanford, Jr., University, and it is quite probable that had it not been for his efforts and representa-

tions, which brought Leland Stanford to this coast, California would not have rejoiced in that great institution. Mr. Stanford leaves a widow, son and daughter. He was 73 years old at the time of his death, but looked much younger, as he was a man of powerful frame and strong constitution.

Alphens Bull was accidentally drowned by falling from the seawall at Fort Point while visiting that place with his family. Mr. Bull was 74 years of age and a native of New York. Prior to his arrival in California in 1849, he was a minister of the Gospel. Shortly after his arrival here he moved to Red Bluff and Shasta, where he had a successful experience, and was soon one of the most prominent, wealthy and respected merchants of Northern California. He was then a member of the firm of Bull, Baker & Co., but having acquired a fortune, moved to San Francisco and became connected with the Fireman's Fund Company as its vice-president. This was 25 years ago, but since then he has also been prominently identified with other insurance corporations and mining operations in this city. He was president of the Gould & Curry and several other mining companies.

Besides his home at Leavenworth and Francisco streets, where he has lived a great

(Continued on page 352)

THE YELLOWSTONE NATIONAL PARK—See page 352.

Irrigation Surveys.

It is telegraphed from Washington that the irrigation of arid lands will be made a party question. Majority and minority reports have been completed by the Senate committee, and General Vandever says the same thing will likely happen in the House committee. Senators Stewart, Plumb, Moody and Casey have completed the Senate majority report.

Majority Report.

Following is a synopsis of the Senate majority report:

Before giving a detailed account of the investigation of the committee, some general observations and suggestions as to what action should be taken by the Government to enable the people to reclaim and settle upon the arid lands of the United States are submitted. Over two-fifths of the area of the United States, exclusive of Alaska, require irrigation to insure regular crops, and in at least four-fifths of the arid region, irrigation is a necessity for the production thereof.

This arid region comprises between 120,000 and 130,000 square miles, being a third larger than that of British India, and very similar to it in its general characteristics. The amount of land that may be brought under cultivation in the arid region is variously estimated at from 75,000,000 to 150,000,000 acres.

It is safe to predict at least 100,000,000 acres will ultimately be brought under cultivation by irrigation, and that, too, by water in sight, which, when properly utilized, will reclaim at least 10 per cent of the whole arid area.

The question for consideration is: What action should be taken by the Government to enable the people to reclaim these desert lands? Their reclamation must be initiated and executed by the people, and not by the Government.

In India, and in fact in all countries under monarchic or despotic rule, the work of irrigation has been carried on under Government control, and largely with Government money. The Government of British India has already expended several hundred millions of dollars in constructing irrigation works, and is continuing such expenditures on a most magnificent scale.

Reports show that the investment has been profitable to the Government and of the greatest possible advantage to the people, but there is no necessity for the United States to engage in such expenditures. If an opportunity is furnished to the people of this country, they will reclaim these desert lands, so far as reclamation is necessary. The most important action by the Government in aid of the reclamation of these desert lands was the passage of the Acts of October 2, 1888, and of March 2, 1889.

By the first of these Acts \$199,000 was appropriated for topographic surveys and \$100,000 for surveys pertaining to irrigation; \$60,000 was diverted by the Director from that purpose and added to the appropriation for topographic surveys, making a sum of \$259,000 for topography and leaving only \$40,000 for irrigation.

By the Act of March 2, 1889, \$200,000 was appropriated for topographic surveys, and \$250,000 for irrigation surveys. Of the sum appropriated for irrigation surveys, \$120,000 was diverted from that purpose by the Director and added to the \$200,000 for topographic surveys, making an aggregate of \$320,000 for topography, and leaving only \$130,000 for irrigation surveys and office and other expenses incidental thereto.

Your committee regards this as a plain violation of the statute and a misappropriation of money. It has been represented by the Director that a general topographic map of the arid region is necessary for an irrigation survey, and that unless it is made, the cost of that survey will be increased manifold. This statement it is impossible to comprehend.

It is, of course, easy to see that such a map would give useful information of a general kind and would be convenient for many minor purposes, but the engineers, while admitting this, testify with one voice that its usefulness goes no further; that such a map is not at all necessary in any imperative sense; that it will not save them any important amount of labor or expense; that the engineering surveys would be of the same character and cost the same whether they have maps or not; and that no use has been made of any topography by any of the engineers engaged in the irrigation survey except as a general map of the country.

A provision was inserted in the Act of Oct. 2, 1888, which is working a great hardship to the people of all the arid States and Territories. It was necessary to reserve all the lands which may hereafter be designated or selected by each United States survey for sites for reservoirs and ditches or canals for irrigation purposes.

As matters now stand, no entries can be made or titles perfected to any public lands of the United States requiring irrigation. Attention is called to this fact to show the importance of action on Senate Bill 2104, as reported from this committee.

The bill reserves the unappropriated waters of lakes and rivers on public lands for such beneficial purposes as shall be determined by the States and Territories where such waters are situated, subject only to the paramount authority of the United States.

It reserves the right of way for ditches, canals and other hydraulic works for irrigation

purposes, and allows the flowing to be diverted from their natural beds upon the arid areas.

It also reserves to the United States the adjudication of all questions that may arise in relation to storage conservation, flowing and distribution of all natural waters located at the boundary of States or Territories. It repeals all laws for the sale of lands where irrigation is necessary, except the mineral and homestead laws.

The bill also confers the power upon the Commissioner of Irrigation to regulate the amount of land which may be taken in a given locality by homestead settlers, not exceeding 160 acres. It further provides that when reservoirs, canals and other hydraulic works shall have been completed so as to irrigate all the land in a given district, patents may be issued to claimants of public lands in such district upon compliance with the laws in force at the time the claims were made, and also provides that when an irrigation district is formed in any State or Territory, and the laws of such State or Territory permit, legal voters residing in such district may tax the land of the State and of private individuals for the purpose of constructing such hydraulic works as are for the common benefit of all irrigable lands in such district.

United States lands therein shall bear the same burdens as are imposed on State lands and the lands of private persons, and homestead settlers who take such lands with irrigation works constructed for their reclamation shall take them subject to the payment of the same charges as have been paid by private parties for the same purpose; provided that the amount of such taxes shall be approved by the Commissioner of Irrigation, and that the United States shall not in any case be liable for any of such charges.

It further provides that the people of a district situated in two or more States, or in a State and Territory, may have the benefits of this Act by the joint action of all the States and Territories in which any portion of such district is situated, or in case any of the States or Territories refuse to join, then the State or Territory in which a large portion of the irrigable land is situated may perform all the acts necessary to enable legal voters to reclaim lands and secure the benefits of the Act.

The committee, believing that irrigation pertains to agriculture, and not to geology and other subjects under charge of the Director of the Geological Survey, and differing from the Director as to the mode of conducting such matters as relate to irrigation, has provided for the transfer of the irrigation survey to the Agricultural Department, and the appointment of a Commissioner of Irrigation in that department.

The passage of this bill, it is believed, will enable bona fide settlers and land-owners to develop the arid region by their united efforts. It will give full play to the enterprise of the pioneers of the West.

It avoids as far as possible Government interference, and frees the Government from the enormous expense which would be involved if the United States should undertake to supervise and control this vast region, as suggested by the Director of the Geological Survey. It also prevents the delay which would be occasioned by waiting for the expenditure of many millions of dollars in geologic and topographic surveys and in paleontologic, chemical and physical researches under the Director of the Geological Survey, and also avoids the embarrassment which would be imposed upon irrigation by charging to it the expenditures made by the Director of the Geological Survey for other purposes.

Minority Report.

Senators Reagan, Gorman and Jones of Arkansas say that, finding themselves unable to agree with the majority of the Senate Committee on Arid Lands, they submit a minority report. An analysis of the bill of the minority is made by sections and the effect of each section pointed out. The sections may here be characterized summarily:

Section 1 of the bill provides for the survey of arid lands into natural irrigation districts. Section 2 provides for the segregation of irrigable lands. Section 3 provides that lands already irrigated shall be declared irrigable for purposes contemplated in the bill. Section 4 provides that certain of the irrigation works shall be constructed only on sites designated and reserved therefor, in order to protect water rights and to conserve waters for beneficial purposes.

Section 5 provides for the division of waters among districts. Section 6 provides for the organization of districts situated in two or more States or Territories. Section 7 provides that non-irrigable lands shall remain in the possession of the General Government, as forests and pasture reservations, and catchment areas for irrigable lands, but it provides for the disposal of irrigable lands to homestead settlers in tracts not greater than 80 acres. Section 8 attaches water rights to the homesteads of irrigable lands. Section 9 makes it unlawful to construct unauthorized irrigation works.

Section 10 provides in general terms a plan for the organization of irrigation districts. Section 11 gives to the commissioners of irrigation districts authority to provide laws and rules for the use of waters belonging to the districts and for the protection and use of forests, and the protection and use of pasture. Section 12 makes it lawful for States and Territories to provide general legislation relating to the use of waters, forests and

pasture, and provides methods by which capital for the construction of irrigation works may be obtained.

Section 13 makes it lawful for States to provide a board of irrigation commissioners to supervise and approve the works authorized and contracts made by the district commissioners. Section 14 of the bill provides that cities and towns may be excluded from irrigation districts, and gives the States and Territories authority to designate the waters which such cities and towns may use. Section 15 provides a method for obtaining the consent of the States and Territories to the legislation proposed in the bill, and refuses the rights and benefits otherwise granted to any State or Territory which fails to give its consent.

The general effect of the bill is to turn over the control of irrigation to the States and districts. General statutes are to be made by the States and specific rules by the districts. Therefore it will accomplish local self-government in relation to irrigation and forest and pasture administration. It relieves the General Government of all subsequent legislative and administrative duties, except only to complete the irrigation survey of the whole and a survey of the irrigable lands.

The creation of a new bureau of irrigation in the Agricultural Department is unnecessary and unwise, therefore is not recommended. The director of the survey has expended a portion of the funds for necessary topographic work as part of the irrigation survey. This is strictly in compliance with the statute. The present irrigation survey is performing its duties in compliance with the law and in an efficient and thorough manner, and the work under it should proceed at a reasonable rate of progress until it is finished. It is estimated that the irrigation survey will cost \$7,000,000, but that in making maps it will save \$4,000,000 to the geological survey. Thus the real cost of an irrigation survey is but \$3,000,000 over and above the cost of a geological survey.

Comstock Mine Management.

The *Virginia Enterprise* says: The Comstock lode proper and its vicinity, created by the "influence" of the primal cause that formed the great ledge, is still as great a mining spot as there is on earth, and will entertain the mining energy of the world for the next hundred years.

Five-sixths of the incorporated institutions on this lode since 1878 have sold for far less than they could have been made to produce if decently managed, speaking without scruple about intelligent management. Capitalists can step into the San Francisco Stock and Exchange Board to-day and buy up a dozen mining properties at the ruling quotations, and clear all the way from 8 to 20 per cent a year on their investment and keep it up for a generation. There are exceedingly few favored spots on earth that can do better.

Why does mining not pay? The mining conditions on the lode are hampered with 30 years of gambling, of mismanagement, of more or less corruption, of experiments and non-eave. Paying ore is here in limitless quantities—the very same kind of ore from which dividends are paid the world over, excepting where they are worked under similar conditions as they are here. The men who are most deeply interested in mining operations could make more money on their investments working their interests as a farmer works his ranch, if they could get out of the old path and its fascinations. There is not a mining superintendent on the lode who would not have his life's desire if he owned the properties he superintends to the mere extent of what he could make out of them over and above expenses.

Taking it aside from the incorporated properties, this is a good section in which to invest money. There is room for a half-dozen big concerns to operate in Silver City, with every hope of fair reward. No man looking for a mine should overlook Silver City. There is hope of fair reward in Jumbo district, to the west of Mount Davidson. There is an inviting field to the northeast of the Sierra Nevada mine, and also northeast in the neighborhood of the Hendricks property. On the Brunswick lode, immediately east of the Comstock ledge, the prospects are most flattering, and it is only a question of a short time when it will be properly prospected. Very much now depends upon the success of the Occidental mine for this, and it is to be hoped that the ore will be given a fair chance. The recent development of ore in the Overman brings the American Flat section to the front as a fair field for investment.

HEAVY MINING SALE.—Advice from Oroville, Butte Co., state that the largest sale of mining property ever effected in the county has just been closed. The sale embraces the Cope, Union Cape and Greek Mining Co.'s property in the bed of the Feather river, commencing at the eastern boundary of this town and extending up the river nearly two miles. The upper portion of the ground was formerly known as Cape claim, and was mined in 1856, at which time \$1,000,000 was taken out. Only a small portion of the ground was worked, and that in a very rough manner. Major Frank McLaughlin made the sale and an English company is the purchaser. In addition to the mines the company will open vast tracts of country by a great irrigating canal, and create a great power adjacent to the place.

Mines of Lander County, Nev.

In a description of the resources of Lander county, Nev., published in the *Reese River Review*, we take the following paragraphs:

The two principal resources of the county are silver and the live-stock industry; the third resource being agriculture. The mines are principally located at Austin, Galena, Lewis, Bullion, Pittsburgh, Kingdon, Cortez, Mayesville, New Pass and Yankee Blade, with good prospects in every mountainous portion of the county. The Austin mines are mostly owned by the Manhattan Mining and Reduction Company of Chicago, with C. A. Pratt, Esq., as Superintendent, and as a part of the work a plant of five concentrators has been run for two years on the dump and waste rock that had been considered valueless for 20 years, at a profit of \$80,000 per year, or a total profit of \$160,000 for the company, besides half as much more to the laborers who were required in the work. There has also been large quantities of that celebrated ruby and black sulphure ore taken from the Union and other mines of this company, of which Lander Hill is so peculiarly celebrated, and with the unprospected ground between the Curtis and Frost shafts, delved into in the future, Austin will recover her old place among the large ore-producing camps of Nevada.

The Manhattan mines have produced over \$24,000,000 since 1865 alone, and the mines of the county not less than \$33,000,000 in the last 25 years.

The Galena Incorporated mines are now operated by a company, with A. G. Higbee as Superintendent, and it is intended to build a mill and work a large force of men this summer.

Many victorious and successful prospectors are engaged at Galena, outside of the main company, and their labors are being largely rewarded by handsome and paying returns.

Lewis, Bullion, Pittsburgh and Mayesville are situated in the northern part of the county, at which places are many mines of great promise, and which have produced large bullion returns, the Battle Mountain Silver Mining Company being the principal one at Lewis, W. H. Williams, Superintendent.

Pittsburg is controlled by an English company, of which Captain Seombe is Superintendent and Isaac P. Weaver book-keeper.

At Mayesville, Col. W. S. Wilson, whose pluck, business tact and energy are marvelous, has just completed a new mill, and the first five days run yielded over \$7,000 in bullion. The mines which Col. Wilson owns at Mayesville were discovered by him some few years ago, and the first 10 tons of rock taken therefrom and shipped to Reno netted Mr. Wilson over \$20,000, and the test just made of reducing the ores on the ground, makes it certain that these mines are to figure prominently in Lander county's prosperity in the future.

The Kingdon mines in the south end of the county, operated by General Spencer and John C. Irvine, promise large returns soon.

The New Pass gold mines were operated on a small scale last summer, after lying idle fifteen years, and produced the management of Starrett and Ramdohr over \$16,000 in gold bullion, and I have no doubt but that during the coming summer these mines, under the same management, will exceed the last year's results. These mines are situated in the extreme western portion of the county, some 25 miles from Austin, in the hills near New Pass on the old overland road.

Yankee Blade mines, some five miles north from Austin, have produced large quantities of the richest rock of any camp in the county, not excepting, we believe, Old Lander Hill; but the trouble at Yankee Blade is too much water. When machinery and money have been found to handle the water at Yankee Blade, handsome profits will be the result. Much praise is due Tim Connolly, Hank Easlin, W. E. Ford, and many others who have persisted in their confidence in these mines, and who have so long and patiently contributed their money and labor to their development.

The Patriot Mining Co. has just organized to work the Patriot mine at Yankee Blade, and is composed of Jefferson Hall, W. T. Hook, O. W. Hinchcliffe, O. B. Vincent, T. H. George, Andrew Blight, Jas. Rowe, Steve Buddie and P. T. Farrel. All these are residents of Austin, being prominent business men and practical miners. The machinery is being placed on the mine now, and we have no doubt but the labors of this company will be largely rewarded.

Two years ago W. J. Chamberlain & Co. of Denver, Colorado, erected sampling works on the railroad, six miles northwest from Austin, at Leslie Junction, under the management of W. E. West, which have contributed largely to the mining interests of both Lander and Nye counties, and should Congress be induced to enact any legislation favorable to silver, with the mines and appliances that Lander county has been given by nature, science and pluck—that pluck which is characteristic of the pioneer and miner all over the western coast, soon Old Lander would be that paradise for the miner so familiar from 1863 to 1878.

THE ANTHRACITE MINES.—It is interesting to iron workers to know that the present capacity of the Pennsylvania anthracite coal region will allow of an output of about 1,000,000 tons of coal per week; but for some time past less than half that amount has been mined, and once quantity terrible destitution exists among the miners. There are more miners than there is work for, even with a full output.

The Deep Gold Placers of California.

NUMBER VII.

[Written for the Press and Copyrighted 1890, by HENRY G. HANES, F. G. S. A., F. G. S.]

Elevations of Mountains and Geological History of the World in Brief.

In explanation of my theory, we must trace back the history of the earth as far as our limited conception can comprehend it; for it is utterly impossible for the human mind to realize the period of time over which the earth's history extends.

We must admit the creation of matter by an intelligent being, or assume it eternal and governed by laws also eternal.

The modern science of chemistry has taught us that matter is governed by fixed laws, the operation of which causes the incessant change upon which our existence is dependent. The idea of matter in perfect repose is inconceivable. Were there no elements there could be no compounds, no changes, and consequently no universe, no solar system, no life.

If we accept the nebular hypothesis, we may revert in imagination to a period when all matter now entering into the composition of the solar system was in an attenuated, gaseous state, which, condensing slowly, gave birth to the sun and planets as we now know them. During the period of evolution, elements reacted on each other to produce all mineral substances known and unknown. During the cooling of the earth (the only planet near enough to be examined closely by us) it was condensed, partly fused, shattered and patobed a multitude of times; the surface wrinkled and pliated, jagged and again. The mountains so formed, eroded by creeping ice and washed by rivers that no longer exist, were carried to oceans the beds of which now lie on the highest mountains.

Sediments in vast quantities, the ruins of the first formed crystalline rocks, augmented by animal and vegetable remains, were elevated and depressed many times, denuded and again river-washed to other ocean-beds, until a vast network of rocks was constructed, so numerous and so different in composition as to bewilder the most skilled lithologist of the present time.

The elevation of mountains assumed to be caused by the contraction of the earth's crust, was exemplified at the International Geological Congress, held at Paris in 1878. A common toy balloon was inflated and coated with wax; as the air or gas slowly escaped through the pores, contraction caused the wax to break and rise in ridges bearing a marked resemblance to chains of mountains. I have repeated this experiment in San Francisco with like results. It is easy to realize that similar contraction would cause great tension in a sphere as large as the earth. In rocks yielding to such a pressure, depressions as well as elevations would result; the contraction would not only cause fissures of greater or less magnitude, but the pressure changed to heat would create volcanic and solfataric energy. The same erosion, lake-bed excavation, formation of howlers, gravel and pipeclay, and other geological phenomena, have been, are now, and will continue in operation in many parts of the earth.

From a geological standpoint we may infer that these changes will eventually result in matter returning to its nebulous state to be created again as before.

All this is of great interest to the geologist, but it is the gold in the bedrock channels that make their origin interesting to the world at large, and to the people of California in particular.

The former theory that the deep-river channels on the sides of mountains and hills are wholly the work of the running stream, has been greatly modified in modern times. Since geology, by evolution, became an important science, it has been conceded that other forces acted in concert, some continuously and others at intervals, and that ice has been an active agent in mountain sculpture.

Hutton and Playfair maintained that all valley erosion was the work of rivers. Bakewell believed that elevation by subterranean forces would naturally leave an uneven surface down which rivers would afterward flow. Without elevation there could be no torrents. No river can erode a deep channel without placing its debris at some lower level, the position of which may be known.

Mr. Faray, an English geologist, advanced a theory that the surface of the earth was broken and deluged by the near approach of a comet.

There must be something fascinating about this theory, for it has been referred to by numerous writers. Donnelly, in his work "Ragnarok, the Age of Fire and Gravel," has assumed it, and attributes the gravel to the falling to the earth of comical matter from a comet's tail; but it would be difficult to convince a geologist that quartz howlers containing gold, and a till composed wholly of quartz, can be ultra-terrestrial.

Another theory by Pallas and Sir James Hall supposes a succession of inundations in the nature of tidal waves caused by earthquakes. Hall's theory assumed that if a sudden upheaval of an island as large as Sumatra should take place, a resulting tidal wave might lift glaciers from mountain-tops and place them in such a position that the melting ice would spread the drift on the surface as we find it.

The words denudation and erosion are used by geologists to imply the wearing away by natural causes of elevated portions of the earth's crust, and the placing of the debris in depressions. The effect of this, if sufficiently

Fig. 8.—SEMI-CUBICAL ANTARCTIC ICEBERG.

long continued, would be to reduce the earth to a more perfect sphere and thus render it inhabitable; for the water would then cover the land, forming a universal shallow ocean. Subterranean energy, however, prevails, which again breaks the surface. The operation of these opposite forces causes phenomena the study of which is the science of geology.

The erosion of mountains is a favorite theme not confined to geological writers. The following is quoted from Cox's "Travels in Switzerland":

"What a chaos of mountains heaped upon one another, a dreary, desolate, sublime appearance. It looks like the ruin and wreck of a world."

The denudation of the highlands is a vast concentrating process, yet similar to the operation the gold miner performs in his humble pan. Heavy substances assume one position, light ones another. Thus magnetite, which at

forms; when, during a period of elevation, mineral veins fill accidental fissures, thermal waters gather from the fertile well-rocks the metalliferous minerals they contain and place them between the walls. Before flowing water can act on the rocks except superficially, they must be reduced to a pulp or at least crushed or coarsely pulverized.

There are numerous agencies engaged in the work of denudation, some continuous, others intermittent, but the principal ones are as follows, minor ones being disregarded:

(1) Glaciers, (2) landslides, (3) avalanches, (4) cloudbursts, (5) rivers, and waters in motion, (6) changes of temperature.

Glaciers.

To those who have no knowledge of the peculiarities of a glacier and are not familiar with the conditions under which alone one can exist, a brief description of them will be necessary before the theory advanced in this paper can be fully understood.

The reader must be prepared to take a broad view of the subject, and to admit that there is no condition of absolute rigidity in any form of matter with which we are acquainted. Fluidity and rigidity are comparative terms. Hardened steel and the most indurated rocks are to a certain degree fluid. This fact is strikingly apparent during an earthquake, or when one stands on the top of a slender stone column like the London fire monument, in a high wind.

But pliability and fluidity pertain to some forms of matter in a greater degree than to others. A scale of substances might be selected to illustrate these properties increasing in rigidity by successive steps, as oxygen, rhigolene, ether, alcohol, water, oil, molasses, tar, asphalt, and so on to the hardest rock. It is a singular fact that some substances so hard that they fly in fragments under a quick blow of a hammer, may be plicated with ease by slow movement. As an illustration of this the reader is referred to the confectioner, who breaks soft candy by gentle but quick blows of a small hammer.

A mass of common asphalt laid on a table in such a manner that a considerable portion projects, will very gradually bend at a right angle and soon commence flowing in an attenuated stream which will continue until all the projecting portion has piled up on the floor in the form of a bituminous stalagmite. If the tarry threads are taken in the hand they will be

is probably more common than known, might produce effects similar to those of a true glacier, or at least do its part in that direction.

The earth glacier is in no sense an avalanche or landslide, both of which sweep down the mountain-side expending their energy within a few minutes of time, but is a slow-moving mass of loose earth on an inclined bedrock; the lower portion being gradually removed by various causes, the mass with relentless force seeks a lower level, crushing and grinding yielding rocks in its path.

The following quotations from the Second Annual Report of the State Mineralogist, 1882, describe an instance of this nature I observed in Butte county, near Oroville:

"On reaching Morris Ravine I witnessed a strange sight. Here was a moving mass of earth miles in extent, governed in part by the same laws which apply to glaciers. When Hon. W. C. Hendricks commenced hydraulic mining in the stream ravine which has been singularly rich in gold, he met with snags. As he progressed, he noticed certain singular phenomena for which he could not account. On one portion of the claim the ground was found to have risen, while it had sunk on others. While piping to remove the auriferous earth, he did not seem to progress, or to uncover the bedrock to the extent expected, when at last it occurred to him that the ground was moving slowly forward, in proportion as the earth was removed by the powerful hydraulic stream. When he fully realized this, he watched more closely and found it to be a fact. Strange as it may seem, here we have many of the conditions of the glacier, but the yielding mass of matter is earth instead of ice. The gravelly deposit lies on a sloping bedrock the inclination of which is not great enough to produce a landslide, but sufficiently so to cause the flow, so to speak, in the direction of the least resistance, and this wonderful earthy glacier (if such a term is admissible) has crawled forward for years, and although the motion is invisible, it still continues and will continue until it reaches a point of equilibrium. While this is an interesting geological phenomenon, it has proved a great misfortune to Mr. Hendricks, who can see no hope of profit in washing away the surface soil, containing but little gold, which is replaced as fast as he can remove it. Here is a striking instance of the fact that common earth and rocks yield to the force of gravitation and pressure and move for considerable distances without the assistance of water, and without being fused as in the case of lava. This locality will become an interesting one to the geologist, and should be more carefully studied."

Another instance was observed in Cajon Pass, San Bernardino county, by Mr. Frank Kimball of National City. At the bottom of a railroad cut, the workmen came to a thin seam of very plastic clay, inclining toward the opening. As fast as they removed the earth at this point, the mass slowly descended like a ship on greased ways toward the water. It required the expenditure of much labor and capital to overcome this unexpected difficulty.

The following is from a recent newspaper: "DUNSMUIR, Feb. 7, 1890.—The supply train of three engines and a box car full of provisions has just arrived from below. The goods were carried over Tunnel 9. Roadmaster H. Cooley said it will not be possible to clear the slide at Tunnel 9 inside of two weeks. The whole face of the mountain has slid down, and as fast as the rock is removed, more slides in to take its place. This is the only serious obstacle below here. A slide from 10 to 20 feet deep and 100 feet long, full of trees, obstructs the track a mile above here."

Plasticity is possessed by ice to an eminent degree. A block of ice laid across a tightly stretched wire will be slowly cut through; the ice regeling as it passes the wire, and instead of being divided into two portions, it will remain seemingly a perfect block as before.

Geography and History.

What has been named by geologists the "Ice Age" was a glacial period, during which a sheet of ice extended over a large part of Europe and America. It is probable that this was owing to a gradual change of the poles of the earth. It is believed that there have been many ice periods, only the recent ones having left traces. The glaciers of Europe are supposed to be the remains of the vast ice sheets of a nearly extinct glacial period. This vast accumulation of congealed water was of varying thickness. In Norway it was 600 to 700 feet in depth, and 300 feet in the Scotch highlands. I have myself seen, far south of Cape Horn, ice islands floating in the sea which were broken from the end of a present ice sheet of the same character extending to the sea level as in the arctic region, but the bergs differ in form and magnitude from those of northern seas. One of these enormous semi-cubical antarctic icebergs has been figured by Geike and is reproduced here (Fig. 8).

According to Dr. Wilson (Annual Report Geological Survey of Canada, 1886), the Straits of Georgia were once occupied by a vast glacier, which would dwarf those of Switzerland. The glacier had a width of 50 miles. At its northern end its thickness was 3000 feet, and at its southern extremity 700 feet. Another glacier of similar area occupied Queen Charlotte Sound. There are living glaciers of great magnitude on both sides of the Stikine river which are of great interest. The glaciers of Alaska are on the grandest scale, but they have not been as carefully studied as they deserve.

(Continued on page 353.)

Fig. 9.—THE MUIR GLACIER FROM THE MORaine.

one time was disseminated in the crystalline rocks, forms beds of limonite and other as we find and utilize them. So the lighter matter, after giving up its alkali to water, becomes clay and argillaceous shales. Quartz, liberated by decomposition of granites, assumes the form of sand and sandstone, and still associated with mica, yields mica schist and gneiss. The accumulations of corals and marine shells in the seabeds produce limestones and dolomites. These are a few examples as an illustration of the many known to the geologist.

Fine sedimentary silts, under great pressure caused by contraction, become slate, having sometimes vertical cleavage, although deposited in horizontal strata.

The waters of the sea, into which nearly all land streams flow, gathered soluble salts from decomposing earthy minerals, which were in part precipitated by superaturation, and returned to other forms to the sediments which eventually became rocks of a different character.

These new composite rocks contain many elements and compounds in ever-changing

found as hard as the original. This is given as an illustration, but all known substances without exception possess this property to a greater or less extent.

In the streets of San Francisco the bituminous pavements afford an interesting object-lesson for study; the ever-creeping asphalt may be seen to possess properties similar to those above mentioned, and to be governed by the same laws that set the glaciers in motion, and thereby produce remarkable geological changes. Although on a cold day this material will break like glass if struck with a hammer, on a warm one, although in a literal sense solid, it will slowly flow down any accidental decline and overflow the glass dead-lights in the sidewalks, the surface assuming a corrugated appearance, resembling in miniature the fissured surface of a glacier.

Earth Glaciers.

While this term is manifestly incorrect, it is not easy to find a more suitable one, and it must serve its purpose to convey the meaning intended. This geological phenomenon, which

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

KENNEDY.—*Ledger*, May 17: This mine is looming up as one of the strongest and most prosperous mines in the county. The last sinking shows the ore body to have widened out to splendid proportions, and if it continues to expand below the present depth in the same ratio, the Kennedy will rank as one of the foremost gold-producers of Amador. The rock is of excellent grade; the last cleanup, so it is reported, surrendered over \$40,000.

SAVING SULPHURETS.—Mr. Gates has secured the right from the Kennedy Mining Co. to erect sulphurets and gold-saving apparatus below the Kennedy mill, for the purpose of working the tailings. He pays the company \$50 per month for the right, and also a small rental to the owners of the Volunteer, as some of his works will overlap that claim. He is now at work placing his apparatus in position. It is a simple method, and will consist chiefly in running the tailings over canvas-covered boxes embracing an area of nearly 3000 square feet. Mr. Gates formerly caught sulphurets on the same plan at the Governor mill. He also erected similar works at the Hathaway mine, Placer county.

MISCELLANEOUS.—R. B. Reed, of the Reed & Askey mine, returned from a long visit to S. F. a few days ago. He reports having succeeded in disposing of a sufficient interest in the property to enable him to surmount all monetary embarrassments. He expects the parties up shortly to look at the property and close the bargain. The Amador gold mine has finally disposed of the dispute regarding the right of way over the Doyle ground. On Saturday they paid Doyle \$2000 for the privilege to allow the track to remain where it is, simply straightening it at the lower end if necessary. The suit pending in the U. S. Circuit Court to enjoin the company from using said track has no doubt been dismissed ere this.

Calaveras.

THE TONE QUARTZ MINE.—*Cor. Calaveras Chronicle*, May 16: This mine is situated one mile south of Dive Lampson's ranch, near the head of Nelson's gulch. The mine is owned by John Tone, a well-known San Joaquin county farmer, and French Miller, a miner of considerable experience. The ledge is tapped by a tunnel at a depth of 200 feet, which shows a well-defined lead of high-grade ore four feet in width. The ledge on the surface, as far as prospected, has a pay chute 800 feet in length. There is now a force of men building a hoarding-house and also grading for an 18-stamp mill, and soon will be running in full blast.

THE COLUMBIA QUARTZ MINE. owned by Messrs. Jones & McCormick, has resumed operations, but no sinking can be done, as the machinery on the mine is not large enough to handle the water. It is the intention of the owners to put new and larger machinery on the mine and work it in a business-like manner. This is a valuable mine, but owing to litigation among the former owners, has lain idle for several years.

El Dorado

LIVELY.—*El Dorado Republican*, May 15: The liveliest mining camp in this county is now in the neighborhood of the Taylor mine near Garden Valley. This mine is now in the hands of the Chapman Bros. of San Francisco, who are the owners of extensive drift mines in Sierra county. Under contract with the owners of the Taylor mine they have been sinking during the winter and erecting a fine mill on the property. The mill will be completed some time in June. It will have 20 stamps at first, but it is planned to contain 40, and the additional 20 will be added if the mine proves equal to the expectations of those working it. The shaft is down between 500 and 600 feet, and a large amount of ore has been taken out on the dumps. In places the ledge is 30 feet wide. The company has been at work all winter in spite of the inclement weather, and has a good reputation in the neighborhood, paying all debts promptly, we understand. The Esperanza, a mine in the same neighborhood, owned by N. D. Burlingham, is bonded by San Francisco parties who are sinking the shaft. This mine, like the Taylor, has a very large body of quartz which will employ a company many years if it is put on a paying basis.

TAYLOR.—*Georgetown Gazette*, May 15: Work is being energetically pushed at the Taylor mine, and it is a safe bet that the present company will develop it into a permanent and paying mining enterprise.

GOLD MINES.—Our gold field will receive more attention from mine-hunters this summer than for many years past. Paying gold mines can always find a purchaser and such properties can certainly be found here.

Inyo.

BORAX.—*Inyo Index*, May 14: The works at Searles' marsh are turning out the usual quantity of that salt. John W. Searles, superintendent and principal owner of the property, is making constant improvements in the works and processes of manufacture in use, whereby he has been able to economize both labor and the raw material and also produce an article of superior excellence and the highest commercial value, the refined borax from this marsh commanding extreme prices on the London market. The outlook for the borax industry on this coast is now considered good.

PANAMINT.—*Inyo Index*, May 11: Reaching Panamint, Dr. DeGroot reports more life in the business of mining, and this, for the reason that the conditions are more favorable. Not until this point is reached is any wood met with, the mining districts for a hundred miles south until Black Hawk is reached being absolutely treeless, as well as deficient in water. Striking Panamint, the pinyon begins to come in, water also being more plentiful, both increasing somewhat as we come north. The strike recently made in the Minnieta mine at Lookout, Dr. DeGroot considers to be one of great importance, the ore being of good grade and the find being marked by features of permanence. Although there is no notable activity at Darwin, mining there is in a healthy condition, much high-grade ore being extracted and shipped to Keeler, the greater portion being consigned to the Selby Lead and

Smelting Works at Selby, near San Francisco. The character of the mines here and the districts adjacent is sufficiently denoted by the wages paid miners, the regular rate being \$3 50 per day, from 50 cents to \$1 per day more than is paid generally throughout California, or anywhere else on the coast except in the Comstock mines. With the improved prices of silver and lead a prosperous future evidently awaits the mining industry in this section of California.

CERRO GORDO.—*Inyo Index*, May 14: John Anton came in from Keeler on Tuesday. Cerro Gordo is bound to come to the front at an early day and it is intimated that not less than ten carloads per week will be the early ore shipment from that camp alone. The Union Co. is hiring men as fast as they come along, and rumor says that the Dunphy & Keefe mine has been bonded, if not purchased, by Nevada capitalists.

Nevada.

IDAHO MINE.—*Grass Valley Union*, May 17: The drift in the new ore body recently found on the 17th level of the Idaho mine has been extended a distance of 60 feet, and crosscuts have been run at several points to determine its width. As the work has progressed, seams of wall rock have been found between the layers of quartz, and the indications are that the pay ore may run out in no great distance. On the floor of the drift, however, the vein holds strong and has the appearance of going down, and even if it gives out in the drift the sinking of a winze may prove it goes down, and be as strong in size and prospect as well as it has been doing for several weeks past. Appearances are that the ore body is taking a westerly dip, which, if correct, would bring it nearer the shaft in sinking another level. It will necessarily take some time to obtain definite information of the extent or value of the discovery, but so far it has prospected remarkably well.

HARTERY.—The water in the Hartery shaft has been lowered to the drift below the present working level, and it is proposed to open the level on which but little work has been done heretofore. The shaft is sunk to another level below this, but the ground has never been opened. The present working level is No. 2 below the adit level, where the vein is showing about two feet, and the ore of a good milling quality. The shaft of the North Star mine is to be sunk to the 20th level with as little delay as possible. The work of putting the Gold Hill mine in shape for regular operations has been commenced in good shape. Good progress is being made in re-tilting and pumping out the Homeward Bound shaft. There is a good deal of water in the ground, but the pumps are making headway against it easily. It is contemplated to commence the sinking of a shaft on the Wisconsin location forthwith. This claim parallels the Homeward Bound, and is a portion of the Menlo property. It produced rich ore in former times, but has not been worked in many years.

RIDGE ITEMS.—*Nevada Transcript*, May 17: There are rumors that efforts will be made before long to reopen the very extensive gravel claims at Cherokee (Patterson postoffice). There will be no infraction of Judge Sawyer's anti-debris decisions, but the drifting process will be pursued. The Cherokee claims include about 400 acres of as good-paying ground as has ever been opened. Once in operation, they would give employment to a large number of men and sustain a community of thousands. The stretch of country from Badger hill to Cherokee, two miles or more across, is one vast bed of auriferous gravel, every rod of which will pay for working. The matter of devising ways and means of working these claims is now under consideration by some well-known mining men, and will hear good fruit in the near future.

DELHI.—Now that the snow is all gone, the Delhi mine near Columbia hill is being worked to the full capacity of the mill. It is the only quartz mine of consequence on the ridge that has yet been developed to a regular operating point. There is nothing too difficult in the way of mining for Robert McMurray to tackle. The resumption of work at the Delhi mine, of which Mr. McMurray is principal owner, makes matters lively at Columbia hill, where most of the employees reside.

BOSS.—The Boss quartz mine near North San Juan, owned by Messrs. Crane, Gaynor, Buhning and others, is again being worked. The rigors of the winter caused a suspension of labor there, but now the main shaft is being pushed down again. It is down some 80 feet. It is the intention to sink on the lode as far as is possible with the facilities available in order to thoroughly test the character and value of the formation. The owners are confident the mine can be made to pay.

JERSEY SLIDE.—Across the Middle Yuba river, at a point known as the Jersey Slide ground, George Archer & Co. are running a long tunnel into the hill for the purpose of striking, if possible, the channel of an old river which must at one time have been the outlet of a very large stream, but which, through some great convulsion of nature in the dim and misty past, slid off. The south part of the old slide was worked 30 years ago by a company known as Van Ness, Taylor & Co., who in a short time took out many thousands of dollars, but soon exhausted the gravel. Since then other parties have worked farther into the hill with varying results. Finally a few years ago George Archer, J. S. McIntyre and another party whose name cannot be recalled just now relocated the ground. They did well for a while. Recently Archer got entire control and is now working there. His prospects are good. The claim is worked by ground-sluicing. At Sweetland the bedrock of the old Manzanita claim is being worked, giving employment to quite a force consisting principally of young men.

NEW SHAFT.—*Tidings*, May 17: Supt. Wiltsie to-day instituted work on a new shaft on the Wisconsin ground, embraced in the Menlo property. Surface workings on this ground in the early days yielded richly, but nothing has been done since 1859. It is expected to find good ore at a depth of 75 or 100 feet. A 12-inch combined pumping and hoisting engine will be placed on the shaft.

HOMEROUND BOUND.—The work of cleaning out the Homeward Bound shaft on the same property is progressing very satisfactorily, and Mr. Wiltsie is showing himself well qualified to cope with all emergencies. His decision and prompt action in connection with the work on the Wisconsin ground certainly stamps him in addition as being a man of energy and determination. The operations of the syndicate represented by Judge Calkins of Chicago have commenced in earnest. The tunnel on the

Lafayette No. 2 is being reopened, and machinery and lumber for the Ben Franklin are being hauled and the work of erection forwarded.

NEW MINES.—Our people do not fully realize that work is progressing on nine new mines in this district, viz.: Gold Hill, Peabody, Emmett, Evening Star, Menlo, Crown Point, St. Johns, Lafayette and Wisconsin. The Idaho could not be more full of promise; from 50 to 100 additional men will be put on at the Empire before long; the Omaha and Lone Jack is prosperous, and the North Star will soon be paying dividends again; the W. Y. O. D. never looked as well as now; the Coe will not long remain idle; the North Banner gives more promise than ever of proving a great mine; the Pittsburg, also tributary to Grass Valley, is looking very well; developments are being pushed at the Hartery and half a dozen movements to open old and new mines are on foot. Work has been resumed on the Brunswick, and the Gold Point will soon start up. The outlook in this richest of all quartz districts has never before been so pregnant with promise. It is rumored on the ridge that the 400 acres of hydraulic mining ground at Cherokee is to be opened by the drifting process, and it is stated that the work will certainly pay. The indications are that the new ledge in the Idaho, which has been opened upon for a distance of 60 feet, has taken a western dip, which will bring it nearer to the shaft in sinking another level.

Placer.

MAYFLOWER.—*Placer Argus*, May 17: Mr. Chappellet says that the Mayflower M. Co. have paid out over \$1,000,000 at Forest Hill, during the last 13 years. The hullion yield has been over \$600,000, but the work in developing the mine is pretty well completed. The mill will soon resume work, as pay gravel has been struck in the south drift.

THE DRUMMOND.—*Herald*, May 17: Mr. Wm. Werry, the well-known quartz-miner, in conversation with a representative of this paper stated that he had resigned his position as superintendent of the Drummond mine, owned and operated by Hon. F. Reed, and that Mr. Hanchett, a man of large experience in the management of mines in the States of Nevada and Colorado, has been employed as his successor. Mr. Werry spoke very flatteringly of the comparatively new mine. He said: "In leaving the Drummond mine I left one of the leading mines in the State. It is bound to be a very large producer of bullion. While the ore is not of a high grade, there is an immense body of it, the vein being large and very extensive. It is another Idaho; like the Idaho of Grass Valley. When I first took charge of the Drummond the ore paid only \$2.70 per ton, and when I left the value of the ore would average about \$8 per ton. The mine paid under my administration, with one Huntington mill, all expenses of opening and a little surplus, and with two mills it ought to pay a handsome profit, ore enough being in sight above the No. 1 tunnel to run two mills for three years to come, crushing 40 tons per day. During the time I had charge I run another tunnel, or crosscut, so as to tap the vein still lower. This lower tunnel is called tunnel No. 2. Enough ore can be taken from No. 2 to run the two mills three years. Crosscuts can be run below No. 2 to tap the vein at a depth of 1200 feet. I regret that other enterprises in which I am interested seemed to make it necessary for me to resign, but I have faith in the ability of my successor. About 1000 feet from the Drummond ledge is a parallel vein running east and west—the Drummond ledge running south of east and west of north—and I am confident that the two ledges will come together, thus forming a very large body of ore. Very rich rock has been taken from the second lode on which but little work has been done as yet, proving conclusively this of itself is a big mine. This parallel lead is called the Eclipse, also owned by Mr. Reed. Specimens of ore from the Eclipse can be seen at Freeman's hotel, which were taken from the bottom of the shaft at a depth of only 80 feet. The mills are now run by steam, but can be run by water-power if necessary, which shows that these mines can be handled very economically. In conclusion let me tell you that the size of the ore body, its quality, the surroundings and conveniences for working make it another Sierra Buttes mine in location and production."

Shasta.

WAGON-LOAD OF BULLION.—*Shasta Courier*, May 17: We once described the Lost Confidence mine on Iron mountain near town as a vast crucible filled with silver and gold ore. The results obtained in working and prospecting the mine so far carry out the correctness of our designation. Yesterday our attention was called to a two-horse wagon-load of silver bullion brought down from that mine, en route for shipment to San Francisco for refinement and sale. The load consisted of 20 bars of silver bullion, pretty well refined, and aggregating 2500 pounds in weight. This we learned was the result of one month's run of the Lost Confidence mill. We think one ton and 500 pounds over of bullion is a pretty good month's run, and a good showing and indication of the mineral wealth of Iron mountain.

Siskiyou.

GOLD.—*Yreka Journal*, May 15: The miners at Hawkinsville are taking out considerable gold-dust lately, in having a good supply of water from the Big Ditch, now bank full all the time. The other ditches on Yreka flats are also furnishing an abundance of water, so that every claim on Greenhorn and Yreka flats to Hawkinsville can be worked to the best advantage. John Boyle of the Humburg quartz mines had his mammoth and ponderous quartz-wagon on our streets last Saturday, taking it over to Humburg for hauling quartz to his new Huntington quartz-mill, almost in readiness to start. Spencer & Co. of Humburg creek are now engaged in getting out quartz and bailing it to the McCook mill at Forks of Humburg. The Heckathorn quartz from Greenhorn, now being crushed at the Warren quartz-mill, on Yreka flats, is expected will pay at least \$17 or \$18 per ton, provided some rich specimen quartz has not been overlooked, as a very little of such quartz would run the average up to \$30. The owners of the mine always take out the specimens showing gold to the naked eye, for pounding out in a band mortar, to pay running expenses while waiting an opportunity for milling. The Quartz Hill Co. at Scott Bar will soon lay a water pipe across Scott river, for running their quartz mill, the former water pipe having been carried away with the Scott river bridge, during the

winter flood of last February. It will be laid across the new bridge. Schroeder & Werner of the Deadwood creek quartz mines have a force of men busily engaged in fixing up the wagon-road from their mine to mill, which was badly washed out by the flood of water last February. The snow is about all gone where the sun's rays could strike, but there is about five feet still remaining in the shady places, and where sheltered by groves of trees. These enterprising miners expect to have their mill in operation within ten days, and believe they will do better this season than ever before.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Chronicle*, May 17: On the 030 level a southwest drift is advanced 591 feet from the shaft station. Formation, clay and porphyry carrying water.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 398 feet, continuing in porphyry now showing some water.

MEXICAN.—On the 1465 level west crosscut No. 4, 100 feet south of No. 3, from the north drift from west crosscut No. 1, from the main north lateral drift, is extended 255 feet and stopped.

OPHIR.—On the 1300 level in working southwesterly from the top of the raise carried up 28 feet above the south drift from the end of the east crosscut from the shaft station, following the ore streak found in the raise downward, 27 tons of ore were raised to the surface, the average assay value of which is \$24.50 per ton.

CON. CALIFORNIA & VIRGINIA.—The 1300, 1500 and 1600 levels continue to yield the usual quantity of ore. During the week extracted 2753 tons and 540 pounds from the above-mentioned points, all of which have been shipped to the mills. Shipped to the Morgan mill 1138 tons and 680 pounds of ore and to the Eureka 1624 tons and 1860 pounds; battery sample assays showing an average value of \$22.75 per ton; [2881 tons milled.] Bullion valued at \$12,840.70 shipped to the Carson Mint, and about \$30,000 on hand in local assay office.

BEST & BELCHER.—On the 1000 level the north drift is cleaned out and repaired 688 feet.

GOULD & CURRY.—On the 400 level the north-west drift from west crosscut No. 1 is extended 50 feet. Formation, hard porphyry with small streaks of quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels. The 650 level main north drift is extended 10 feet through low-grade quartz.

ANDES.—A 420 level west crosscut 160 feet north of the shaft is in 20 feet, continuing in clay and quartz seams in the face. The 350 level west crosscut is extended 227 feet, the face still in porphyry.

SAVAGE.—Shipped 450 tons of ore, showing an average value of \$23.10 by battery sample assays. The raise above the 750 level has connected with the 650 level workings.

HALE & NORCROSS.—A 500 level east crosscut is advanced 166 feet, and continues in porphyry and quartz. Shipped 1070 tons of ore during the week, showing an average value of \$19.60 per ton by battery sample assays.

WARD COMBINATION SHAFT.—The 1800 level east drift is out 350 feet; the face continues in porphyry.

CHOLLAR.—Extracted 462 tons of ore, battery sample assays showing a value of \$21.40 per ton.

POTOSI.—On the 930 level the winze is down 110 feet. The bottom is in porphyry with bunches of quartz. The raise above that level is up 145 feet. The roof is in porphyry.

ALPHA.—The 600 level east crosscut is in 82 feet and continues in porphyry. The 600 level south drift is out 61 feet, the face in clay and porphyry.

EXCHEQUER.—The 600 level north drift is out 287 feet, and continues in quartz and porphyry.

CON. NEW YORK.—The 650 level west drift continues in low-grade quartz. The 960 level south drift is in low-grade quartz.

IMPERIAL.—The 750 level west crosscut No. 3 is in 99 feet, the face in low-grade quartz.

YELLOW JACKET.—Shipped 500 tons of ore showing average assay value of \$21.75 by battery sample assays.

KENTUCK.—Still sinking the winze below the 950 level.

CROWN POINT.—Shipped during the week 809 tons of ore, showing an average value of \$20.99 per ton by pulp assays.

CONFIDENCE & CHALLENGE.—The raise above the 300 level has connected with the 200. The top is in low-grade quartz. The joint Imperial 800 level west crosscut No. 1 is in 218 feet, the face in soft porphyry. The joint Imperial raise above the 500 level is in low-grade quartz.

BELCHER.—The 200 level south drift is out 318 feet and is in porphyry and low-grade quartz. The 300 level west crosscut is in 195 feet, the face in soft porphyry. The 850 level joint east crosscut is out 431 feet, the face in soft porphyry.

SEG. BELCHER.—The 850 level Belcher joint east crosscut is in 431 feet, the face continuing in soft porphyry.

JUSTICE.—During the week crushed 198 tons of ore, showing a value of \$26.25 per ton by battery sample assays. The raise above the 622 level continues in low-grade ore.

ALTA.—The ore output this week was 320 tons, showing an average assay value of \$22 per ton by pulp assays.

OVERMAN.—Shipped 328 tons of ore during the week showing an average value of \$23.41 per ton by battery sample assays, of which \$14.13 was gold. The northwest drift continues in low-grade quartz. The incline winze is down 28 feet below the 1200 level. The ore in the winze is mixed with porphyry.

Cottonwood Canyon District.

THE CAMP OF SANBORN.—*Central Nevadan*, May 16: Sanborn is located in what is known as Cottonwood canyon, but in early days was known as Anderson creek. The Lucky Dog, or Hope mine, as it is now called, is 1700 feet above the town of Sanborn, at an angle of 40 degrees. The superintendent has ordered a tramway to carry the ore from the mine to the mill. The mine will produce from 40 to 60 tons of ore ranging from \$20 to \$50 per ton and often ore of a higher grade. The mine is under the management of Wm. Woolcock, said to be one of the best miners in the State. The mill is under construction, it being two four-foot Huntington mills,

our pans, two settlers, two concentrators with plates for gold, the ore carrying from \$6 to \$36 to the ton in gold as per assay. Good judges of machinery claim that it is one of the finest mills ever brought to Nevada, outside of Virginia City. The superintendent, D. N. Brown, expects to have the mill running in the month of July. The camp has quite a lively appearance. Friday, May 2d, was the company's first pay-day. They commenced operations about April 2d. They distributed \$1200. Altogether the prospects are flattering, and we believe it will be a successful and a good purchase for the Michigan company.

Buena Vista District.

THE ARIZONA.—*Central Nevada*, May 16: The new mining district is situated in the southeastern part of Humboldt county, about four miles south of Unionville. Here in Buena Vista mining district are located some of the best mines in the State, and the once-renowned Arizona mine, that has already yielded \$7,800,000, is again coming to the front. Here also are the Huascar, Peru, Jackson, Millionaire and other first-class lodes that need only capital to make them paying properties in a very short time.

Central District.

ORE.—*Silver State*, May 16: Charley Wright arrived from Central District last evening with a lot of ore from the Millionaire mine, which is being worked by A. H. Ruse. The ore is rich in gold and silver, and will be shipped to Argo, Colorado, to be worked.

Jumbo District.

CRUSHING ORE.—*Virginia Chronicle*, May 14: The Dunlop stamp mill in Jumbo district has been crushing ore from the Wild Goose mine since last March and a cleanup of gold bullion will be made in a few days. The blizzard location in that district is being worked by the owners, Messrs. Woods and Willis. The Pandora is also producing ore and the Josephine and other locations are being prospected.

Red Mountain District

GOLD QUARTZ.—*Virginia Chronicle*, May 14: A vein of gold-bearing quartz has recently been discovered in Red Mountain district, about 12 miles north-east of Six-mile canyon. The vein lies in burned volcanic rock, on the mountain from which the district derives its name.

Reese River District.

THE PATRIOT MINE.—*Reveille*, May 13: The Patriot Mining Co. begin pumping out the water from the mine to-morrow. Everything in and around the hoisting works is in perfect order, and a trial has been made of the engine and pump, which were found to work most satisfactorily. Seventy-five cords of wood have been provided which will be more than enough to get the water out, the estimated time for which work being from 20 to 40 days. P. T. Farrell, S. Buddel, T. George and A. Blight move out to the mine to-day. J. Rowe will reside in town for awhile, going out daily. All parties interested in this mine are sanguine of success, and we sincerely hope they will not meet with any disappointment. The Patriot mine has yielded something like \$200,000 from the upper levels, and as there is known to be good paying ore below, it is fair to presume that no one interested will lose anything on the venture.

ARIZONA.

BRADSHAW MOUNTAINS.—*Journal-Miner*, May 14: The Crowned King mill is having a long and successful run. The fine stamp and concentrating mill of the Oro Bella Company is running almost constantly on ore from the well-known Gray Eagle mine, which the company recently purchased. Under the direction of Supt. Helm, the mill is doing excellent work, nearly all the gold and a high percentage of the silver being saved. Less than \$1 in gold is left in the tailings, and one day last week assays failed to show that even a trace of the precious metal was lost. Large quantities of ore are already opened up in the mine, and a substantial three-rail gravity tramway is being constructed from the mine to the mill. The 20-stamp mill of the Ryland Gold M. Co. is running steadily, and the company's mine is yielding vast quantities of low-grade ore in the lower workings of the mine, it is reported. Ex-Sheriff Henkle is running a crosscut in his Rapid Transit mine, which is expected to soon strike the rich ledge, which he has already opened by several hundred feet of tunnel. The important development of pay ore in the Del Pasco property, formerly owned and abandoned by Diamond Jo Reynolds, is very satisfactory to the finders, Messrs. Bashford & Burmister, and shows the possibilities of mining. It is understood that the results of experimental work on an extension of the old Tiger mine were not such as to encourage further development.

COLORADO.

A CAMP BIRD STRIKE.—*Aspen Times*, May 13: An important strike has been made in the Lever lease on the south end of the Camp Bird. Ore has been found before in this lease but it has either been low grade or small in quantity. Now, however, the mine is showing 6 feet of ore that will average close to 75 ounces per ton.

THE FLOODED MINES.—Nothing new has developed in connection with the flood in the mines on the lower part of Aspen mountain. Sunday the water lowered 12 feet in the lower levels of the Aspen Mining & Smelting Co., having found a fresh outlet into the Enterprise. Monday it rose again and was soon several feet higher than it had been before. The flow appeared to be much heavier on Monday than it had been before. It was expected that the flood would soon find an outlet into the Little Nell and Juniata and that those properties would be completely submerged.

A \$51,000 PAYMENT.—*Manager Dunbar* Wright of the Park Regent mine will to-day pay for A. W. Hawkins to Henry Devereux \$51,000 to apply on the purchase of Mr. Devereux's interest in that mine. This property is producing about \$3000 per day and has about four-fifths of its territory yet unexplored, after having produced over \$1,000,000.

THE BUSHWHACKER.—The regular daily shipments of ore worth from \$500 to \$800 are kept up from the Bushwhacker mine. The proceeds of ore sales and stock sales has enabled the company to pay off some \$30,000 of claims during the past month. Manager Yankee returned from Denver yesterday, and will immediately assume personal

management of the development of the properties of the company.

NOTES.—A 10-ton lot of ore has been brought down from the Monte Cristo on Maroon creek. It is expected to run about 35 ounces silver and 25 per cent lead. A late telephone message from Manager Fore of the Little Rule, states that the recent discovery is looking better and better and work progresses on it.

DAKOTA.

ORO FINO.—*Deadwood Pioneer*, May 14: The Messrs. Swift, to whom the Oro Fino is bonded, will accompany J. K. P. Miller on his return to Deadwood and with him are due to arrive here on Friday or Saturday of this week. The gentlemen come to personally examine the property, and until their arrival stamps in the mill will continue to drop. Whether or not they determine to buy, present operations are to cease early next week.

BUCKEYE HYDRAULIC.—*Spearfish Register*, May 13: G. A. A. Paul of the Buckeye hydraulic works came down yesterday after supplies. The flume has all been put in good working order and work at piping commenced Thursday. The boys have water enough to run steady, and propose to utilize it as far as possible. At present they are running two 12-hour shifts, which will be changed soon to three 8-hour shifts.

FLOAT.—Late reports from the Glendale tin mine and mill are that the mill is working satisfactorily, and the yield from the ore is reasonably good. The mill consists principally of a Gates crusher, Cornish rolls and Frue vanner.

IDAHO.

BULLION.—*Ketchum Keystone*, May 12: Ore shipments have begun from the Idahoan and one or two other mines in the Bullion region.

SAWTOOTH.—Encouraging reports come from Sawtooth and Germania Basin and shipments from those regions will probably exceed those of 1889 in first-class ore.

RELOCATORY.—A great many locations are being made on the northern end of the Camas granite belt, consequent from the strike in the Croesus. No sooner was the snow gone from old holes than the relocatory was on hand.

THE CARRIE LEONARD.—This mine is under lease, to parties who have recently struck some ore, causing quite a little excitement in that locality.

LAKE CREEK.—James D. Cochran came down from Lake creek Wednesday, having been at work on his old claim there known as the Argonaut, in the group of mines bearing the same name. Mr. Cochran is one of the many miners in this upper country who report their prospects looking much better than usual, and feel that the time for greater profit in working them is at hand.

GOOD PROSPECTS AHEAD.—*Boise Statesman*, May 16: Never in the history of the country have the prospects for a successful mining season been so bright as at present. Yesterday there appeared in the *Statesman* a partial account of the mines of Owyhee county, which for a long time was reckoned the richest in the country and stood very high among mining operations in New York City. Under such men as J. C. Kemp, Van Ee and Capt. J. R. DeLamar, who direct their efforts not to booming and selling so much as taking out the precious metals, there is no doubt but that the good old mine will return. The only drawback to the Seven Devils country has been the want of means of transportation. This has been obviated by the construction of a steamboat which will ply upon the waters of the Snake. The same means will also avail in developing the Mineral district. Washington county has many neglected mines, among which are several of mica, which will not long be allowed to remain idle. In Elmore the people are fairly impatient for the spring to open. The people at Rocky Bar anticipate a doubling of population over last year. Atlanta, one of the best mining districts on the Pacific Slope, expects to resume her old position as a queen among mining districts, while the tales from Neal sound like the adventures of Sindbad and the diamond cavern. Banner district will boom. Work will be pressed vigorously on the bedrock flume, and the various placers in and about the Basin, with plenty of water, will be worked for all they are worth. Where are all the workmen to come from? They will have to be imported. For the first time in many years there are not laborers enough in the country. Lloyd Sherman, from Salt Lake, says that efforts have already been made to induce men to come from Utah to Idaho for that purpose. The season has but just commenced and but few of the mines are being worked. As soon as the bulk of the snow shall have disappeared from the mining camps, the demand for labor will be increased. Idaho can support double the population it could three years ago because the mines are better developed and the soil is four-fold better irrigated.

LOWER CALIFORNIA.

ALAMO AND CEDROS.—*Lower Californian*, May 9: J. W. Perry returned Monday from a short trip to Alamo, during which he inspected most of the leading mines in camp. He said: "Compared with the deep mines of California, which penetrate from 500 to 2500 feet, Alamo is only a prospect. Its indications are all favorable for going down deep. Most of the veins strengthen with depth, and a fairly rich mine at 100 feet is reasonably certain to carry more gold at 200 feet. The very even formation and character of the country rock point to a steady going down of all the leading veins. Another thing, much of the ore pronounced rebellious is absolutely free milling, with perhaps the exception of a little sulphurets not worth saving. One of the mines presents rock at 60 feet that is the exact counterpart of certain quartz in Amador county that is perfectly free. I was kindly shown by Supt. Rodda over the Princessa Co.'s properties, and so far as developed they are certainly good. No one need exaggerate about Alamo—the truth is good enough at present, and if the development now going on is successful the camp will jump to the first rank; and then, too, the truth will be good enough. I think there are undeveloped parts of the Peninsula that will equal Alamo." W. P. Lyle, in charge of the Lucas mill in Mexican gulch, crushed 44 tons of Viznaga ore, finishing last week. Col. W. S. Kerr was here last week. His mill has been running steadily and

satisfactorily on custom ore. The El Paso mill is now running on Elsinore rock, which pays well. The Princessa mine is in pretty hard rock but manages to yield its share of gold. The Princessa Co.'s mill is running constantly, turning out the yellow bricks week after week. Hoisting works are being erected on the Telmaco, under the supervision of Mr. Argyll, the foreman. The Penelope is down about 70 feet on a good vein and drifting will soon begin. Placer mining is still carried on to a limited extent. A good deal of work has been done in the flat between the St. David and Lane's mill, where there is plenty of water.

CEDEOS ISLAND.—The schooner Ethel, with 560 sacks of ore, cleared Saturday for San Diego. On Tuesday the Nettie Sondberg arrived and cleared, having on board 77 tons of ore. All this goes to the National City reduction works, which is running night and day on Cedros Island ore. Jonas Anderson, one of the discoverers of gold on the island, came up on the Nettie. He has been there six months, and is pretty well posted. He says the Cedros Island Co. has one ledge 25 feet wide carrying \$80 ore, and that it is developing into an old-time bonanza. Timber is easily obtained, and he claims that for \$500 enough water can be developed to run a 20-stamp mill. He speaks favorably of the ground covered by the Banes concession, and says the Nativity and several smaller islands are included in the same gold belt, and will without doubt prove interesting to prospectors. Up to the present time nothing has been done in that line.

PEARL.—*Lower Californian*, May 14: Frank Gallegos of the Pearl mine at the Real, is in town. He has run a tunnel 80 feet, 50 of which is on the ledge, and it discloses a fine vein of ore. The other mines at the Real are temporarily idle, though Gen. Ryerson is making arrangements to start the San Nicolas mine and mill. Capt. Henry Cook has hit the town from San Isidro, where he has been in charge of the gang of men working on the Tepusete iron mines. He will return next week with supplies for a force of 100 men, and work will begin in real earnest under Supt. M. D. King. The Colonization Co. seems to have abandoned the work of prospecting for coal in the canyon of the Carmen.

MONTANA.

A GOLD DISCOVERY.—*Mining Journal*, May 16: It is claimed that a gold discovery of considerable importance has been made near Silver Bow Park, at Butte. Samples of black sand containing gold were recently exhibited in that city which were found a few feet below water level and which assayed \$350 in gold per ton.

THE PHILIPSBURG SMELTER.—Frank J. Wilson is corresponding with various concerns regarding the cost of a smelter for Philipsburg, and is now in possession of several letters on the subject, giving instructions and prices complete, says the *Mail*. Mr. Wilson says there is already \$7500 subscribed by a few men in town for the construction of these works, and there remains no doubt whatever that the smelter will be built the present season.

THE GRANITE'S OUTPUT.—The output of the Granite Mountain for the week ending May 8th was 47 bars of bullion, containing 72,635 ounces fine silver and 148 ounces fine gold.

PHILIPSBURG SHIPMENTS.—Philipsburg shipments of silver bullion for the month of March amounted to 361 bars, weighing 51,563 pounds, valued at \$488,849.67, not including gold, which would raise these figures to \$500,000.

WEGNER NO. 2.—The tunnel on the Wegner No. 2, at Philipsburg, struck the ore body a few days ago at a depth of 50 feet, and Thursday struck the hanging-wall, after running through 20 feet of quartz, every pound of which is pay rock.

THE BALTIMORE.—Negotiations are under way looking to the purchase of the Baltimore, near Butte, by a company of Montana capitalists. The property is owned by Sam Mackey of Argentina.

THE OHIO, AT THOMPSON FALLS.—E. J. Field of Thompson Falls, superintendent of the Ohio mine, reports continued improvement in the property. During the past few weeks shipments have been made to the Grant and Omaha smelter at Omaha. The ore shipped runs from 60 to 121 ounces in silver, and from 16 to 20 per cent in lead.

NEW MEXICO.

HANOVER.—*Silver City Enterprise*, May 16: Fourteen men are at work for the Illinois Zinc Co. at Hanover. Shipments of ore are being made regularly and as development progresses new and extensive ore bodies are being opened on the different claims. For a brand-new company they are meeting with great success. The superintendent in charge at the mine is Col. M. Twomey. The Anson S. copper mine is fast coming to the front, and although work was only started two weeks ago, it is now in the front rank among the producers. M. W. Neff, who is working the mine under bond and lease from Dr. Stephens, is personally superintending the work.

PIÑOS ALTOS.—C. G. Bell and J. I. Brown are pushing matters on the Tampico mine at Pinos Altos. They have leased the Bremen mill for a test run, amalgamating plates have been put in and the mill started crushing ore this morning. Mr. Brown devotes his time and attention to the superintendency of the mill, while Judge Bell is in charge of the mine.

GLADSTONE.—The Gladstone mine, situated about five miles from Paschal, is now being developed by Bailly, Woodward & Co. The mine was worked years ago and considerable high-grade ore shipped and large bodies of pay ore but of lower grade left standing in the mine. The shaft is 130 feet in depth and will be sunk to 250 feet, when development by drifting will be commenced.

OREGON.

PIPING.—*Jacksonville Times*, May 20: The Wadleigh mine near Waldo is operating four pipes and uncovering lots of ground. J. Dyser of Wolf creek is employing three men at piping in his mine. The rain this week increased the water supply and will prolong mining operations somewhat. A number of the miners are engaged in cleaning up and considerable gold-dust is being taken out. M. Mansfield, W. R. Mansfield and P. R. Wallis each located claims in the Applegate district last week. Cameron & Ennis have suspended piping

at their Galice creek mines for the present, and will repair the ditch damaged by last winter's storms, expecting to be able to pipe several weeks longer thereby. The famous old Fowler ledge in Steamboat district is liable to be heard from in loud tones again in a short time, as most favorable reports come from there of rich prospects. It has always been a mystery how the ledge ran out so suddenly after turning out so many thousands of dollars in gold, and expert miners have long been of the opinion that the pay streak would be found again. E. S. Smith has been superintending a force of men there for the past few months, who are now well into the mountain, in the interest of the new owners, Jonathan Bourne and J. B. Hammond, who have bought out Griffith & Co.'s interest in the mine. A big strike in that section would do much to revive confidence in the quartz ledges of Southern Oregon, and we trust their best hopes may be realized.

UTAH.

THE ANCHOR BORING MACHINE.—*Park Record*, May 17: Contractor Dull got his rebuilt boring machine in working order the middle of the week and made a favorable start to pit down the eighth inch hole from the bottom of the shaft to the tunnel level, a distance of about 600 feet. Mr. Dull has several Pennsylvania oil-well boring men assisting him. If nothing of an unfavorable nature occurs they will be able to put down the bore in from 30 to 40 days.

THE CONCENTRATORS.—The Union concentrator will commence custom work for the season on Monday morning with its capacity for treating ore to a high degree of perfection greatly increased. The Crescent concentrator commenced operations for the season on nearly 400 tons of Nevada-Northland leasers' second-class ore, and it will all have been run through and a cleanup made this evening.

CAMP CROSSCUTS.—The Daly has commenced shipping ore to the Mackintosh sampler. Surplus water is interfering considerably with the working of several of the leading mines, but this trouble will soon cease. The No. 1 side of the Ontario mill has been put in working order again after having undergone needed repairs and overhauling. The Apex is undergoing developments of a favorable nature, and a large lot of first-class ore is on the dump ready for shipment to market. Several more of the embarrassing lawsuits in which the Morgan Mining Co. is concerned have been dismissed, and some good news from this quarter may be looked for in the near future. During the week the Mackintosh sampler received and forwarded 734,120 pounds of Ontario ore; 428,170 of Mayflower No. 7 leasers'; 226,000 of Daly, and 45,200 of Nevada-Northland leasers' ore; total, 1,433,490 pounds. The foundation is being laid at the No. 2 shaft of the Ontario for a large new air compressor, and when it is in readiness sinking will probably be resumed in the shaft to the 1400-foot level.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BELVEDERE LAND CO., May 16. Capital stock, \$500,000. Directors—Geo. Bargate, T. B. Valentine, Chas. Forbes, Edgar M. Wilson and Curtis H. Lindley.

CALIFORNIA RAISIN CO., May 17. Capital stock, \$150,000. Directors—C. Christensen, A. V. Towas, N. Ames, J. H. N. Tum Suden and M. C. Theilmann.

CALIFORNIA VENEER WORKS, May 17. Object, to make veneers of ornamental California woods. Capital stock, \$200,000. Directors—P. and J. H. Hurlbut, N. and H. N. Hoffmann and J. H. Wilson.

WOMEN'S EDUCATIONAL AND INDUSTRIAL UNION, May 19. Object, increasing fellowship among women, and to promote their welfare. Directors—Margaret Deane, Hannah M. Solomon, Jean Parker, Emilie E. Kirketerp and Abbey Cheney.

SOUTH FRESNO IMPROVEMENT CO., May 21. Capital stock, \$70,100. Directors—D. and F. E. Bacon of Oakland, E. E. Bush of Hanford, John A. Merrill of San Leandro and F. A. Berlin of San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

J. C. HOAG—San Francisco.
R. G. BAILY—San Francisco.
SAMUEL CLIFF—San Luis Obispo Co.
C. J. WADDE—Cucamonga, Cal.
W. W. THORNTON—Los Angeles and Orange Co's.
E. B. TAYLOR—San Joaquin Co.
JOHN B. HILL—San Diego Co.
E. H. SODARFELT—Chaveros Co.
FRANK S. CHAPIN—Colusa Co.
J. H. R. BOYCE—Alameda Co.
W. B. FROST—Merced and Stanislaus Co's.
GEO. WILSON—Sacramento Co.
T. M. SKAGGS—Sierra Co.
H. KILLEY—Modoc Co.
IL B. PARKER—Del Norte Co.
WM. H. HILLIARY—Oregon.
R. O. PARSONS—Oregon.
R. G. HUSTON—Montana.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

A CAR LOAD of base bullion from the smelter at Spokane Falls was shipped to Newark, N. J., last week for refining. The ore comes from Colville, Wash., and there is enough to sight to ship a car-load every four days.

MECHANICAL PROGRESS.

Mechanical Foolhardiness.

Carelessness kills more mechanics than old age or disease, and the number of accidents resulting from somebody's carelessness cannot be estimated.

There is not as much danger in doing risky jobs and undertakings as there is in the everyday risks which are met with a contempt hrought about by a long acquaintance therewith, and which are hardly regarded as risks by the men who take them.

The architect takes risks which are needless when he guesses at the strain to be overcome by a beam or truss, and doubly so when he also guesses at the strength of that beam or truss. The builder in turn takes a risk when he passes defective construction with the guess and the hope that "it will hold."

In driving piling for a block of houses in Harlem, the writer noticed that some of the piles were driven twelve to twenty inches by the last blow of the hammer, and he wondered at the risk taken for the sake of saving a few dollars.

In building a railroad bridge in New Hampshire, the contractors put down piling where the last blow drove some piles four feet! Some were driven too far, whereupon the rascally contractors pulled them up again until they were in the required position.

In erecting buildings, hundreds of risks are taken by the workmen and by the builders also. In erecting machinery risks continue to be taken, and after the machinery is running it seems almost as if the attendants vied with each other in courting danger.

Begin with the fireman. How many times will he risk his life by "guessing" that the safety-valve is in perfect order. All too often he will "guess" that his boiler is safe, and run with leaks, corrosion, and he knows not what else, in that straining iron shell under which he shovels coal.

Why is all this? We may well ask. Is the man a lunatic, a fool, or what is the matter with him? There are just two other causes which may affect his behavior, or he may be lazy or avaricious; then he is a villain as well.

The architect was lazy; he didn't figure because it was easier to guess. The builder who drove the piling was a knave. He did this to make more money out of the job; the workman who got maimed or killed, the fireman who lets his safety-valve get stuck, is sometimes a fool, but more often these things happen through pure laziness.

The engineer who almost bawls exposes himself by walking under the expand belt from his engine, is lazy; but he is shetted in his laziness by knavery, in the shape of an avaricious owner, who grudges the few dollars necessary to hex up the dangerous place, and thus relieve the lazy man's temptation.

Lazy men run all sorts of risks in putting on belts, in fooling around moving machinery, and in monkeying with circular saws, planers and molders. The man who crawls around exposed machinery to oil or clean the same, when he can just as well stop the machine before exposing himself, deserves to be sent up for ten days for every offense. Only a few days since, a party of masons were building a 100 foot mill chimney. They had got up 18 feet when all at once the whole party were on the ground among bricks, mortar and splintered lumber, with two of their number seriously hurt.

An examination showed that in nailing on the last course of ledgers only one nail had been put into some of the posts, where six should have been driven—a clear case of laziness and foolhardiness combined.

Sometimes this carelessness becomes criminal, and is occasionally brought to justice, and lately, where knavery is the cause of accident, it has been frequently severely punished. There is no excuse for exposure to such accidents, and every man can educate himself out of it if he will.

Familiarity is one great cause of a man getting careless and lazy. He works around machinery so long without accident that he thinks he knows all the ins and outs, all the dangerous places and death-traps; so he will not bave to be so continually on his guard. It is a good deal of work to keep his thoughts on his fingers all the time, so our man gets a little lazy, goes too near a quick-running belt, and the first thing we know he is a subject for the surgeon or undertaker.—Condensed from Boston Journal of Commerce.

METAL DECORATION.—The new process of decoration and color printing on metal consists, says an exchange, in preparing zinc or other metallic plates in a special way, and then either nickel-plating or coppering them, a dull or bright surface, or both, being produced by mechanical agency. Specially prepared enamel colors are used, and the printing of the subject on the plate is carried out direct from stones, as in lithography. Embossing is introduced, either in the lettering or in views and such like, this part of the treatment being effected by another special detail of the process, the usual steel-plate engraving being dispensed with. The cost of production is said to be very small.

PROFITS OF LAKE SUPERIOR IRON ORE MINING.—Most of the Lake Superior iron-ore mines are paying large dividends. In some cases the profits in two years have equaled the capital

stock of the companies. These profits are generally considered phenomenal—too great for a long continuance. If they do continue, says the *Iron Age*, the situation will soon be changed by offers of more ore than the market can take, forcing prices down to an unremunerative level, and banishing for a time the hope of even small dividends. The agencies actively at work to cause this are the new mines which are being opened and the extensive preparations by old mines to greatly increase their output. If the decline in the price of pig iron indicates a depression in that trade of some duration and severity, the stockholders in mining companies have reason to look forward with apprehension, which will temper their rejoicing over the heavy dividends now in hand.

Speed and Work of Emery-Wheels.

The first and most striking characteristic of the solid emery-wheel is its enormous speed. By common consent the speed of about a mile a minute for a point upon the circumference of the wheel has been adopted. The recent increase from one mile to nearly two miles is accompanied by an increased cut, but the result is extravagant in cost, as the wear of wheel increases out of all proportion to that of metal. Few wheels can be safely run at such a speed. Running at the standard speed, the emery-wheel is equivalent to a file one mile in length passing over the metal in one minute. The hand-used tool of ordinary work at the vice-bench is equivalent to a file only 60 feet in length passing over the work in one minute. To make this comparison strictly true, the metal and the wheel must be in continuous contact for the minute. The necessary condition, apparently of general occurrence is really seldom found, and is most difficult to secure, even in lathe-turned emery-wheels. It is by no means an easy task to center them perfectly upon the grinding machine, and many workmen do not center them at all. The hole apparently fits the spindle, and they trust to that. The wheel is started, the iron melts away visibly, a comet-tail of sparks flashes across the shop. The man who sees a continuous stream of sparks fly from the emery-wheel deludes himself with the idea that he has a tool which is continuously at work. Such a man is surprised when an expert stops the machine and shows him that his wheel is hot and glazed for perhaps one-fourth of its circumference, but cold and apparently untouched for three-fourths—that he has, in fact, utilized but 25 per cent of the machine's possibilities.

What are the causes of this? Possibly the wheel was not round to start with; possibly it was not properly centered. But there are some causes not so evident and still a matter of doubt. Possibly the wheel material was not homogeneous, and expands unequally under frictional heat. Possibly, owing to the lack of homogeneity, the metal adhered to and glazes one part rather than another. Possibly, owing to the light weight of the machine and the unsteadiness of floors, an irregularly regular vibration is set up, and the wheel and work part rhythmically. Undoubtedly the high spot formed by adhering metal shoves back the piece being ground, and a large wheel-surface revolves unused before work and wheel are again in contact. The remedy is to use those makes of wheel which glaze the least, for glazing, by making high spots on the wheel, prevents all possibility of continuous contact and steady work.

The solid emery-wheel is a rotary file, which runs a mile in a minute, and whose cutting points never grow dull. This is said only of the perfect wheel, though glazing is one in which the points may be dulled. In experimenting with many makes of wheels, a curious difference is seen in their tendency to glaze. In some, the metal adheres to all parts of the surface, and finally becomes a continuous bronzed ring; in others, the metal gathers in patches. Certain makes, however, may be considered practically free from these faults under all general conditions, a slight shininess of surface being the only visible indication, while deterioration of cut is manifested only under very light pressure.—*Franklin Institute Journal*.

A NEW METHOD OF BRONZING.—Some German artisans have introduced a method of bronzing iron or steel surfaces in such a way as to prevent the possibility of rust. The object to be acted upon must be free of all oxidation or other impurity, and is exposed for two or three minutes to the vapors of a heated mixture of hydrochloric acid and nitric acid, in equal proportions, at a temperature of from 550° to 650° F. After cooling, the objects are rubbed over with vaseline, and again heated until the vaseline begins to decompose; this treatment with the vaseline is repeated once. Should a lighter coloring be desired, it is produced by mixing acetic acid with the other acids.

RAILROAD TIES OF FIRE CLAY.—Adams P. Hopkins of West Bridgewater, Pa., has filed a caveat upon an "improvement" in the form of posts and railroad ties made of burned fire-clay. The posts will be burned hard, and will have the railing secured by means of nails driven into holes made in the posts, when soft, at an angle that will bring the heads together and hold the railing firmly in place. Holes through the ties upon either side of the rail will admit bolts, the upper ends of which will have washers and nuts bearing upon the rail and holding it firmly in position.

SCIENTIFIC PROGRESS.

The Grand Possibilities of Africa.

Nothing in the way of geographical discovery, since Columbus gave a new continent to the world, has been of equal importance to Stanley's discoveries in Africa. Moreover, in this era of rapid progress in industry and art, the results of the present discoveries will be utilized more fully in a decade than were the discoveries of Columbus in a century. Says the *Age of Steel*: It is but a question of a few years when the Congo will be an eastern Mississippi, with its contributory factors of railway, etc. As a chapter in evolutionary history the march of Stanley may be a modest approximation to the voyage of Columbus, in a future of African development and civilization. The last continental stronghold of barbarism will be carried by commerce and Christianity, and old Europe, with its idle millions and its crowded markets, will find an outlet for what it may spare of men and money. It is to be hoped that this latest addition of real estate to the notice of Europe will, by some such arrangement as the International Association, inaugurated by the King of Belgium, be not a bone of contention between rival nations, but an opportunity unexcelled of much that will be a blessing to New Africa and prosperity to Europe.

Stanley regards the basin of the Congo as a veritable land of promise, with a commercial future on a line with that of the Mississippi. Eight hundred miles of railroad would open up 22,000 miles of river-bank on four great rivers and inaugurate a commercial relationship with 80,000,000 people. Immediate use could be made of such produce as wood, gums and ivory, while the possibilities of mineral deposits and agricultural development are as yet practically beyond computation. As we have said, European enterprise will have a new field and the more opportune and providential the outlet for its energies and trade, as the western hemisphere and its archipelagoes must eventually be absorbed in the commercial dominion of the dominant republic. The future of European trade lies in the East, and what has become an actuality in India may be realized in Africa.

THE CAUSE OF COOKING IN COAL.—It may sound scarcely credible to some student of pyrology and gas technics, but it is nevertheless true, that the physical cause of the caking or fusing of bituminous coal into the form of coke, under a distilling heat, is by no means understood. An attempt has been made by some German chemists to connect the physical phenomenon of caking with the chemical composition of the coal, especially with reference to the richness of the coal in what is called disposable hydrogen, or that proportion of it which is in excess of the quantity required to form water with the oxygen present. Unfortunately for the general acceptance of this standard for the caking quality in coal, it does not correspond with observed results. Neither does the richness of a sample of coke in carbon determine its caking capability; for two specimens of coal of practically identical carbon composition will often be found to behave very differently in the retort of coke ovens. If the property of caking does not reside either in the surplus hydrogen or the fixed carbon, it is certainly not to be found in the content of the coal in oxygen, which gives no indication whatever of the physical behavior of the coal under heat. Some caking coals coke without much swelling; others swell considerably in the process of caking. In either case, the coal must undergo a stage of fusion, in which it becomes a thick, semi fluid mass through which the gas escapes. Why one kind of coal should swell considerably while another variety, of similar composition, does not, is a problem not apparently capable of solution from any of the chemical data usually preserved in analyses of coals.—*Journal of Gas Lighting*.

THE DIRECT CONVERSION OF HEAT INTO ELECTRICITY is one of the certain things in the future. Even Edison has staked his reputation upon such an assertion. As showing that actual progress is already being made in this direction, attention is called to the fact that Mr. E. H. Acheson, an electrical engineer of New York, is conducting experiments having for their object this desideratum. In his experiments the energy of the converted heat acts directly on the engine through the dynamo, thus reducing the work done by the equivalent of this transformed heat, or in other words, increasing the capacity of the plant by this amount. The *Iron Age* of New York says that a gain of 35 per cent in output, boiler and engine capacity remaining constant, has already been realized. In trials which have been made by other engineers with Mr. Acheson's system, 1 electrical horse-power per hour has been developed with 11 cubic feet of natural gas per hour, while a plant of ordinary efficiency to-day requires not less than 50 cubic feet of gas per horse-power per hour developed. Mr. Acheson will continue his experiments in the hope of attaining still better results than the above.

THE SCIENCE OF EMBALMING.—Our present methods of embalming are so superior to those of the ancient Egyptians that a modern embalmer might leave a human body so perfect that, after 3000 years, says the *Lancet*, "not a lineament need he wanting for identification, while the embalmed bodies of the ancients were so soon dried up as to be utterly beyond all

possibility of recognition. Modern emhalmers are, moreover, constantly adding new and desirable features to the art, which are useful either in cases where delay in burial is needed, or for the permanent keeping of the body."

CHEMICAL EXAMINATION OF AN ANCIENT SCEPTER.—M. Berthelot has recently discussed the question of the manufacture of bronze by ancient peoples. As copper is widely distributed in nature, the use of that metal might have been expected. Tin, the other constituent of bronze, is, on the contrary, found in but few localities, and even these are of comparatively difficult access. The positive statements, therefore, which have hitherto been made concerning the general use of bronze by prehistoric peoples, have for a long time puzzled those who have given the matter attention. Archaeologists agree that the use of unalloyed copper for arms and utensils preceded that of bronze, but the date of the introduction of the alloy of copper and tin has never been satisfactorily settled. Among the many so-called bronze implements contained in collections of Egyptian antiquities, one, the scepter of Pepi I, a king of the sixth dynasty, archaeologists have agreed belongs to an age between 35 and 40 centuries before the Christian era. From the interior of this scepter some small fragments of the metal were dislodged, and sent by the director of the British Museum to M. Berthelot. An analysis of these particles failed to indicate the presence of even a trace of tin or of zinc. From this M. Berthelot argues that bronze was unknown at this epoch, as otherwise it would have been used in this instance instead of the softer copper. He comes finally to the conclusion, based upon this and other proof, that the art of bronze manufacture has not been known at any rate for more than from 50 to 60 centuries.—*American Chemical Journal*.

A MOVING MOUNTAIN.—A traveling mountain is found at the Cascades of the Columbia. It is a triple-peaked mass of dark-brown basalt, six or eight miles in length where it fronts the river, and rises to a height of almost 2000 feet above the water. That it is in motion is the last thought which would be likely to suggest itself to the mind of any one passing by; yet it is a well-established fact that this entire mountain is moving slowly but steadily down the river, as if it had a deliberate purpose some time in the future to dam the Columbia and form a great lake from the Cascades to The Dalles. The Indian traditions indicate immense movements of the mountains hereabout, long before white men came to Oregon, and the early settlers, many of them immigrants from New England, gave the above-described mountains the name of "traveling mountain," or "sliding mountain." In its forward and downward movement, the forests along the base of the ridge have become submerged in the river. Large tree-stubs can be seen standing deep in the water on this shore. The railway engineers and trackmen find that the line of the railroad which skirts the foot of the mountain is being continually forced out of place. At certain points, the road-bed and rails have been pushed eight or ten feet out of line in the course of a few years. Geologists attribute this strange phenomenon to the fact that the basalt, which constitutes the bulk of the mountain, rests on a substratum of conglomerate, or of soft sandstone, which the deep, swift current of the mighty river is constantly wearing away; or that this softer subrock is of itself yielding, at great depths, to the enormous weight of the harder material above.—*Astorian, May 7th*.

"POGONIP."—It is said that the mountain regions of Nevada have a climatic phenomenon called the "Pogonip." It is a sort of frozen fog that fills the air at times in winter. It often appears on the clearest and brightest days, coming suddenly from no one knows whence. In an instant the air is filled with floating needles of ice. To breathe the pogonip is death to the lungs. When it comes, people rush to cover. The Indians dread it as much as the whites. It appears to be caused by the sudden freezing in the air of the moisture which collects about the summits of the high peaks.

DISINTEGRATION OF ROCKY STRATA.—If sodium sulphate be allowed to crystallize between plates of unglazed porcelain in the open air, and if the crystallization be reproduced two or three times by sprinkling with water, the plates fall to powder. The same phenomenon is observed with very hard stones. This crystallization may be the cause of the comminution of rocks which resists water.

A NOVEL TELEPHONE, invented by an American, has for its primary feature the transmission of sound by the vibration of glass. From a glass diaphragm extend a number of glass tubes of various sizes communicating with an ordinary wire. Very clear and distinct utterance has been found to result on trials over a line three miles long.

A NEW MINERAL has been discovered in the vicinity of the little town of Homer, Ky., and the inhabitants of that place expect to realize millions. The substance discovered has a black, pitchy formation, and is of a loamy appearance. When placed in the fire, it burns with a clear, steady flame and makes a brilliant white light.

GOOD HEALTH.

Health Throughout the State.

Reports have been received by the State Board of Health from 100 localities in the State with an estimated population of 825,000, which indicate a very favorable condition of health for the month of April. The month was characterized by an entire absence of epidemic disease. The very favorable weather that prevailed seems to have had a beneficial effect upon the general health of the State. The deaths have reached only 13 per thousand—a very low rate.

Whooping Cough.

Whooping cough, as a malady, has not been prevalent, only four cases having been reported, is, nevertheless, a malady which should be better understood and guarded against. The report speaks of it as follows, quoting from the *Sanitary Record*:

Whooping cough is too often regarded in the light of a trifling and unavoidable malady, and it rarely happens that the slightest precaution is taken against its spread by infection. Some amount of blame, moreover, attaches to medical men, who, in many cases, fail to insist upon the necessity of isolation and disinfection. Yet the live contagion of whooping cough is not less active, distinct and subtle than that of scarlet fever or smallpox. As in many other affections, although the number of deaths as an immediate result of the disease is of itself great, yet it may be doubtful if the remote mortality is not much greater. The strain on the delicate lung tissues leads to emphysema and other grave complications that often prove fatal after the lapse of many years. Meanwhile, let parents be taught to regard this scourge in a truer light, by avoiding the bringing of their children in contact with the disease where it can possibly by diligent inquiry be ascertained to be present.

Cerebro-Spinal Fever

Was the cause of seventeen deaths during the month—an increase over the previous report. The report, after alluding to this disease as more serious in character than remittent and intermittent fevers, continues as follows:

"In connection with these zymotic affections we cannot but regret that the example of Minnesota is not followed in this State. There the law requires that in the month of May, or oftener in each year, the Health Officer shall make a thorough sanitary inspection of the city, town, or village under his jurisdiction, and present a written report of such inspection at the next meeting of the Board of Health, and shall forward a copy of such report, as soon as rendered, to the State Board of Health. This wise provision of the law has been followed by the most salutary results. It gives the Health Officer a complete knowledge of the sanitary conditions of the town, and in case of an outbreak of disease he is in a position to know its probable cause, and is thus quickly enabled to use the means necessary for its suppression or extinction, to the saving of many lives and the great monetary interest of the community."

Cancer.

We notice that cancer was the cause of 32 deaths. The number of deaths from this cause last month was 44. Large and increasing as are the fatalities from this malady, the Board of Health is studiously silent in regard to it, although we will guarantee that a few hours special observation in this city would satisfy the Board that quite a number of patients are discharged here every month as cured, after they have been pronounced afflicted with cancer by one or more of the physicians and surgeons in this city. A large number of such patients have been thus cured after ineffectual attempts have been made to eradicate the disease with the knife in the hands of our leading surgeons. This malady is rapidly increasing, and has already reached near the head of the list of fatalities. So important is this matter considered, and so apparently indifferent are the health guardians to its increase, that a number of our leading philanthropists and several well-to-do people, who have been cured, after failing to get relief from the regular faculty, are seriously contemplating the establishment of a cancer hospital in this city, where proper care can be taken of people so afflicted. If such an institution should be established, there is no doubt but that it would result in arresting the rapid increase of this terrible malady with which the regular faculty are entirely unable to cope.

A TEST FOR MALARIA.—A loving father, who, at a summer resort last season, had left behind him four beautiful children, dead of diphtheria, said to me, "That hotel proprietor was as much a murderer as if he had shot my little ones." Yes, dear sir, but you, the guardian, ought to have been armed and equipped against such foes. An hour's intelligent examination of water supply and drainage at a proposed country home would, in a large majority of cases, prevent the risk of such a catastrophe, and might be made before a landlord could object. Take in the dressing-hag an ounce vial of saturated solution of permanganate of potash, which any druggist will prepare for a few cents, and put half a dozen drops into a tumbler of drinking-water that is supplied. If it turns brown in an hour, it is, broadly speaking, unfit to drink; if not, it is not especially harmful.

fnl. If a country hotel's sewage system is confined to cesspools within a hundred feet of the house, and near the water supply, take the next train to a point farther on. These matters should force themselves on one's personal attention, quite as much as the undertaker's bill that occasionally follow their neglect.—*American Magazine*.

USEFUL INFORMATION.

A MACHINE FOR HARVESTING BEANS is the latest addition to agricultural machinery. In raising beans for the market on a large scale, every consideration of profit and economy demands ready facilities. In a bean field of 20, 50 or 100 acres, it would require a large force to do the pulling by hand and collect the vines in piles preparatory to hauling in to the thrashing floor. The machine, which is the invention of John Yocom of Ridgetown, Ont., Can., is adapted to be drawn between two rows of beans by one horse, and diverging blades tear off the plants at the roots and crowd them outwardly toward the outlying rows. The next trip being made between the next contiguous rows, the effect is to hustle two rows together, and the driving being done in every third space, the work progresses very rapidly. The implement is handled like a cultivator and is just as easily operated.

NEW PROCESS AND MATERIAL FOR MAKING PASTE.—Messrs. Gustav Turk & Witting Bros. of London, England, have a valuable process for making adhesive paste from the straw bolls that accumulate in the manufacture of paper. This paste can, by the process, be purified, and will be found a cheap and efficient substitute for gum arabic. The water having served its purpose in boiling the straw, is drawn off and sent through a coarse filter, then reduced by evaporation, and forms a stiff brown paste which can be evenly spread on any substance, and which will not ferment. This feature is most valuable, as ordinary paste very quickly becomes foul and deteriorates rapidly. Considering the many thousands of barrels of paste which are used every month throughout the country, this new material, made from what has heretofore been a waste product, may be considered a valuable and economic substitute.

BLUE FLAME DRIFTWOOD.—A new fad is being introduced at the East in the shape of colored flames for parlor wood fires. A Boston paper says that a demand for fuel burning with various-colored flame has been created wherever the so-called "blue-flame driftwood" has been exhibited and used. This driftwood comes from seaport towns, where old coppered ships are broken up. The timber becomes saturated with the copper acted upon by sea-water, and when used in the fire-place, burns with brilliant colors to the flame. This has led to an artificial substitute called iridescent fuel, and the process has been patented by a Boston company, which proposes to sell the right to manufacture throughout the country. Either wood or coke may be used.

LEATHER FROM BEECHWOOD.—Dr. George Tenina of Vienna has a process for the manufacture of artificial leather from red beechwood. The heat wood for the purpose is taken from 50 to 60 year old trees, cut in the spring, which must be worked up immediately, bark peeled off, steamed, treated with chemicals in a kettle under pressure, and exposed to several more operations which the inventor does not mention, as he wants to have them patented. From the prepared wood, strong and thin pieces are made by means of pressure. The inventor states that solid sole leather can be obtained, which he claims is superior to the animal leather in firmness and durability, and can be worked up in the same way as animal leather, nailed and sewed.

A MOST WONDERFUL TOY has been on private exhibition in Paris. Fancy seven life-sized kittens covered with real skin, but with eyes of emerald set in pearly white enamel and each playing on a musical instrument—a flute, a zither, a violin, a drum, a harp, a cornet and an accordion, all perfectly harmonized and playing the most difficult operas—then you have the picture complete. The mechanism is similar to that of a music-box, and the whole apparatus, kittens et al., is valued at 20,000 francs.

SPIRIT PHOTOGRAPHS have been produced by being first painted upon a screen with a solution of sulphate of quinine or any fluorescent substance, which will be quite invisible by ordinary light; but if the ultra-violet rays of the spectrum are allowed to fall upon them, they become visible at once. Owing to the great actinic power of these rays, a photograph of such a screen will show these invisible characters upon the finished plate. Certain mysterious "spirit photographs" have been produced in this way.

GLASS SPINNING and glass-flower manufacture are a very extensive branch of Austrian glass industry. It is now so developed that a petroleum flame gives some 1550 yards of glass thread every minute, that is woven not only for glass cloth, etc., but also for watch-chains, bracelets, etc.

ENGINEERING NOTES.

Marine Engineering—Four-Masted Schooners.

A point has been reached in the building of four-masted schooners for the carrying trade on the Atlantic Coast, where it seems likely that owners may yet have to take measures to insure them themselves. A very large amount of New England and New York capital has within three years been directed to the building of this class of vessels, because it was believed that the ideal freighter had at last been found—the vessel with the carrying capacity of a ship without the expense of maintenance of a square rigger. The new vessels are fast with a ocean wind and have been very profitable.

But their frequent loss is beginning to shock the capitalist who has been investing in these craft, and in ports farther to the eastward than New London the great number of losses on large four-masted schooners which have recently occurred have unsettled the underwriters, and some of the insurance companies, it is reported, will not write them hereafter. Others have increased their rate from one to two per cent.

The principal trouble with the four-masters is found to be in their rig. Their lower masts are so lofty and are ranged so closely together that the standing rigging does not have a fair chance to support them. The shrouds or stays are so much larger than those on square-rigged craft, and form such a sharp angle with the range of the masts, that the spars have almost no support in a heavy seaway. In a square rigger the vessel is found to be of equal beam, while the masts are much shorter—consequently the spars are supported firmly.

In nearly all of the cases where it has been necessary to abandon four-masters at sea, it is found that the masts of the vessels have been carried away, thus rendering them unmanageable in a seaway. It is also considered that the centerboard is another objectionable feature of the four-master, as it is alleged that it weakens the ship's keel. The centerboard works up and down through a long slot in the keel, and the larger the vessel the larger the slot. Many builders now believe that a keel should be substituted for the board in vessels of over 400 tons. It is also said that the light draught of these craft is a bad fault. They are built so as to run in the shallowest water to discharge, and this fault of course injures them for deep-sea sailing. Again, it is said that underwriters do not think the large schooners carry sufficient crews and that they depend too much upon the engine to make or shorten sail, and, in case the engine becomes disabled, the men are liable, because of lack of numbers, to be placed in a position where they would be powerless to avert disaster.

The tendency of the schooner-builders seems now to be to fall back to the construction of the three-masters of 500 or 600 tons burden. It is found that these are the safest and best vessels for investors in the long run.

ELECTRICAL MOTORS UNDERGROUND.—Is the grip to be done away with in its use on cable railways? It is an open secret, says the *St. Louis Globe-Democrat* that several professional inventors are trying to perfect a new street-car motor to combine the advantages of cable and overhead electricity, and to do away with the objections of both systems. The idea is to construct a conduit somewhat similar to that used for cables, but large enough to allow a small electric motor to run on very narrow-gauge tracks laid underground. Each motor will be connected with a train of cars by means of a rigid coupling which will run in a slot just as the grip of a cable car does. To make the invention a success, the engineer must be able to ride on the surface car, and yet have perfect control over the motor running underground. The difficulties are by no means appalling in the light of recent triumphs over apparent impossibilities, but the motor will have to be very small, or the conduit would be too large to be practicable. This is a revival of the scheme of the first patentee of the conduit street-motor system. His idea was to run a steam locomotive in a tunnel and have a rigid connection with the cars above. The impossibility of constructing tunnels under the streets large enough to admit locomotives killed the scheme before it was well announced, but it is believed that electricity will remove all the difficulties.

CHINESE ENGINEERS.—As a literary curiosity, the Chinese translation of eight chapters of Mr. Matheson's "Aid Book to Engineering Enterprises," which has recently been published, will probably be unrivaled for some time to come. It is the first technical work in the Chinese language on railway and harbor construction. The Chinese title of the work would read in English as follows: "Essay on Construction, Englishman Matheson gives the idea. Englishman Feyer and Chang Tien translated it." The work is printed on fine, thin rice paper, from large type, and the book is inclosed in loose boards of polished rosewood, held together by silk ribbons, each chapter being separately stitched into a silk cover. The original engravings have been faithfully, though quaintly, reproduced on a larger scale.

The latest novel use for refrigerator cars is the shipment of pianos. It is proposed to use

such cars not only for perishable freight, as heretofore, but for all goods which are affected by changes of temperature.

ELECTRICITY.

The Path for the Future.

The present status of electricity, while full of difficulty and worry, is also full of hope, remarks *Electric Power*. By the cutting off of the supply of currents in New York for the arc and incandescent lights it has been revealed to the people, in a manner that no other course could have done, how absolutely essential to their comfort and well-being the newly utilized force has become. The temporary losses and annoyances to the electrical companies, though very great, will therefore prove in the end to be of lasting benefit, and when the service is resumed the demand for electric light will be greater than ever before, and the now existing disagreeable and annoying circumstances, due mainly to the injection of politics into business affairs, will be remembered as a lesson.

But the electric light, though at present the most extensive, is destined to be only a branch, and a small branch at that, of the application of electricity to the service of man. It is no wild dream of the imagination to look forward to the time when all the light, power and heat necessary for man's comfort and happiness will be supplied by this inexhaustible natural force, cheaply, safely and conveniently. When Bulwer wrote his novel, "The Coming Race," it was thought that his description of the force "Viril," which he put into the hands of his characters, was overdrawn and impossible. But the chief powers of "Viril" are already found to be possessed by electricity, and the few remaining properties which Bulwer assigned to "Viril" are not beyond the bounds of future discovery and invention. To the "coming race" of Bulwer the telephone and phonograph would have been as wonderful as their "Viril" appeared to us at the time the book was written.

THE MYSTERIOUS POWER.—A recent writer on modern electrical theories shows that a few striking phenomena, taken together and reduced to one primal cause, point quite conclusively to the necessary existence of some medium by which electrical action, whatever its nature may be, is transmitted, this medium being placed in a state, potentially, which it did not possess before the electrical influences were applied to it. Prof. Rowland points out very forcibly that not only are the actions to be considered which go on within the conductor, transmitting the so-called manifestation of force—electricity—but that that peculiar state is equally existent beyond the limits of the conductor in space; and, indeed, that electrical disturbances are transmitted into space far beyond what is generally supposed to be the fact, due entirely to the transmitting medium, the ether. Though the electric current is an unsolved mystery, a very great advance in understanding it is involved in the knowledge that to the outside disturbances in the medium must observation be directed in search of more light.

THE TRUTH ABOUT DANGERS OF ELECTRICITY.—The committee appointed by the Senate of the New York Legislature to investigate the dangers of electricity held its sessions in New York City, took testimony and reported. The following paragraph from that report contains the result in a few words, but very suggestive ones: "It appears that 16 persons have been killed in the city of New York during the past three years from electrical currents, most of them being employees of electric companies. Most if not all of these deaths were caused by a continuous current used for arc lighting. As far as the committee could ascertain, no accident has been caused by underground conductors. The causes for most of the deaths appear to have been carelessness on the part of the electric companies in using poorly insulated or badly arranged conductors, and in neglecting other precautions required for safety. It appears doubtful if an overhead system of wires carrying high-tension currents could be, under any circumstances, maintained in the crowded streets of the city of New York without more or less danger to the public."

HEATING CAPACITY OF ELECTRICITY.—E. C. Hughes, one of the electricians of the Pillsbury Mill, has lately been experimenting with the heating capacity of electricity, and has demonstrated that almost any degree can be produced with comparative ease. He had gotten up an oven for baking and heating gluten, which is a great success. The gluten is placed in a cylindrical glass case, about an inch in diameter, which in turn is placed in the oven, the latter also being in cylindrical form.

ELECTRICAL LAUNCHES ON THE THAMES.—This season there will be 24 electrically propelled launches upon the Thames. Electricity, altogether, is in favor on the river, as many house-boats are being fitted with the electric light.—*London Invention*.

AN ELECTRIC CANDLE is one of the newest productions of the Edison-Swan Co. It is fitted upon a candlestick or candelabra, and is twisted into a flamboyant spiral, to give the illusion of a flame.

Passing Events.

The lower House of Congress has finally passed the McKinley tariff bill after a long discussion. Nothing definite has yet been done about the silver question, which is still under consideration in the Senate.

The mining people of Fresno county are felicitating themselves on having found the mother lode of California in their mountains. It is to be hoped that the assertion will prove true, but "mother lodes," like "lost mines" and "second Comstocks," are in these days looked upon incredulously, there having been so many reports which proved to be without basis.

The molders' strike still continues. More men arrived from the East this week for the shops, and, as usual, a small proportion were "captured" by the strikers. Still the shops are all running, as they have been for the past few weeks.

The movement has commenced toward properly representing the interests of California at the coming World's Fair at Chicago. All persons interested in mining should do their share toward seeing the mining industry as well represented as that of agriculture.

Always Take a Receipt.

Subscribers to this paper are earnestly requested to take a receipt for every payment made on subscription, no matter how small the amount or to whom paid. We use printed receipts, with stubs attached, to prevent mistakes, through carelessness (or other reason), by agents or others. For our mutual interests take a receipt, whether you preserve it or not.

To Illustrate Our Mining Industry.

It is to be hoped that an active interest will be taken by the miners and mine-owners of this State toward properly representing the mining interests of California at the World's Fair in Chicago. It is evident that the State intends this time to make a good showing, as already the subject is being agitated in many communities, and the Governor has started a general interest by calling attention to the matter. The agricultural and horticultural interests are sure to be well represented owing to the numerous societies and associations connected with such matters and the fact that those having lands to dispose of will give aid and assistance to anything which will advertise these industries and induce immigration.

Among the miners, however, there are no clubs, associations, or societies. Those men who are very prominent in the industry and have gained wealth in mining, have little or no personal interests to serve by an exhibition, and are apt to be apathetic. As far as selling mines is concerned, very little has been accomplished by exhibitions held in the past. It takes personal representation and examination to do much in that direction. It is no easy matter, therefore, to arouse an interest in a mineral exhibit. Circulars and letters to miners do little good. If accredited representatives should be sent in person to the various mining centers, good collections of ores could be made, but not unless this is done.

It is to be hoped, however, that if money is to be spent for a mining industry exhibit, it will not all be spent in collecting ores. A fine representative collection of minerals could be forwarded from the State Museum of the Mining Bureau. These specimens are already collected, identified and labeled, and could be arranged for display with much less trouble than trying to make a new collection.

Moreover, a mere display of minerals conveys little idea of the mining industry to ordinary people. They do not understand their significance, and to a large majority a fine specimen of iron pyrites would serve as gold ore.

What is wanted is some sort of graphic representation of our mineral resources—separate maps or casts, for instance, showing location in the various counties where certain minerals are found. Plaster casts of the whole State could be made in number, each one showing the locations of a separate mineral substance. California is known for gold, but it produces many other substances. For instance, within our borders are found gold, silver, borax, chrome, coal, copper, granites, gypsum, infusorial earths, iron, kaolin, lead, marble, ocher, petroleum, salt, sandstone, slate, cement, natural gas, plumbago, asphaltum, bituminous rock, aluminium, asbestos, tin, clay, nickel, lime, quicksilver, mineral paints, sulphur, lithographic stone, mica, platinum, magnesia, and other mineral products.

Under or near each of these plaster casts could be placed samples and specimens of the crude material and the finished products, illustrating the uses to which they are put.

In the case of the more prominent substances, the machinery and processes used should be shown. As for gold mining, the common miner's pan, cradle and sluice, the hydraulic giant, elevators, etc., could be exhibited, illustrating the appliances connected with the placer and deep gravel mining. Then the old-style arrastra driven by a mule could be shown side by side with a modern stamp-mill driven by water-power. All these could be shown at work on gravel and ore, of which there should be enough to show the working of the whole process. Of course we could not wash down a gravel bank with a giant, but large drawings, paintings and photographs would serve to convey the idea.

All this will cost money, of course, but it will serve a purpose which a mere labeled collection of ores in glass cases will not do. Every mine in the State could be represented. Models of the work of large plants could be made.

This should all be attended to by competent persons. In this connection the following letter is of interest:

Honorable George C. Perkins, President of the Chamber of Commerce—DEAR SIR: By virtue of the office with which I have been honored, it gives me pleasure to announce to your honorable board that it is within my duties to

look after and examine into the mineral resources for the benefit of our State. I have for some time personally, and through my field assistants, been canvassing in the mining counties in reference to having a proper mineral display at the World's Fair, and it is my opinion that the different products should be separately exhibited with due credence to the counties, and not blended as quartz, grain, etc., by each county. Where our products are so widely at variance, we should give each industry a separate and decisive display. I therefore offer to your honorable board my services in behalf of the State to work up our mineral display, and believe I can safely promise both stamp and rotary mills, and appliances for working ore and recovering gold, from the primitive rocker to the improved hydraulic elevator. Very truly yours,

WILLIAM IRELAN, JR.,
State Mineralogist.

With a suitable appropriation, the State Mineralogist could arrange a very creditable display. But it is to be hoped that the subject will not be dismissed by sending a simple collection of minerals alone. More is needed than that to attract attention to the mining industries of California.

The Silver Bill Under Debate.

Senator Jones' silver bill is still under debate in the U. S. Senate. The speeches delivered by Senators Jones, Teller and Stewart during the debate are master efforts and win for them unqualified praise. Their presentation of bi-metallicism should disarm opposition and bring to its support the clear thinkers who are not controlled through money or other considerations. The discussion in Congress and the so far favorable effect of the advance in the price of silver carry out quite fully the MINING AND SCIENTIFIC PRESS' heretofore expressed views of the natural result of remonetizing the metal. The effect is far-reaching, probably more so than even its most sanguine friends contend will follow. There is no leading industry but will either directly or indirectly be benefited by silver being remonetized.

To show how the question is viewed abroad, we take the following from the London Money, May 3d, in an editorial under the caption "The Silver Rift in the Clouds":

The rise in silver has naturally led to a rise in all silver securities, and, not unreasonably, it has also advanced very sharply the price of American railroad securities. Indeed, during the past ten days there has been more business in the American market than has been seen for over a year in the same time. This is not surprising, for it is clear that if the legislation takes place, prices of all kinds must rise. At present the American revenue so largely exceeds the expenditure that immense sums are locked up in the Treasury. Every now and then a portion of the money is expended in the purchase of bonds. But this leads to the calling in of bank notes, or, what is the same thing, the deposit of an equivalent amount of coin or greenbacks, and thus there is constant complaint that the action of the Treasury is restricting the circulation and disturbing the money market. If the purchases of silver are doubled, or somewhat more, there must be a very large increase in the currency, for the present coinage of silver and gold suffices to counterbalance the action of the Treasury, and the increased silver issues will therefore go to augment the currency. But with an augmented currency at the rate that is now proposed all prices must rise. Even if there is some delay in the passing of the measure, it will become law before the autumn, when there is always a great outflow of coin and notes from New York to the interior. A largely-increased issue of silver notes will supply the South and the West without drawing as inconveniently as in past years upon New York.

There ought, therefore, to be much less stringency in the New York money market next autumn than there usually is, and yet the South and the West will be fully supplied. Consequently speculators seem justified in their argument that the result of the proposed legislation will be to assure so comparatively easy a money market next autumn as to allow of an immense business upon the Stock Exchange, as well as throughout the country, and therefore to make certain a sustained rise in all prices. An inflation of the currency must raise wages and the price of commodities, as well as securities.

A BIG CONTRACT FOR THE RISON.—The Rison Iron Works have been awarded the contract for all the winding machinery for the new plant of the California-Street Railway Company. The work will all be done in this city.

THE two last carloads of ore shipped from Ponjade's Spring mine sold in Salt Lake for \$66 per ton and \$190 per ton respectively. Pioche appears to have a paying mine that is not much talked about.

The Pioneers Passing Away.

(Concluded from page 345.)

many years, Mr. Bull was possessed of considerable other property in this city. He was also interested in a large number of corporations, and owned a majority of the stock of the Gold and Stock Telegraph Company. He was also the owner of a one-third interest in the California Market.

He was considered a remarkably shrewd man, careful and polite in business matters, and of a retiring disposition.

William P. Foller, who died on Saturday at the age of 63, came to California in 1849, around the Horn, and on reaching this coast immediately went to work in the mines. He did not remain at that vocation long, but in a few years returned to Sacramento and opened a paint and oil store with John Rivet, the firm name being Rivet & Co. The business was continued under that firm name until 1857, when Mr. Rivet was succeeded by Mr. Hather. He afterward entered into business with Mr. Whittier, and established what is now the third largest house of the kind in the United States. The firm deals in paints, oils, glass, etc., and manufactures white lead and mineral paints. Mr. Foller was a man of gentle manner, and had a reputation for strict integrity. As a business man Mr. Foller was prominently known, and by his business ability acquired a large fortune. The deceased was a member of Golden Gate Lodge of Masons, and was also identified with the San Francisco Board of Trade and Chamber of Commerce.

John H. Redington, who died on Saturday, was one of the best-known merchants on the Pacific Coast, having been connected with the drug firm of Redington & Co. He came to California in 1849, and had been engaged in the drug business in this city for nearly 40 years. His was the pioneer wholesale drug business of California.

Mr. Redington was born at Waterville, Kennebec county, Maine, in 1825. He was raised and educated in this little village. The deceased was classed as one of the argonauts who did much to lay the foundation for the great State, and he continued in the drug business until 1875. During that year his health failed him and he sought the climate of Santa Barbara. Mr. Redington, whose name still clings to the firm in this city, leaves a widow and seven children; the eldest is a son 24 years of age. Deceased leaves a fortune estimated to be about \$1,000,000.

Yellowstone Park.

The Yellowstone National Park is in the extreme northwestern portion of Wyoming Territory. Its area is between 4000 and 5000 square miles. The Park plateau, with the adjacent mountains, presents a sharply-defined region, in strong contrast with the rest of the northern Rocky Mountains. It stands out boldly by itself, unique in topographical structure and complete as a geological problem. The central portion of the Yellowstone Park is essentially a broad, elevated, volcanic plateau, between 7000 and 8500 feet above sea-level, and with an average elevation of about 8000 feet. Surrounding it on the south, east, north and northwest, are mountain ranges with culminating peaks and ridges rising from 2000 to 4000 feet above the general level of the enclosed table-land. South of the Park the Tetons stand out prominently, the grandest peaks on the northern Rocky Mountains. To the eastward lies the well-known Wind-river range. Along the entire eastern side of the Park stretches the Absaroka range. At the northeast corner a confused mass of mountains connects this range with the snowy range. The Gallatin range incloses the Park on the north and northwest.

The scenery throughout the region is inspiring and wonderful. The canyons, falls, lakes, geysers and rivers must be seen to be appreciated. A brief description within the province of a newspaper article would fail to do the subject justice. The map given on the first page was made by Arnold Hague of the U. S. Geological Survey, who has contributed a paper on the geology of the district to the Am. Inst. M. E. The map will give an idea of the general geographical features of the section.

ALL the miners at the Roslyn coal mines, Wash., have signed contracts for another year.

The Deep Gold Placers of California.

(Concluded from page 347.)

The following notes on the Muir glacier of Alaska are selected from the very interesting work of Prof. Wright of Oberlin, Ohio, "The Ice Age in North America":

"This now celebrated glacier lies in latitude 58 50 north and longitude 136 40 west of Greenwich. Twenty-five or thirty small islands, the Beardslee islands, near the mouth of Glacier bay, composed of loose material (glacial detritus), show a striking contrast with other coast islands.

"The width of the ice where the glacier breaks through between the mountains is 10,664 feet. The main body of the glacier occupies a vast amphitheater, with diameters varying from 30 to 40 miles. The depth of water 300 yards south of the ice front is 516 feet, and the altitude of the ice front itself, 250 feet. A short distance back, the general height is 403 feet. Seven miles from the front, on the ice, the altitude is found to be 1050 feet above the bay."

There are many reasons to believe that great bodies of glacial ice once existed in the mountains of California, in inland basins and along the seacoast.

The glacial area of Switzerland is 900 square

the mountain valleys. In high altitudes they reach the sea; in Switzerland some extend for 30 miles more or less and have a width of a mile or more, and are often as much as 800 feet in thickness. The second order seldom extend below the deep canyons in which they are formed. Those of the third order are called recremented glaciers; they are built up of frag-

and the flow are in equilibrium. During an unusually favorable season they advance and push the moraines of former years bodily forward with resistless power. In a warm season a glacier recedes. When a season is wet, and an unusual fall of snow occurs during the winter, it is elongated.

The motion of the glaciers, like that of a

FIG. 10.—MER DE GLACE.

FIG. 11.—GLACIER OF ALETSCHE.

miles. The Aletsch glacier is the largest, being fifteen miles long. The grandest glacial mass is that of the Bernina chain; the glacier covers 330 square miles.

Biederker thus wrote: "The Rhone glacier is nine miles long and rises terrace-like, resembling a gigantic waterfall suddenly arrested in its career by the icy hand of some Alpine enchanter."

The present glaciers of the Alps are believed to be the shrunken remains of far greater ancient glaciation.

According to Prof. Wright, "The indications that the Muir glacier is receding and that its volume is diminishing, are indisputable and numerous. It is not incredible that glaciers filled the whole bay 100 years ago."

The decay and retirement of the great California glaciers must have been extremely gradual, and during the last stages, their power being feeble, instead of pushing the rocks before them in gigantic ridges as they did in their prime, they left the boulders in the old channels. After their recession, the great depressions were filled with water and the deposit of pebbles began and continued until the overflowing dyke of eruptive mud covered them as we now find them.

General Description.

A glacier is a river of ice. According to Geike, there are three varieties, the first order extending from the snow of the summits to

mounts which would be icebergs under other conditions, but now fall from ice cliffs and become by regelation a solid mass, in turn governed by the same laws, which move slowly downward like the glaciers of the second class. Such a glacier observed by Geike in Arctic Norway was fed by a succession of avalanches from those above.

Glaciers move downward until liquefaction

river, is unequal, being greater in the center and near the surface than along the sides and bottom. The rapidity of the flow depends on the declivity. The daily flow of the Mer de Glace in summer is 20 to 27 feet in the center and 13 to 20 feet at the sides. The glacier at Jacobshagen on the west coast of Greenland flows 48 to 69 feet daily in August.

But the liquefaction below is constantly sup-

plied by the falling snow above, and the grinding and crushing of rocks goes on for centuries without cessation. Glaciers drain the snow accumulations above the snow-line as rivers do the watersheds below.

Moraines are accumulations of earthy debris caused by a glacier. A terminal moraine is a ridge extending across a valley in which a glacier lies. It is mostly composed of blocks and rock fragments which have been borne down on the ice and dropped over the ice cliff which marks the termination of the glacier.

It is also partly earth and till, pushed forward by the moving ice. These moraines are sometimes so large that they are regarded as considerable hills or even low mountains. Those of extinct glaciers mark their former position. They are studied with great interest by geologists. A lateral moraine is a similar gathering somewhat elevated by pressure, on which is piled crushed rocks as in the case of the terminals. These accumulations rise high above the ice surface.

Conditions Under Which Glaciers May Exist.

The following conditions must exist before a deposit of snow can become a true glacier: It must lie on an inclined surface at a considerable altitude, in a climate sufficiently humid to insure heavy falls of snow at intervals, followed by periods of warmth during which a portion of the ice is reduced to water.

Heat is as essential to this condition as cold; a sheet of ice or snow without accretion, on a perfectly level surface, at a constant temperature of zero, could do no work; but in a mountain canyon of sufficient dimensions, when the snow accumulations are great, it is one of the most powerful agencies known to the geologist.

As the lower portion is melted and passes away, the icy stream flows down, slowly to be sure, but with resistless force, grinding the hardest rocks to mud, scooping out deep channels, often forming basins which become lake-beds when the glaciers retire, which they generally do in time and with a change of climate.

Were it not for the constant fall of snow at the head of the glacier, and the extreme slowness with which the ice river flows, this action would be brief.

There are two kinds of ice—snow ice and water ice. One is compressed and partly melted snow, the other frozen bodies of water. Recent snow on mountain-slopes above the snow line gradually assumes granular structure which merges at last into "névé." This is a name given in Switzerland to semi-ice in a state between newly fallen snow and glacial ice; it is gradually consolidated and filled with air globules, sand and mud. When in large masses it is blue in color, and sometimes shows a veined structure, alternating in bands of white ice full of air bubbles and transparent blue ice.

Beneath the surface of the Glacier des Bossons in the Valley of Chamouni, which I visited in 1872, a tunnel had been driven. The effect within was that of daylight illumination through windows of light blue glass. This color is probably due to the decomposition of light or to polarized light, and not to any actual color of the ice itself.

Névé continues to the snow line and becomes glacier ice below, which is often transparent.

Newly fallen snow is white, not from any inherent color it possesses, but from refraction of light from the numerous air bubbles entangled in the snow crystals at their birth, for the same reason that milk is white, although the fat globules are transparent.

During the midday heat of summer the snow, partly melting, yields up the air bubbles and by its weight becomes semi-ice, a change which takes place in the hands of the schoolboy when he quickly fashions the hard snowball, which he could not do with all his skill on a cold day with newly fallen snow.

In Greenland, different conditions exist. The great ice sheet does not wholly follow inclined planes, but sometimes flows up the sides of ridges; snow accumulates inland, the weight of which causes it to flow in every direction from the center toward the only point of less resistance, the seashore. The warm seacoast causes the ice to become softer and to offer less resistance to the pressure from the center.

There are no moraines on the inland ice of Greenland except where a few high points project above the ice sheet which extends for an unknown distance inland and lies on a plain sloping to the ocean. As it flows into the sea, it breaks off at intervals at the crevasses and forms icebergs in cliffs from 1000 to 2000 feet high, which float away and meet in semi-tropical seas.

Fig. 12 represents the Greenland inland ice. It is reproduced from "Science for All," Volume 5.

The snow line is a well-defined horizon above which snow does not wholly melt during the summer. The snow line in the Alps lies at an elevation of 8500 feet above sea level. In the Andes it is 18,000 feet, and on the northern slopes of the Himalaya 19,000 feet. It varies somewhat with change of season, latitude and elevation.

There is likely to be trouble from strikes at the Duquoin collieries. There is to be a meeting between the miners and colliery owners next Monday.

NINETEEN men were killed last week by an explosion in the Ashley coal mines at Wilkes-Barre, Pa.

FIG. 12.—GREENLAND INLAND ICE.

The Pittsburgh Boiler Scale Resolvent.

THIS Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK, Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berrymann Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad.

Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern; Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT
PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or other ore crushing machines now before the public.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

The following brief list by telegraph, for May 20, will appear more complete on receipt of mail advices:

California—Truman C. Naramore, Los Angeles, wave motor; Casey Newhouse, Modesto, and L. Hansen, Newman, sofa belt; Andrew J. Oliver and E. Wren, Oakland, wagon-jack; John C. Ludwig, assignor of half interest to A. C. Paulsell and M. Corcoran, S. F., T. C. Coogan and H. T. Compton, Oakland, telephone; Edward and P. Maloney, S. F., borshoes; Joseph B. Jardine, S. F., apparatus for reducing bituminous rock, etc.; Charles H. Fox and M. Hegele, Delano, bottle-stopper; John H. Hanson, Oakland, barrow; Carl Buchmiller, Pasadena, grass receptacle for lawn mowers; Herbert W. Adams and P. N. Tyron, S. F., veil-fastener.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

THRASHING MACHINE.—James E. Beach, Rontier, Sacramento Co. No. 427,660. Dated May 13, 1890. The operation of this attachment is as follows: The chaff and such grain as still clings to it are blown off of the shoe and over its receiving auger and on to the lower end of a carrier belt. By this it is carried upwardly, the grain disengaging itself and passing through the perforations of the belt, being assisted by the shaking movement to which the belt is subjected, and said grain falling upon the directing board beneath the carrier, runs down and into the second conveyor, from which it is directed into the elevator to go through the machine again as usual. The straw and chaff are carried up over the end of the carrier and discharged in substantially the same pile as the straw from the main straw-carrier above.

TYPE WRITING MACHINE ATTACHMENT.—Henry O Hooper, S. F. No. 427,688. Dated May 13, 1890. This attachment for a type-writing machine is for the purpose of enabling the writer or operator to inspect the work as fast as the letters are formed, and without stopping and turning up the carriage for this purpose. It consists of a refracting prism supported beneath the impression roller, and the sheet which passes around it, in such a manner that the refraction of the light through the prism will present the letters in their proper position to the eye of the writer.

WATCH.—Heinrich Albert, Lauenstein, Germany. No. 427,653. Dated May 13, 1890.

This relates to one of that class of watches in which separate dials are provided for indicating the hours, minutes and seconds. It is the intention in this watch to use a spring of a sufficient length to exert its power for a longer time than is usual. To employ such a spring necessitates the use of a larger barrel; but a barrel larger than usual can only be employed by throwing the minute-hand arbor out of the center of the face-plate. This is the reason of the peculiar construction adopted by this inventor, and by moving the center of the minute-hand down, space is provided for a more than usually large main-spring barrel. A spring can therefore be used long enough to provide for a continuous operation of the watch during any desirable length of time—as, for instance, four days or more.

MIXER FOR EXPLOSIVES.—Wm. R. Quinan, Pinole, Contra Costa Co. No. 427,707. Dated May 13, 1890. This invention relates to the art of making gunpowder and dynamite, and it

consists of a steam-jacketed tube through which the composition is passed and a stirrer, conveyor or mixer operating within the tube. The object is to produce cheaply and continuously a composition which is to be used directly as an explosive or as a dope to which a percentage of nitroglycerine or other explosive is to be added to give it the necessary explosiveness. The invention relates only to compositions which contain one or more ingredients that can be melted or softened by a moderate heat, which ingredient serves to cement or aggregate the particle of the composition into grains. The apparatus is designed to melt or soften this ingredient and mix it with the others, so as to form by a continuous process a plastic mass which can be readily grained. In ordinary gunpowder or black blasting-powder the sulphur is such an ingredient. The apparatus can also be used in preparing the dope for certain classes of dynamites or those which contain a small quantity of nitroglycerine. In these sulphur may be used as an ingredient; also resin, paraffine, asphaltum and various other substances. In preparing fire explosives such as gunpowder, the ingredient should be pulverized as finely as possible and mixed in the proper proportions before being passed through the apparatus. The finer the material the more intimate the incorporation effected by the apparatus and the better the power. In making the dope for dynamites or other detonating explosives the ingredients need not be ground fine, but should be mixed in proper proportions.

MACHINE FOR SEWING UP THE MOUTHS OF FILLED BAGS.—Thos. J. Daniels, S. F., assignor to Sperry & Co. No. 427,750. Dated May 13, 1890. This sewing machine is specially devised for the purpose of closing and sewing the mouths of flour or other bags after they have been filled, with the view of closing the bags with a peculiar stitch, so that after having once been opened and the contents removed the bags cannot be filled with inferior goods for the purposes of deception.

FRUIT-GRADER.—Wm. C. Hamilton, San Jose, No. 427,687. Dated May 13, 1890. The object of this invention is to provide a simple and effective grader, and one which is not liable to become clogged. The separated fruit drops into different receptacles below, and is by them discharged through the gates into suitable receptacles.

STREET SWEEPING MACHINE.—Mathurin O. Robichan, San Francisco, Cal. No. 427,795. Dated May 13, 1890. This machine involves the novel principle of throwing the dirt upwardly and backwardly over the top of the brush, into the base of the elevator, and thence carrying it directly back and discharging it into a delivery spout at a rear. It is usual to locate the elevator in front of the brush, which necessitates the forward trend of the elevator and the use of other elevators and carriers to get the dirt back again to the rear or side discharge. But in this machine, the elevator hehind the brush, there need be but one elevator, inclined directly backward. Side brushes and a gutter-brush, and power-transmitting mechanisms to operate all the brushes with the proper speed, are also provided, together with several adjustments of the various parts.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports:
Cons. California and Virginia, May 22, \$43,641;
Mt. Diablo, 22, \$13,917; Hanauer, 14, \$3825; 17, \$3350.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

THE Salt Lake Tribune says a fine ledge of lithographic stone has been discovered near City Creek Canyon. It has been tested in New York, and pronounced equal to the stone of Bavaria.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 22, 1890.

General trade is fair, but it would be far better if there were not an undefined uneasy feeling regarding tariff legislation, and what action Congress will take looking to the remonetizing of silver. Among leading manufacturers and prominent business men the belief is freely expressed that it is only cheap raw material or else cheap labor that will promote general prosperity in manufactured goods, although they say that by remonetizing silver a stimulating effect on all speculative securities and the leading farm and mining industries will inevitably follow.

Money continues easy under fair remittances from the interior, and a slow call for funds. There would be a freer inquiry for money were it not for the disturbed labor market. It is very generally claimed that considerable more coin will be required this year to move the wheat crop (which promises to be fully as large as that of last year) than has been wanted for all of two years past.

The steamer for Hong Kong sailed the past week, taking out the following treasure: Mexican dollars, 601,037; gold coin, \$20,155; and gold dust, \$600.

MEXICAN DOLLARS.—The demand for shipment by the China steamer was quite active, sending prices to a still higher range. The market held strong from 8@8 1/2 cents for round parcels, selling over the counter at an advance on these quotations.

SILVER.—The market has shaded off under published reports that President Harrison is unfavorable to any action by Congress looking to the remonetizing of the metal and also that he wants a party silver bill and not a national one. His course is no doubt alienating from him a large class of citizens who heretofore were his firmest supporters. With the Comstock mines running more to gold as the assays now show, it is singularly strange under what influence he is when expressing fears of remonetizing silver. Of course he is personally silent, so that his objections cannot be overcome by arguments based on sound principles, the chief of which is the revival in many lines of trade on the possibility of silver advancing to par. It is not the mining industry alone that is to be benefited, but all others, either directly or indirectly. In the local market silver has held steady at \$1.03 1/2 mint quotations. New York came through to-day at \$1.03 1/2.

QUICKSILVER.—Receipts the past week aggregate 154 fl. sks. The market has made another upward move, closing strong at the advance.

BORAX.—Receipts the past week aggregate 224 cts., and shipments in last month, by overland railroad 1228 cts. The market is easing off under freer production and more offish buying.

LIME.—Receipts the past week aggregate 4865 bbls., and exports by sea 200 bbls. to Honolulu. The coast demand is off, owing to labor troubles in some sections and fears of trouble elsewhere.

LEAD.—The local market is strong at an advance. Eastern advices report a strong and higher market under a legitimate demand by consumers who are short in stock. The past week there was exported by sea 22,063 lbs. to Victoria, and 225,094 lbs. of white lead to New York.

IRON.—The market shows another appreciation in price. Eastern advices report an active distributive trade, with a decided speculative movement on foot, due, probably, to an expected increase in the duty. Exports the past week aggregate 2027 lbs. to Victoria.

COPPER.—The market holds strong. Our Eastern advices report a strong market with heavy sales for export. The Iron Age of May 15th has the following London cable: "Prices for copper have continued to steadily advance under the influence of gradual increase in business and revival of speculative interest. Bars have risen £3 during the week and are to-day at nearly the highest point."

IRON.—The market is essentially unchanged. Foundrymen are consuming more, yet the liberal stocks here and cheaper outward English freights are against the market. The English market is controlled by speculation regardless of the stock, which is said to be low.

COAL.—Imports the past week aggregate as fol-

lows: Newcastle, 230, S. W., 8060 tons; Departure Bay, 5140; Tacoma, 2300; Nanaimo, 848; Seattle, 2700; Coos Bay, 7504; total, 19,798 tons. The market is easier for Australian and English for prompt loading. The dull freight market abroad and prospective large wheat crop on this side will attract ships to us. In coast coals there is nothing new to report. The long-threatened labor strike at the Wellington collieries has come, but it is claimed that it will be short-lived; at any rate, the trade does not appear to fear any appreciation in that grade of coal in consequence of the strike.

Mining Share Market.

The mining share market the past week was quite active, with lively fluctuations at advancing prices. The way in which some of the stocks jumped up and fell back caused the more credulous to believe that the ore body was being moved from mine to mine at a lively rate, so as to give all a show. The active up movement was naturally expected by careful operators. This we predicted in last week's PRESS, for the mill-ring and pool bought stocks on the down grade, which they wish to sell out so as to collect the ten assessments, aggregating about \$250,000, that fall delinquent in the forefront of next month. Of course, if the public does not take the stocks at the figure the pool would sell at, still higher prices will be made to induce buying, after which—well, what has always followed: low prices and more assessments later on. The mines were never in better condition than at present for a sterling deal, for the pool or ring can run into ore at any time, so as to give an excuse for higher prices, and they can, with equal ease, run out of ore, so as to break prices, and at the same time get away with the boodle. The public need not expect a different condition of affairs until there is a change in the management of the mines. Stock brokers should do all in their power to bring about a reform, and no broker having any regard for his good name, unless he is in the boodle-ring, should give proxies for stocks standing in his name over which he has no control. Elections are coming on, and it is policy to let those who wish the boodle buy the stock for control in the open market, and then we can look for more active times.

The mill-ring continues to grade the ore milled on the Comstock, so as to keep off dividends and get more boodle. It is reported that the last quarterly boodle division aggregated over \$700,000.

From the Comstock, our Virginia City advises report that the pumps for pumping out the Gold Hill mines will be in place about the 1st of next month, and that pumping will commence soon afterward. Our correspondent also says that the most important strike on the Comstock for years is the west ore body in the Gold Hill group of mines, commencing with 10 or 12 feet of ore found, last December, in Con. Imperial, near the Alpha south line, on the 300-foot level, and later on in the upraise from the 500-foot level on the same body found in Confidence and Challenge, followed by the last find in Confidence, 250 feet west from the 800 lateral drift that is being run from Yellow Jacket to the Con. Imperial shaft. They have started a west crosscut on this level in Challenge near the north line, to prospect the ore found in Confidence, in Crosscut No. 1, mentioned above.

A reliable person informs us that in Overman, on the Suro tunnel level, they struck, some time since, a body of rich ore lying west, when they came back and sunk a winze 70 feet deep from the bottom of which a northwest drift was started to tap the ledge lower down. In running this drift they encountered the ore body, which was about 40 feet wide, the average assay of which was about \$50 a ton. Our informant thinks that the present management, if they keep control of Overman, will mill for themselves and grind out assessments for mine stockholders.

Con. Virginia has sent to the Carson Mint, to date, over \$56,000, and Crown Point over \$10,000, on May account.

We learn from a reliable source that there is a decided improvement in Savage and also in Hale and Norcross. In Potosi, the improvement in the winze mentioned by us, week before last, is officially confirmed. Chollar still shows well. An improvement is also reported in Overman.

THAT COPPER SYNDICATE.—At the trial, in Paris, of the Copper Syndicate men it has been proved that Secretan, as director of the Societe de Metaux, distributed fictitious profits for 1887 and used improper means to haul copper, raising the price from under 1000 francs per ton to over 2000 francs, and clearing within two months 10,000,000 francs. The defense is that the article of the Penal Code on which the charge is based does not apply. Ilentash, on being examined, admitted that while he was chairman he knew nothing of the dealings of the institution with the Societe de Metaux. He also testified that the Board rarely listened to the manager's reports and let things slide.

ACADEMY OF SCIENCES.—At the meeting of the California Academy of Sciences on Monday evening, Fr. Gutzkow exhibited some specimens of manganese ore found at the junction of Nineteenth street and the Corbett road. The deposit was referred to in Prof. Whitney's Geological Survey report, but has of no commercial value. C. E. Engerman read a brief paper on "Egg Membranes or Covering of Eggs in Fishes."

Assessment Notices.

ACME MILL AND MINING COMPANY; Location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of June, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. HUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

The delinquent day of the above assessment is hereby POSTPONED to June 2, 1890, and the day of sale to MONDAY, June 23, 1890.

By order of the Board of Directors.
J. M. HUFFINGTON, Secretary.
San Francisco, May 15, 1890.

GRAY EAGLE MINING COMPANY, Location of principal place of business, San Francisco, California. Location of Works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of May, 1890, an assessment, No. 17, of five (5) cents per share, was levied upon the Capital Stock of this Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of June, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of June, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. HUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

GOLD HILL MINING COMPANY—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of April, 1890, an assessment (No. 9) of Twenty-five Cents per share was levied upon the capital stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, Room 20, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of May, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 10th day of June, 1890, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
C. A. GROW, Secretary.
Office, Room 20, Phelan Building, San Francisco, California.

Holland's Corrugated Woolen Belt Ore Concentrator

(PATENTED)

Will save more fine gold and flour quick than any concentrator ever made. Will also concentrate cinnabar and gale a ore perfectly and with economy. The invention is new and possesses all the advantages of the old blanket system, while avoiding its faults by the use of the Corrugated Woolen Belt, which is thoroughly cleaned by means of a revolving brush connected and operated with the machine. It is simple in construction and cannot get out of order. Small power is required to run it.

Price of Concentrator for Ten-Stamp Mill, \$1000; for Five-Stamp Mill, \$600.

For Circulars, address H. P. HOLLAND, 2322 Folsom Street, San Francisco, Cal.

Fig. 13.—AN ICE ARCH OR NATURAL TUNNEL UNDER A GLACIER.

The Deep Gold Placers of California.

NUMBER IX.

[Written for the Press and copyrighted 1890, by HENRY G. HARRIS, F. G. S. A., F. G. S.]

Glacial Rivers.

There are natural tunnels and passageways under all glaciers, through which streams born of the snows rush with great impetuosity. These are known to Alpine travelers as "ice arches." Fig. 13 is from Cox's "Travels in Switzerland."

Running water adds to the working capacity of the glaciers. The torrents at times flow on the surface, at others plunge down the crevasses in cataracts, carrying sand and stony fragments which, impinging on the generally soft bedrocks, wear away the surface and form the so-called "pot-holes," in which, when uncovered centuries afterward, worn boulders and gravel are found at the bottom of this natural hydraulic shaft, revealing the agencies employed by Nature in this work. The crevasses naturally close or move on and appear like empty mining shafts, the water finding a new opening. The pot-holes are hurried out of sight and remain as occasionally discovered by the venturesome drift or hydraulic miner of the present time.

On the ice-worn coast of Norway, pot-holes of unusual size are found uncovered, which no doubt were so formed, and the supposition is that very many more exist which are hidden from view; they are called "giant kettles."

Under favorable conditions, pot-holes are sometimes formed in river-beds. This may as likely take place under a glacier as in the bed of a modern river free from ice.

Small streams generated by the melting ice

also flow over the surface of glaciers, descend through fissures and connect with the torrent beneath. When a large stream plunges down a crevasse cataract-like, it is called the "glacier mill" or "monlin."

Numerous sub-glacial streams, four of them of considerable size, flow under the Alaskan Muir glacier. These are about three feet deep and from 20 to 40 feet wide. The grade is from 150 to 250 feet to the mile, which causes a very rapid current. The deeply-running river beneath the ice can be distinctly heard by a person on the surface. (Wright's "Ice Age in North America.")

In Greenland, great rivers flow in summer over the ice sheet and are precipitated down gigantic crevasses.

This universal presence of flowing water

under glacial ice will account for all river phenomena noticed by miners and scientific observers in the deep channels of California, and it is not surprising that early gold miners should attribute them wholly to fluvial action.

The following are quotations from Tyndall, Cox, Geikie and others, pertinent to this subject:

"Having admired the Arch of Ice," etc. . . .

"A glacier so covered with earth and stones as to hear at a short distance the appearance of a small hill is seen. From this glacier issues a torrent roaring loud, of troubled water which is the source of the river Aar." . . .

"The Aar rushes with more impetuous rage than even the Rhone or the

Rhone, and it is frequently so swelled with torrents as to ravage all the surrounding country. We saw many traces of these terrible devastations."

. . . "Arrived at the bottom of the inferior glacier forming a magnificent arch of ice from which issued a noisy, rapid torrent of snow-water."

"The river Arve is joined by the Arveiroo, near Chamouni; the latter emerges from a glacier (Glacier des Bois). An ice cliff has an arch from which this river seems to have birth, the roof of which in summer is continually falling."

"A torrent the first source of the Rhone, in summer, is turbid; in winter is transparent as crystal. When the accumulation of snow prevents it from flowing under the glacier of the Furca, it forms a lake; overflowing, it flows over the ice and continues on its course; the Rhone running beneath the ice could be distinctly heard." . . . "During some seasons the river Rhone, a gray torrent of snow-water, issues from an ice cavern."

"The Rhone hursts in two streams from the bottom of this glacier; although scarcely three feet deep, the water rushed with such violence as nearly to overturn the guide."

"It was curious to observe the numerous little rills produced by collection of drops occasioned by the thawing of the ice on the upper part of this glacier." . . . "These little rills hollow out some channels, and, torrent-like, precipitate themselves into the chasms, increasing the body of water formed by the melting of the interior surface, which, finding an outlet under the immense arch of ice, flows into the valley of Chamouni," etc.

Rivers, many of which have their sources at the feet of mountain glaciers, follow any accidental depression that may have been formed by the prime causes already referred to. Water can by no possibility rise over intervening high lands, but must find its way as best it can always downward to the sea.

A crevasse is at first a crack in the ice which widens with the plication of the mass as it flows over the irregular bedrock below. The yawning crevasses have their origin in similar fissures. The first manifestation of a new fissure, according to Tyndall, "is a sound like an explosion, followed by the rising of air bubbles."

Fig. 15.—CREVASSE, GRAND PLATEAU.

Fig. 14.—CREVASSE, MER DE GLACE.

The first crack is so narrow as scarcely to be seen; it is in no place wide enough to allow the insertion of a knife blade."

The cracks widen as the ice stream flows, until they form broad and deep chasms extending to the very bottom of the ice mass, moving with the ice river. Sometimes they quite close again, and are obliterated long before their position reaches the termination of the glacier.

They often connect with the bottom of the glacier beneath which the river flows with greater impetuosity than in open channels. Down these openings whole trees are carried by the powerful streams which by the same force are stripped of their branches and left on the bedrock by the retreating crevasses, to become in after ages the lignite and silicified wood which the California gold miner pipes out of the hydraulic banks, or the drift miner meets with in his tunnels far underground. The same road could be traveled by the bones of ancient animals, and if it is true that human implements are sometimes found under conditions not formerly well understood, may not this be at least a reasonable supposition as to their placement?

Moulines have been sounded for 100 to 300 feet without finding bottom.

In the valley of Hasli, the river Aar plunges down a crevasse 200 feet deep.

In 1820, three guides were swept by an avalanche into a crevasse on the side of Mont Blanc; forty years after, their bodies were found near the terminus of the "Glacier des Bossons," miles below the crevasse into which they fell. Fig. 14, after Gaikie, represents a crevasse in the Mûr de Gace. Fig. 15, is from Tyndall's "Forms of Water."

Incipient or Snowdrift Glaciers.

While the working capacity of the true glacier is admitted, we may not ignore the effects produced by small patches of snow which come and go with the seasons. Lying for a time on the steep mountain-sides, too transient and too small to be dignified by the name "glacier," they yearly perform their humble labors, and in the aggregate, by dint of constant work while they last, contribute much to the detrital matter found in the true glacial channels, the canyons and watershed of the lower foothills and plains.

I had an opportunity to note these baby glaciers during a recent visit to Pinamas and Sierra counties. I was surprised to find them all at work, a fact demonstrated by the small muddy stream that issued from the foot of each. A close examination showed that matter was being loosened from the mountain-sides by the slow downward movement of the snowdrift, and carried away in water melted from the snow by the warmth of the sun. That the snow patch was actually moving, glacier-like, was proven by curved lines on the surface. This discovery led to the thought that the work of these snow bodies, continued for centuries, might materially assist in the great geological work, the evidence of which was seen on every side.

The amount of mineral matter crushed by creeping ice, and washed away by mountain ice-born streams, is enormous. The effects of this stupendous work may be seen almost everywhere in the high Sierra Nevada mountains of California. I have from Spanish Peak looked over to Pilot Peak, and from Pilot Peak back to Spanish Peak, across the great undoubted glacial erosions of Pinamas county, a sight well worth the journey to the locality. A sketch view is shown in Fig. 16. [This cut was incorrectly placed on page 337, in Article No. VII of this series, and is here reproduced. The cut which should have been given, on that page is Fig. 7, which is shown in this issue.—EDS. PRESS.]

The following facts, selected from works on this subject, are illustrative of the great geological changes wrought by ice:

"From the foot of the Aar glacier, with a computed area of 60 square kilometers, not the largest in Switzerland, 440,000,000 gallons of water, containing 280 tons of sand, flow away daily in the month of August."

"The Justedal glacier in Norway discharges one million kilograms of sediment in one July day, and the total annual discharge from the ice-field, covering 830 square miles, is estimated at 180 million kilograms, besides 13 million kilograms of mineral matter in solution. Assuming the specific gravity at 2.6, the basin of the glacier is believed to lose 69,000 cubic meters of solid rock annually, or a cube measuring 41 meters a side."

Prof. Wright estimates the whole annual sediment conveyed to the bay by the sub-glacial streams of the Malak glacier in Alaska at 33,274,804 cubic yards. "This would furnish one inch of sediment per year to be spread by this single glacier over the bottom of Glacier bay, confirming the recent recession of the glacier from the lower portion of the bay, since otherwise it would now be filled with sediment. There are four other large glaciers now entering the inlet."

Glaciers frequently scoop out lake basins or increase the depth of natural depressions. Many attestations of this fact may be seen in the Alps. Some of these lakes cover a large area, and like Lake Tahoe in our own State, are very deep. Lake Maggiore in Italy is 1233 feet deep, 35 miles in length, and from 3 to 7 miles wide; the surface is 640 feet above sea level. The Lake of Como, also in Italy, is 30 miles long and its extreme width is 2½ miles. Its greatest depth is 1341 feet, but its average depth is much less. The Lake of Geneva in

We admit, unadvised, opinions of correspondents.—EDS.

Note on Expelling Coarse Sand From Settlers.

[Written for the P.M.S.]

If settlers were made on the principle of the rough one described in my little book on "Testing and Working Silver Ores," there would be less difficulty in getting the coarse sand out, and any lumps of rock or iron, keys, etc., which might and often do find their way into the settler, would be taken care of without trouble to the attendant or injury to the machine.

When I took charge of the mill here, I found a number of boxes full of coarse material which included a large quantity of quicksilver. This had been removed from the settlers from time to time as it accumulated in them, and had been something of an elephant on the hands of the millman whose only method of disposing of it, to a greater or less extent, was to regrid it in the pans and again wash it in the settler.

An experienced panman who worked here knew of no better way until I taught him the method which I discovered many years ago, and have used with satisfactory result, even with the unscientific settlers usually supplied with mills. This method is as follows: Drive the settler at high speed as possible without injury to other machinery (batteries may be hung up for a time if necessary); fill it with water; remove a plug at about half-way between the surface and the bottom of the water, and in its place put a half or three-quarter, etc., plug. The object is to allow the water to escape as fast as it enters (and that should be as fast as the supply pipe will deliver it) while still keeping the settler full. Very coarse and heavy sand will rise to the outlet and escape, as it would never do if the outlet were not considerably below the surface of the water. In about an hour the accumulated coarse, heavy sand from several days running in the ordinary way will be expelled, and no quicksilver will be lost. If there remains a little still coarser stuff, as lumps of rock, etc., it must be removed by hand after stopping the machine.

The knowledge of such little things as this contributes to the difference between a good millman and a poor one, but I think this will be a pointer to several pretty good millmen, and may be so to some manufacturers of settlers.

The principle of a settler to which I allude above, and which is but imperfectly carried out in any settler in the market that I know of, is:

1st. By rapid motion and suitable arrangement of the stirrers, all granular matter is kept suspended in water, circulating upward at the periphery and downward near the center until the diffused globules of quicksilver have united to form masses too heavy to be lifted by the current.

2d. A deep groove surrounding the false bottom affords to these masses of quicksilver, as soon as they become heavy enough to remain in it, a refuge from the disturbing action of the stirrer.

3d. The construction of the arms and their arrangement is such as to sweep the bottom from the cone to the circumference, slightly rubbing the quicksilver in the pulp to make it unite, and pushing it, as well as rocks, pieces of iron, etc., into the groove, while the false bottom projecting over a part of the groove forms a recess into which the rocks, etc., are forced by the reactionary water current, there to remain until removed by the operator.

In case of granulation of the quicksilver, certain more or less known chemical effects may be utilized to assist its agglomeration.

With a settler of this kind it is never necessary to remove the lowest plug until the water has to be drained out, and if the quicksilver is in good condition the loss is not greater (it may be less) than with the ordinary machine, for no settler can save granulated quicksilver unless it retains also a quantity of sand.

All this is explained in the little book mentioned, and though that book is now to a great extent out of date, it is not so in this matter, for I have yet to see a really good settler for silver mills on this market. The worst settlers are those which have plowshares and cultivators which only plow up the sand and quicksilver together; the miller settlers, with wooden blocks, are not so bad.

Santa Lucia, Honduras C. H. AARON.

Mines and Mills of Shasta County.

NUMBER III.

[From our Traveling Correspondent.]

When I last wrote I was on my way to Shasta town, the once liveliest, wealthiest place in Northern California. It is now a silent camp, comparatively, still there are a number of nice, well kept residences, good hotel, several stores, post and telegraph offices, and a live and very readable newspaper, the Shasta Courier. Business comes more from the surrounding camps than the town, as the population is not over 300, I think. The main feature of the place is that it is the location of

the U. S. Land Office for this district, but this is now ordered to be transferred to Redding. Shasta is by all odds to be preferred to Redding in summer months. Here the water is fine, the weather fine, and the scenery grand. Shasta, as I see her, with a large though undeveloped quartz interest surrounding, will never be any worse off than at present. If they would develop the mines here, as they would the same properties in any other county of the State, Shasta would be to this, as Grass Valley is to Nevada county, a very lively, beautiful mining town.

It is useless to give any detailed account of the several, I will say many, quartz lodes I saw, some of which by development would no doubt make good mines; there are plenty of them within a radius of three miles around Shasta. The main drawback is want of water in summer, but this should be no obstacle, as the Sacramento river is within 3½ miles, and all downhill. The time is coming when along the borders of the Sacramento river is going to be the seat of the greatest gold-producing sections of the State, for the reason that it flows through a long section of mineral country—all through Shasta and well into Siskiyou county. It is a never-failing stream and has an abundance of water at the lowest stage in summer, and from Redding up there is a lively current that can be utilized for power by current float wheels.

The principal mining plant in the vicinity of this town is the Iron Mountain Company, located some seven miles north. The lode is an immense one, in some places over 100 feet wide, carrying copper, silver, lead, and gold, with iron sulphurets in immense quantities. The ore is worked mainly for its copper and silver, or rather I should say, for the silver with the copper. It is first crushed dry, then roasted in revolving furnaces, and worked in pans with quicksilver, making of course poor bullion, and a heavy loss of mercury. If this mine was in Colorado, Hill would make it; they would do the same in Montana, and why would it not be the best way for California? Then sell the matte to refiners. I will not undertake to give an account of the underground workings, which are quite extensive.

The mill consists of 20 stamps, 16 combination pans, and any amount of accompanying machinery. They have steam-power, and fine engines and boilers. The buildings and mine give evidence of there having been a large amount of money expended. This may be considered rather a meager description for so large a plant, but in the absence of Mr. Saltee, who is superintendent and one of the owners, it was impossible to get all that might have been had by consulting him.

There is a shyness among employees in giving information, which they are not to be blamed for, nevertheless it sometimes is well to talk a little. It doesn't matter much, as your correspondent can pick up enough with his eyes for practical and instructive purposes.

Mount Cory Mill.

The \$750,000 mill and reduction works just dismantled at Mount Cory, Esmeralda county, Nev., was the largest structure of the kind in the State and covered an area of several acres of ground, and several million feet of lumber were consumed in its construction. Rollers weighing 13 tons were used in place of stamps for crushing ore. The mill was a dry crusher, and after the ore was pulverized it passed through a series of screen apartments and dust chambers, and was finally conveyed into huge redwood tanks to go through a chemical process.

The failure of the Mount Cory ore to pay is attributed to its containing a large percentage of lead, the silver escaping with that metal, from which it was impossible to separate it by the process adopted at the Mt. Cory mill. Its complicated construction is illustrated in the statement of a Candelaria mine-owner who says he shipped 50 tons of high-grade ore from that district to the Mt. Cory mill for reduction. After the ore was dumped into the feeders or hoppers, nothing was ever afterward seen of either the ore or the metal it contained, and it is supposed that the pulverized ore was blown away in passing through the dust chambers.

The site of the mill is located several miles from the mine, where there is neither fuel nor water, whereas at the mine there is plenty of both. There is no mineral patent on the Mt. Cory mine, but it is covered by a timber patent including 3000 acres, and is therefore not relocatable.—Virginia Chronicle.

LITTLE VALLEY.—Two experienced prospectors are preparing to start for the head of Little Valley, west of Franktown, as soon as the snow disappears, to search for the quartz vein from which the gold drifted, found in the ravine near the old Marlette millsite, which was worked by the hydraulic process in the early "sixties," and is said to have yielded \$160,000. Quartz surface-croppings are visible at several points on the divide separating Lake Tahoe from Little Valley.—Virginia Chronicle

The Virginia Chronicle says: A measurement of the water flow of the Carson river by United States engineer corps officers shows a volume of 2508 cubic feet (equal to 125,000 miners' inches) at Rodenhahz, and 30,000 at Woodford's.

Coast Industrial Notes.

BASALT BLOCKS are no longer in great favor for paving, the tendency being toward bituminous rock.

The cable for the Piedmont cable road has arrived, and an experimental car has nearly been completed.

THERE are several hundred men employed in this city in working tin and sheet iron and in making metal cornices for buildings, etc.

IN surveying the Grand Canyon of the Colorado for a railroad, Engineer Stanton and party ran a line across a natural bench of white marble that extends 20 miles down the canyon. It is wide enough for a four-track road, and is at the average height of 80 feet above the river.

THE United States is at present the only good market available for canned salmon, mainly on account of the low prices prevailing. The principal demand is for Alaska fish, the greater part of this year's pack of which will probably remain in the United States, although a very considerable portion is of inferior grade. Of late years a trade in second-class brands has been worked up in the Southern States.

AUTHENTIC reports from the oil-fields in Ventura county are to the effect that considerable excitement has been caused there by an increased flow in many of the oil wells. In three wells the flow increased over 200 barrels each in one week. A number of Pennsylvania parties are looking over the field and speak very highly of the prospect. Considerable money is being invested in development.

THE revenue from the manufacture of whisky has entirely ceased, the local distillers having been totally frozen out by Eastern competition. As one of the men who was once in this business put it: "The tax on whisky is 90 cents per gallon, and Eastern men sell whisky here for \$1.05. Now, they either furnish the whisky, the casks, and pay the freight out of that odd 15 cents, and still make a profit, or else —," and he shrugged his shoulders.

THE merry buzz-saw is now mangling the saw logs, and the tuncful hum is pleasant music. The Truckee Lumber Co. started their mill Monday, and the Boca mill commenced work yesterday. Geo. Schaffer was intending to commence to day. The other mills will start up in a few weeks. Most of the mills have logs enough on hand to last a month or six weeks, and by that time the loggers can get into the woods for a fresh supply.—Truckee Republican.

THE beet-sugar industry at Alvarado is to have its capacity doubled, so that 300 tons of beets can be handled per day. New machinery will be put in, and it will then require 12 boilers to run the mill. The present company this year pay out \$120,000 for beets alone. Over 1500 feet of beet-sheds will be constructed at once. They have already let contracts for 1500 acres of beets. The total expenses this year will run up between \$250,000 and \$300,000.

DURING the past week or so there is noticeable a very marked falling off in building business. The number of contracts let has diminished perceptibly, and the cause is said to be the introduction of the eight-hour movement, which is equivalent to an increase in the cost of labor amounting to one ninth. Architects mention the fact that intending builders have declined to carry out their intentions on account of the change of hours. What diminution there may be on this account is added to by the approach of the holiday season and the attention being devoted to summer pleasures beyond the city.

SOME fine blocks of marble are being taken out at the Inyo Co. quarry. One of these weighs 15½ tons; it is a beautiful stone without a flaw. Much larger blocks could be taken out if it were possible to ship them. There is a block of moss-agate marble ready for shipment that weighs ten tons. The beauty of this stone cannot be duly appreciated without being seen. The mill for working the marble will be provided with the very best machinery and most improved appliances of all kinds. It is a serious loss to Owens Valley that the mill is not located there, instead of at Verdi, 350 miles away from the quarry.

NEAR Cordella, or Bridgeport, Solano Co., for several years past, there have been from 50 to 150 men employed on the low hills getting out paving blocks for San Francisco and other cities. It was a thriving and busy community, and the few business men in the place were prosperous. Quarrymen and blockmakers received from \$2.50 to \$4 per day for their labor, and Bridgeport resembled a mining camp of the early days. Now this is all changed. Rent advances from there would seem to indicate that the quarry business is dead, and perhaps never to be resumed. So far the present season has not been an auspicious one at Bridgeport. The hills are tenantless.

AN examination of the Internal Revenue Collector's books discloses a remarkable falling off in the amount of the receipts from the tax on cigars. From 1882, when a total of \$988,606 was collected, to 1889, when only \$389,352 was paid into the office from this source, the decline has been steady, and about in an even proportion each year. Of course this reduction in revenue meant a corresponding reduction in the manufacture of cigars. A reporter interviewed several cigar manufacturers as to the reason for the falling off, and all predicted a dismal future for the business. They ascribed

its decline on the coast to their inability to compete with Eastern firms, and also to a prejudice against Pacific Coast cigars, because of the impression abroad that they are all manufactured by Chinese labor.

The mill-owners of Oakland are quietly waiting for June 1st, when the day of proceedings granted by the Carpenters and Joiners' Union ceases. This union has adopted a resolution enjoining the members from working with non-union men in the same building, or planing-mills, or stair shops, under penalty of fine or expulsion. The mill-owners have adopted, in view of this, the following: *Resolved*, That in order to counteract and nullify the effect contemplated by the resolution adopted by the Carpenters' Union, we mutually pledge ourselves, one with another, that we will not hire any man (for at least two weeks) who combines with others to bring about a strike on any building, in any planing-mill, or stair-building shop because of there being non-union men employed in those places; and he it further *resolved*, that every contractor, mill-

the machines tried had bruised the fiber, and the use of water was necessary to work it by that process. The Van Buren gets the fiber out in perfect condition, and there is no water required. The company's plants average about four feet in height, with leaves measuring 18 inches in width. In the 18 months the doctor has given to the study of the industry, he has come to the conclusion that for commercial purposes the maguay should be gathered early in the year. The company have built a good wagon-road to the coast, twelve miles distant, where, at Santa Rosalia bay, they have one of the best harbors on the lower coast. Livingston & Clark's vessel now carries mail for them. It is undecided yet whether the fiber, when dry, will be shipped direct from Santa Rosalia to England, or San Francisco and reloaded for the old country.

The German bark *Ventura* is due here from Antwerp with \$100,000 worth of beet-sugar machinery on board. The machinery was ordered by Claus Spreckels about a year ago, hoping to set it up in time for this year's crop

A Famous Manzanita.

(Written for the PRESS by J. J. RIVERS, University of California.)

The *manzanitas* form a pleasing and distinctive feature in the natural forest flora of California. There are nearly 20 described species suited to various altitudes and conditions. They flower at different seasons, but always add beauty to the locality that bears them by the tone of their shining bark of rich Turkey red and cinnamon brown that give so much warmth to the slopes and hills in many districts.

There are three species of *manzanita* that grow to the stature of small trees, viz.: *Arctostaphylos viscida* that reaches a height of 15 feet; *A. Manzanita* and *A. Glauca* that attain respectively a height of 25 feet and 6 to 7 feet in circumference. The specimen of *A. Manzanita* illustrated in the photo-plate on this page is of far greater dimensions in every particular. The circumference at the base measures 11 feet

that are diverse in habit. Consider the great *Arbutus menziesii*, a madrone which grows to the height of 100 feet, and from 20 to 25 feet in circumference, and then consider the beautiful scarlet snow plant of the Sierras, *Sarcodes sanguinea*; then those of culinary worth, the cranberry, the bilberry and the bear-berry, and the useful wintergreen; then come some for beauty and cultivation—those grand pot-plants the heaths of the African Cape and the Scotchman's heather, and from our Southern States the fine kalmia, and for California add the azalea and rhododendron, and one can form an idea of the wonderful variety in form and character which pertain to the order which includes the grand *manzanita* shown in the engraving.

OPENING A LUMBER RAILROAD.—The Towle Lumber Company is preparing to resume operations for the season, and a force of men are now opening and repairing the railroad from Towle's Station to the top of the ridge in the vicinity of Omega in this county. In clearing the road

ARCTOSTAPHYLOS MANZANITA (Parry): GROWING ON THE ESTATE OF TIBURCIO PARROTT, ST. HELENA, CAL.

owner or stair-builder, whose men shall leave for the above-named reason, shall give the secretary of this association the names of the men so leaving, and the secretary is hereby instructed to furnish the same to each member of this association.

The directors of the Lower California Land & Fiber Company, which owns large tracts of land on the peninsula about San Borja Mission, some 350 miles below San Diego, have re-organized their company and elected their former bookkeeper, Dr. C. Webb, of Manchester, England, as manager. He has ordered in San Francisco one of the new Van Buren machines for separating the fiber, and will begin work as soon as the machinery is ready. The maguay plant grows wild all over that region and is of as good a commercial value for manufacturing brushes, rope and sacks as the fiber which has brought wealth to Yucatan for over sixty years, and also to the Bahamas. In those sections it is called "hengnan." The growth of the industry in Florida, where this new separator is being successfully used, encourages the Land & Fiber Company to begin active developments after a half-dozen years of unimportant experiment. The doctor explained that heretofore all

of beets. The factory was to be a duplicate of the Watsonville mill, and one of the many mills which the Occidental Sugar Co. (in which the Spreckels hold a controlling interest) propose to erect in different parts of the State. The strike in France and Germany delayed the machinery, and now it comes too late for this season. Owing to the unsettled state of sugar matters and the action of Congress, it is doubtful if it would have been set up had it reached here in time. The machinery will be stored until the fate of the Tariff bill is determined. The Spreckels say that with free sugar and the bounty systems of Europe they will have to close their mills. Beet-seed has been in so great demand in this State that there is now no more to be distributed. It can be had in small quantities at 30 cents a pound. There are 2500 acres in beets near Watsonville this year. If the crop is as good as last year, there should be 35,000 tons of beets for the crusher.

It is proposed to build a large water-storage dam on Lynx creek, eight miles east of Prescott, A. T., for hydraulic mining and for irrigation purposes, at a cost of \$250,000.

6 inches; at 2½ feet above the base it yields a measurement of 11 feet 8 inches. Above this point the tree bifurcates each division, giving a circumference of 7 feet 5 inches; at two feet higher more forks occur where circumferences are plentiful that record 3 feet 9 inches, 3 feet 10 inches, 4 feet, 4 feet 6 inches, 4 feet 7 inches. The general height of the tree is 30 to 35 feet and the spread of the head is 36 by 30 feet.

This remarkable *manzanita* has a very proportionate growth—a habit not characteristic of the genus. It is growing on the estate of Tiburcio Parrott, St. Helena, Napa county. It is in deep, rich soil and in the vicinity of a spring. These facts suggest that it is not axiomatic to say that where *manzanitas* grow, the land is poor; but where large *manzanitas* grow the land is rich, and where small ones grow the land is poor; and this equally applies to many other trees. If, added to good land, the laws of forestry were applied to the trees, to induce the growth of longer lengths of timber, a rich and valuable wood would be added to the cabinet-maker's stock.

The *manzanitas*, belonging as they do to the order *Ericaceae*, have some very peculiar allies. California yields two very diverse congeners

last week the snow was found to be nine feet deep on the ridge between Towle's Station and Bear valley, but in the valley the snow is not very deep. In the Steep Hollow region the snow is yet quite deep. The company has a sawmill in Bear valley and one at Steep Hollow, at which sawing will be done the present season. This year the Bear valley mill will about use up the available timber owned by the company in that locality, but there are years of work for the mill at Steep Hollow, to be supplied from the timber in that vicinity and on the Omega ridge. Besides this source of supply, the company owns an extensive body of timber laid on the north side of the Yuba river, which will be made available in a few years. As soon as the railroad is cleared of snow the mills will be started up, but it will be from two to three weeks yet before men and teams can go into the woods to commence the work of cutting and hauling logs.—*Grass Valley Union*.

The hoisting-house, blacksmith shop, dry-house and office of the Hartley Mining Company, in Grass Valley district, were burned to the ground Saturday night.

MINING SUMMARY.

The following is mostly condensed from journals published to the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE GARDNER MINE.—*Dispatch*, May 24: Mr. Robert Stevens, one of the owners of the Gardner mine, states that it is the intention of the company to build a good mill on the mine right away. In fact lumber is already being hauled up for the purpose of putting up the necessary buildings to be used by the workmen while engaged in building the mill. We also understand that the company contemplate purchasing the McKenzie mine and other properties in that vicinity, all of which will hereafter be known as the Clinton Con. mine.

PLYMOUTH CON.—*Ledger*, May 24: Forty stamps of the Pacific mill are kept running steadily. Some 70 men are at work, and more are being employed almost daily.

NEW LONDON.—This mine continues to do well under the able management of Humphrey Reese. It gives employment to 80 men, and the mill of 40 stamps is kept moving to its full capacity. The prospects of Plymouth have materially improved with the revival of mining interests. The Reeves mine, we are told, is giving encouraging results, and good ore has been discovered on Alpine ground, and each of these properties will help to impart new life to Plymouth.

AMADOR GOLD MINE.—At this mine they are getting things in shape as rapidly as possible for the starting up of the mill. The rock-breaker is in place, the ore-bin is full of rock, the track to the mill is getting in order for the conveyance of ore, and everything betokens that the long-looked-for and much-deferred dropping of the stamps is close at hand.

MCKENZIE.—The Huntington roller-mill has been shut down, probably for keeps. The McKenzie brothers have gone to San Francisco for the express purpose of making arrangements for building a ten-stamp mill.

SUTTER CREEK.—The mines are running along in the usual way. Mr. Stewart has let a contract to sink a shaft some depth, the object being to strike the ledge at a lower level, which it is expected will develop the mine into a still better-paying property. The development of other mines in this vicinity, which has been in contemplation for some time, is expected to be started in the near future.

Calaveras.

BIG FIND.—*Prospect*, May 24: It is told that a find has been started on Wheats Ranch after a depth of eight feet was attained, which is the most wonderful affair of the kind ever known in this county. Mr. J. D. Cook brought into Assessor Luddy's office the other day a specimen of the ore from the discovery, and Mr. Luddy says it is the finest specimen he ever saw. At a later day we will give a detailed account of the mine.

BIG CLEANUP.—*Calaveras Chronicle*, May 24: We are informed that the Louie Star mine, after a two-weeks' run, yielded over 114 ounces. The future prospects of the mine are exceedingly flattering. It has a ten-foot ledge which, to all appearances, will furnish pay ore for years to come.

El Dorado.

GEORGETOWN.—*Gazette*, May 24: Idle men are scarce just now about this camp. As the season progresses the demand for laborers increases. The building of the new school-house and other buildings, in addition to the contemplated extensive improvements on the property of the California Water Co., will make lively times here this summer. Extensive mining operations are also in a fair way of being started up.

TUNNEL.—Work on the new tunnel on the Josephine mine at Volcanoville is progressing under Supt. L. Evans with favorable results. The new, or No. 5 tunnel, is now in 400 feet, running on the vein 1000 feet deeper than the deepest workings of the mine. At present they have two veins, one three feet in width on west side, and the other four feet thick on east side of tunnel, within a few feet of each other. Mr. Evans brought down samples of the quartz on Tuesday, which he sent to S. F. The ore from the east vein appears rich in silver as well as gold. The west vein shows well in free gold. The Josephine lode will be tapped at a depth of 1600 feet by this tunnel, and the best chute which paid so well above, has not yet been reached. Several promising quartz prospects in this vicinity are receiving the attention of parties in search of milling propositions. Al. E. Brass and Robt. Mohbert of the North Star gravel mine near Volcanoville, were in town this week. This mine adjoins the Flora mine. The boys have completed a 400-foot tunnel, the face of which is some 500 feet below the surface. They are now raising up for the bed of the ancient channel.

Inyo.

NEW BORAX DISCOVERY.—*Index*, May 24: Messrs. W. T. Grant and A. W. Nobles came from Salt Wells Valley, last week bringing with them samples of almost pure borax in the form of "cotton balls." The new discovery is over the ridge from Searles marsh and within a few miles of the Carson & Colorado railroad survey on the line of the proposed extension to Mohave. The find promises to prove valuable. The gentlemen named, together with Surveyor Seeley and Mr. Young, a borax expert, have returned to the scene of the new discovery.

Mariposa.

BEAR VALLEY MINES.—*Mariposa News*, May 24: The mining operations which have been carried on for the past two years under the management of the Mariposa Commercial and Mining Co. have been casually designated as "prospecting." The operations at the Pine Tree and Josephine mine near Bear Valley, show an amount of work performed which will surprise any one who may have the time and opportunity of investigation. Work was commenced under the present management in November, 1887, at the mouth of the English Trail drift. This was originally run in 1083 feet. The present company cleaned out the tunnel and retimbered it where the caves had occurred, laid a T rail track, put in a new bulkhead at the Fremont shaft and dug new water drains the entire length of the tunnel. They used the Burleigh drill worked by air compressor and had to run a pipe from the com-

pressor-room to the English trail drift, a distance of two miles. They carried 65 pounds pressure at the mill and had sufficient power at the mine to run three drills and the blacksmith forge, besides furnishing the necessary ventilation. After reaching the terminal point of the old drift, 1083 feet from the mouth, the tunnel was run 223 feet to the turntable, where it cuts the Josephine and Pine Tree. These two ledges come together about 60 feet north of this point. From the turntable above mentioned, this drift has been continued 400 feet south, making a total length of the main tunnel of 1706 feet, of which 623 feet has been cut by this company. At the turntable referred to a drift was started north on the Pine Tree ledge and continued until the ledges separated and diverged, when it was further continued upon the footwall of the Josephine, a distance of 250 feet. The mine has been prospected by 9 crosscuts. The first shoot of ore which was developed under the present management was discovered at the turntable, 1306 feet south of the mouth of the main tunnel. It has been drifted on a distance of 223 feet. This ledge is very large and strong, averaging from 8 to 34 feet in width. The value of this ore on the footwall is estimated at \$8 per ton. The balance of the ledge will go about \$4. From the openings of these two shoots of ore there have been 1300 tons extracted and piled on the dump and about 500 tons stored in the mine. Altogether after a thorough exploration of the premises and from some little experience and personal observation of quartz mining, the conclusion is reached that the company has a veritable bonanza uncovered, that the Pine Tree and Josephine mines were never in as good shape for working, and that the prospecting has been done with good judgment and shows on the part of Superintendent Cross a practical knowledge of mines and methods of mining.

Shasta.

GOLD.—*Shasta Courier*, May 24: The striking of a new gold mine a mile or two north of town by Cunningham, Drummond & Co., and the taking out of about \$1000 in pure gold in a few days and at a depth of not to exceed 13 feet, is pretty good. The surface prospect which resulted in finding this lead was found directly in an old trail over which thousands of feet have traveled in years past. The fact is people about Shasta don't know how much gold there may be within a few feet of them.

ACTIVITY.—*Redding Free Press*, May 24: Activity in mining is in order with the advent of warm weather, and we hear of several important deals about to be made. It is rumored that in the Old Diggings district a sale is about to be consummated that will bring in more capital and fresh vitality. The mines of this district are all looking up and the owners are sanguine of a prosperous year. The Hart & Fleming mine continues very rich at greater depth, and at present shows a rich body of ore. Only six miles from Redding, in this district especially, are our hopes concentrated.

ON SQUAW CREEK the mines are looking well. The Sierra Buttes M. Co. is engaged in running a long tunnel several thousand feet, by which they expect to strike the ledge and a large body of ore 1100 feet from the surface, which in Shasta county is quite deep. This company is wealthy and all its operations are on an extensive scale and calculated to develop its property in a systematic manner. The Carson & Snyder mine owners recently made a cleanup of \$6000 on a short run with their mill, which is very encouraging. Work on the Croesus and Clipper is being prosecuted, and we expect at any time to hear of these small companies being gobbled up by some large syndicate of capital, which is only necessary to develop bonanzas. The Riley & Bliss mine will again start up inside of a week.

ON KLEIN GULCH, in the French Gulch district, a big deal is on the tapis. The Gladstone has developed a wonderful wall of paying ore and is considered excellent mining property by experimental mining men. There are also other locations adjoining that promise well, and as we said before, a deal is in hand to secure several of these mines under one management. The Snyder mine, an interest in which was not long since sold for something like \$5000, is now held at \$15,000 and considered cheap at that figure.

BOWLERS.—The boulders of Castle creek, some 12 miles from Castle Crags, the place where Hufface has recently started a store, and expects to build a town, have been turned to some use. When the report was first circulated that these boulders, lying on the surface of the ground, prospected rich in gold, people here thought it was a huge joke, but from reliable sources we have found it to be a fact. The ground is covered with huge boulders containing gold, and rich ledges are no doubt close by. Considerable attention is being directed to this camp, which, it is thought, will shortly develop into one of importance.

POCKET MINES.—The past winter has been fruitful for pocket hunters and those searching for seam diggings. The district directly west from Redding has been rich in these kinds of spots, and at the present time several parties are making a good thing out of pockets and seams recently discovered. This district has in the past been unfortunate so far as well-defined ledges are concerned, and the numerous reports of rich strikes that have not materialized have destroyed confidence, but of late there seems to have been made a better showing. The Gem and Hartman mines show large bodies of ore with indications of depth, and maybe the district will become as popular as in the old days of placer mining.

Siskiyou.

KNOW-NOTHING CREEK.—*Cor. Trinity Journal*, May 24: We have experienced an extremely severe winter in this section, resulting in much damage to improvements necessary for the operation of the mines. On Know-Nothing Creek the damages are partially repaired. On our property, which sustained considerable damage, everything has been restored to complete running order, thus enabling us to work our mine to great advantage, and also to resume operations with our mill, which were suspended all winter and early spring from the results of deep snows, snowslides and landslides. We commenced running our mill on April 30th. I will make a few remarks on the mining outlook of the Salmon river in general. The indications for the ensuing season of quartz mining are very favorable, and a handsome output of bullion this coming season is quite assured. Among the more important mills in operation on the Salmon are the world-renowned Black Bear, owned by

Hon. John Dagget, and the Gold Ball Mining Co.'s mill. From authentic reports the outlook in the mines that furnish the ore for these mills is very promising. Hydraulic mining on the Salmon is a considerable industry, furnishing employment to quite a number of people. The output of bullion from these mines with an assured long season of water, supplied by the deep deposits of snow, is anticipated to be very handsome.

ORO FINO.—*Cor. Yreka Union*, May 24: Among other places of interest we visited Oro Fino, where we found the mining in full blast. The Eastlick Bros. giant was throwing water against the bank of earth. We also visited the famous Wright & Fletcher mine, and found Mr. Wright and his assistant, Dock, just in the act of putting their ponderous giant to work on a mound of earth that is destined to pay away up in the thousands, judging from a prospect that we were shown by the obliging proprietor. We were then conducted by Mr. Wright to his elevator, and it is wonderful to see its workings. Boulders, debris and other refuse is forced by the pressure of water through an inclined pipe 30 or 40 feet long, and makes its confluence into a tail-race, which carries all the deposit away. Without controversy, these mines are the best in Northern California.

Trinity.

CANYON CREEK QUARTZ.—*Journal*, May 24: W. J. Grigsby gave us the following items concerning the Canyon Creek quartz mine: The Buck's Ranch mine, owned by Grigsby & Shock, has a ledge 14 feet wide from wall to wall, and with extensions has been uncovered on the surface for about 4000 feet. The ore carries free gold and but little sulphurets and is good milling rock; 40 tons run through the arastra paid satisfactorily for the method of crushing. The heavy winter prevented much development work; a tunnel has been run in about 100 feet, and two men have been put to work on an incline; open cuts have opened up the ledge along the surface. They are now working on the extension and will begin crushing 30 tons of ore from it, which is higher grade rock than the main ledge. They crush the rock by means of an arastra put up last fall, which Mr. Grigsby designed and is a decided improvement on the ordinary arastra. It is self-discharging and has a working capacity of 6 to 7 tons a day; it has crushed 7½ tons in 24 hours. It is far better than a mill for all prospecting purposes. Mr. Grigsby has applied for a patent on his invention. From the amount of work done on the mine, it is estimated that at least 1000 tons of free-milling ore are in sight. Boyce & Eligh have four locations in this vicinity; one of the ledges runs parallel to the Buck's Ranch ledge. A little work in the shape of open cuts has been done and the ledges show up well. Dedrick & Carson have three locations near by which they are working; they have good prospects. The group of mines owned by Smith, Bailey & Flowers is about 1½ miles north and higher up the mountain. A good deal of work will be done on these mines this summer; the work already done has disclosed a fine property and it is confidently predicted that this group of mines will prove a veritable bonanza. The Canyon Creek mines are on the East Fork of Canyon creek, and are in a well-timbered country with water-power easily accessible, and can be worked cheaply. Mr. Grigsby is very sanguine of the future of the camp and confidently predicts large operations in the near future. The mines have made splendid showing for the brief period since their discovery, and if a good location for gold-bearing rock and the general formation of the country is any criterion, a few years will see Canyon Creek one of the best bullion-producing camps on the coast.

Tuolumne.

BLACK OAK.—*Tuolumne Independent*, May 24: If there has been any fault in the management of this mine, we do not know of the fact or as to its nature. The Black Oak mine, under the present and efficient management of Supt. Scott, we are informed, is in a better condition to-day than it has been for years. When Mr. Scott took hold of the property it was laboring under heavy indebtedness, presumed to have been incurred in its development; and now, after doing all that could possibly be done, Supt. Scott is beginning to realize the benefit of his time and trouble, and the future of the Black Oak mine is golden.

NEVADA.

Washoe District.

SIRRA NEVADA.—*Virginia Chronicle*, May 24: On the 631 level a southwest drift is advanced 651 feet from the shaft station. Formation clay and porphyry carrying water.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 414 feet and is in soft porphyry now showing some water.

MEXICAN.—On the 1465 level at a point 70 feet south from west crosscut No. 4, west crosscut No. 5 is advanced 45 feet in porphyry carrying quartz showing value.

OPHIR.—On the 1300 level in working southwesterly from the top of the raise carried up 28 feet above the south drift from the end of the east crosscut from the shaft station, following the ore streak found in the raise downward, 24 tons of ore were extracted and raised to the surface, the average assay value of which is \$25 per ton.

CON. CALIFORNIA & VIRGINIA.—The 1300 and 1500 levels continue to yield the usual quantity of ore. Shipped to the Morgan mill 1104 tons and 270 pounds of ore and to the Eureka 1313 tons and 1170 pounds; battery sample assays showing an average value of \$22.50 per ton; 2549 tons milled. Bullion valued at \$43,641.30 shipped to the Carson mint, and about \$13,000 on hand in local assay office.

NORTHWESTERN CON.—Continue sinking shaft below the 100 level.

ANDES.—A 420-level west crosscut, 160 feet north of the shaft, is in 30 feet, continuing in clay and quartz seams in the face. The 350 level west crosscut is extended 235 feet, the face still in porphyry.

SAVAGE.—Shipped 510 tons of ore, showing an average value of \$21 by battery sample assays.

HALE & NORCROSS.—Shipped 1120 tons of ore during the week, showing an average value of \$18.75 per ton by battery sample assays.

POTOSI.—On the 850 level east crosscut No. 4, 400 feet south of the north line, is in 130 feet, the face in porphyry. On the 930 level the winze is down 130 feet, the last 10 feet showing marked improve-

ment. The bottom is mostly in quartz giving fair assays. The raise above that level has connected with the 850 level, improving the circulation of air.

WARD COMBINATION SHAFT.—The 1800 level east drift is out 380 feet; the face continues in porphyry.

CHOLLAR.—Extracted 478 tons of ore, battery sample assays showing a value of \$23.83 per ton.

ALPHA.—The 600 level east crosscut is in 140 feet, the face in porphyry and quartz. The 600 level west crosscut is in 140 feet, the face in quartz.

EXCHEQUER.—The 500 level north line east crosscut is in 191 feet, and continues in quartz and porphyry.

CON. NEW YORK.—The 960 level north drift is out 225 feet, the face in low-grade quartz. The north drift from the top of the raise above the 800 level is out 22 feet, the face in low-grade quartz.

SILVER HILL.—The east drift from the winze below the 800 level is out 60 feet, the face showing bunches of fair-grade quartz.

SCORPION.—The southwest drift from the 630 level shaft station is advanced 591 feet and continues in porphyry.

IMPERIAL.—The 750 level west crosscut No. 3 is in 124 feet, the face in low-grade quartz.

YELLOW JACKET.—Shipped 540 tons of ore showing average assay value of \$21.50 by battery sample assays.

CROWN POINT.—Shipped during the week 855 tons of ore, showing an average value of \$20.52 per ton by p.p. assays. A west drift from the 400 level raise is out 41 feet.

CONFIDENCE AND CHALLENGE.—The joint Imperial 1000 level west crosscut No. 1 is in 240 feet, the face in vein matter and the bottom in ore. The joint Imperial raise above the 700 level north drift is in low-grade quartz. West crosscut No. 2, same level, is in 103 feet, the face in low-grade quartz.

BELCHER.—The 200 level west crosscut is in 23 feet, the face in low-grade quartz. The 300 level west crosscut is in 224 feet, the face in porphyry. The 850 level joint east crosscut is out 458 feet, the face still in soft porphyry. A 290 level west crosscut No. 3 is being advanced to cut the continuation of the Crown Point 300 level stop.

SEG. BELCHER.—The 800 level west crosscut is in 22 feet, the face in porphyry and quartz.

JUSTICE.—During the week crushed 216 tons of ore showing a value of \$22.50 per ton by battery sample assays. The raise above the 622 level is in low-grade quartz. The bottom of the winze below this level is in good ore.

ALTA.—The ore output this week was 325 tons, showing an average assay value of \$22.50 per ton by pulp assays.

OVERMAN.—Shipped 220 tons of ore during the week showing an average value of \$23 per ton by battery sample assays. The northwest drift continues in low-grade quartz.

UTAH.—On the 725 level, west drift is advanced 252 feet from the shaft. At a point 225 feet west of the shaft a south drift is advanced 37 feet, the face in vein porphyry with streaks of quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the slopes on the 400 and 450 levels. The 650 level main north drift is extended 96 feet through low-grade quartz.

NORTH OCCIDENTAL.—Work confined to repairs.

BEST & BELCHER.—On the 1000 level the joint west crosscut is cleaned out and repaired 300 feet. On the 1200 level the north drift is cleaned out and repaired 113 feet.

GOULD & CURRY.—On the 400 level the north-west drift from west crosscut No. 1 is extended 70 feet. Formation, hard porphyry with small streaks of quartz.

Dun Glen District.

BEING WORKED.—*Silver State*, May 24: The Hendra mill at Dun Glen is being worked to its full capacity. Sam Hendra has several men at work in the mine, which is producing high grade gold-bearing quartz, and the prospects of the camp are bright.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, May 24: Sixty cars of ore pulled out of the E. & P. railroad depot during the week. The Eureka Con. Mining Co. received during the same period from the mines of the district: From the Dunderberg mine, 55½ tons; the Helena Mortimer, 60 tons; Banner, 12 tons; Kentuck, 1½ tons, and from the Reveille district 4 tons.

A DEVELOPMENT.—We learn that Joe D. Jou has made a good development in his Whippoorwill mine. Assays of the ore go satisfactorily high. All of the evidences point to large bodies of ore in that section of Prospect mountain. The Whippoorwill adjoins the Diamond on the south.

Sylvania District.

PROGRESSING.—*Inyo Index*, May 24: Andy Fife, superintendent of the Sylvania Mining Co. at Sylvania City, arrived here last Saturday, and reports everything progressing finely. Boarding-house and furnace building are nearly completed. They have 500 tons of ore out and over 3000 tons in sight. All the men who were at work in the mine were taken out and put to work in building the works to get ready to start up. The machinery and water-jacket furnace are expected to arrive on Monday, and will be shipped to the mine immediately. There is a great deal of freight going out to Sylvania daily; all the teams in this section are busy and everything looks encouraging that Big Pine and Owens Valley are going to have quite a boom. The mines are in E. meralda county, Nevada, but all the Co.'s works will be put up in Inyo county, California.

Tuscarora District.

TO RESUME.—*Times-Review*, May 21: G. W. Grayson and P. C. Hymn left this forenoon by private conveyance for Carlin, en route for San Francisco. They stated before they left that active operations will be resumed at all of the mines under the directorship of which they are members, as soon as timbers and supplies can be obtained. It will probably be about a month before everything will be in full blast, after which time we shall be greatly disappointed if Tuscarora does not make such showing in the matter of bullion production as will rival that of any district of its size on the coast.

ARIZONA.

PEER.—*Alta*, May 26: The north drift from the bottom of shaft No. 2 has been advanced 5 feet, making 12½ feet in all, with face culminating in ore of good quality. The south drift from the bot-

tom of the same shaft is out 9 feet, with the vein strong and showing ore of good grade.

PEERLESS.—On the 340-foot level, winze No. 1 has been extended 15 feet, making 41 feet in all, without any change since last report, the vein showing strong and of fair grade.

CROCKER.—On the west side, tunnel No. 2 has been advanced 19 feet, making 189 feet in all. According to the survey, 60 feet more will connect with the 440-foot level, when further prospecting of ore at this point will be resumed.

WELDON.—In shaft No. 1 the formation is getting softer, and shows considerable iron and copper stains on the west side of the bottom. Better progress is being made.

NOTES.—Prescott *Courier*, May 23: Chamberlain & Charmickle have repaired the Lowell mill, Walker district, and are again running it as of yore in a profitable way. Robert Dougherty and Aleck Harris have come in from the Bradshaws and state that mills and mines are paying. Thirteen tons of silver ore, just shipped from the Blue Dick mine, Hassayampa district, sampled about \$250 a ton. The big gold mine between People's Valley and the Congress has just been bonded to three gentlemen—two Californians and a Coloradoan. One of the owners, Mr. Yarnell, has contracted to run a 200-foot tunnel. He will employ four miners. The vein is large, and gold to the amount of \$18 or \$20 a ton is scattered all through the rock. More teams, with concentrates from the Congress, reached Prescott yesterday. Mr. W. T. Rowe, who owns a big silver mine in Peck district, is here and says he has a great many tons of milling ore on the dump. P. A. Craigie will shortly ship rich ore from his Doris. Wm. Van Name is building another mill in Big Bug district, and a great many men are taking out ore. United Verde mines and smelters are sending out over a carload of matte, etc., each day. Another large shipment of high-grade silver ore was sent off last week by miners of Tip Top district. Quartz Mountain Co. are rearranging their mill and shipping some of their richest ore. Mr. O. F. Place of the Crowned King arrived yesterday from his paying camp. Arizona is indebted to him for the development of at least one good gold vein, which is now producing plenty of gold. Mr. Carlisle, superintendent of the Black Horse mine, is sending in ore which contains abundance of wire gold and native silver. More Congress sulphurets were hauled in yesterday. Mr. Henderson says times are good in Old Walker district.

COLORADO.

SILVER IN THE DEEP SHAFT.—*Aspen Times*, May 24: The Deep shaft that is being sunk by the Deep Mining and Drainage Co. upon the Home-stake claim has passed through the porphyry and is now in the shale. A rather peculiar development has taken place, in that native silver has been found in this shale, this being the first discovery of the kind that is recorded in this district. It is very common to meet with streaks of lead in this formation, but heretofore, silver, except in small quantities, has not been found in it. It is not at all probable that any value is attached to the discovery, but the fact that the silver appears in the native form is highly interesting and has created much comment.

THE LITTLE RULE.—Late reports from the Little Rule are to the effect that the recently discovered ore is still improving. The management expects to begin shipments from the property during the present week.

THE SCHILLER.—Several months ago the management of this property started an incline from a point 600 feet down the shaft, southeasterly, in order to cut the formation squarely and reach the contact with the least possible amount of work. The company operating the Schiller has been putting money into that ground for six years, and has at last obtained such great depth that it is not improbable that ore may be struck at any time.

THE BURRO.—Since the lessees of the Edison mine opened up the rich body of ore that lies along the line that separates that property from the Good Thunder, surveys have been made by the lessees of the Burro which show that it will be necessary to sink that shaft fully 60 feet deeper before the ore-chute can be reached.

DAKOTA.

A BIG TWELVE-HOUR RUN.—*Deadwood Pioneer*, May 24: Six thousand one hundred and thirty pounds of bullion, of silver and lead mixture, from the Iron Hill mill, were stacked up in front of the First National bank yesterday morning, and viewed by the hundreds of visitors who passed by. This represents a 12-hour run. As soon as a carload is turned out the bullion will be shipped to Omaha to be worked out.

FLOAT.—Bald and Elk mountains are putting on a scene of general activity. An attaché of the *Pioneer* made a hasty visit to their camps yesterday. Ore was being piled up on every dump; the busy notes of preparation were discernible everywhere. The old-timers who have held on to their properties for years will soon realize on their ores.

IDAHO.

GOLD UNDER THE CEMENT.—*World*, May 24: Kimball, Rudge & Sandlin, at the junction of Middle and North Boise, have struck rich placer ground underneath the false bedrock. The dirt yields from 25 to 50 cents to the pan. The sedimentary formation is only three or four feet thick; still the fact is proven that on those streams the first wash carried down the most gold. The theory of most of the miners here is that the richest ground in More and Elk creeks is below the sedimentary formation, having come in with the first wash. Whether or not such is the fact can only be proven by a shaft, which would have to be sunk to great depth. In 1870 one was sunk to the depth of 128 feet at the junction of the two creeks, but the water came in so rapidly that a 10-horse power engine was unable to keep it out, and the work was necessarily abandoned. To put down a shaft with certainty of proving whether the lower stratum of gravel is good it will be necessary to put in pumps capable of throwing a large volume of water. This will require considerable capital, yet it would be better to spend more money and be certain of reaching the granite bedrock. Some day this work will be done, and with

good chances of opening up rich placer ground. One favorable indication here is that where the granite dips under the cement, gold lays on it as far as has ever been prospected.

THE GOLDEN BELT. A prospect on Middle Fork of Henry creek, owned by Harry Friend and Gus Schlosser, is under course of development. Last fall the surface was uncovered for a few feet, and rich gold ore obtained, but, as the ledge from which it was taken was on low ground and filled with water, it was impossible to develop it by sinking, so a tunnel is driving for the vein which will tap it at a depth of 60 feet.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, May 23: The Princessa company is working 17 mines, employing, including tributaries, about 120 men. Their mill is kept busy night and day on first-class ore, and tons and tons of fair ore are on the dumps ready to be milled. The Telemaco is down 65 feet, the shaft being on a 75-degree incline. Hoisting works are just getting into place and a 50-horse power engine is on the ground. The Telemaco will average 3½ feet wide. Mr. Argall is foreman. Supt. Rodda believes the best mine of the Princessa company is the Ulysses, which is 600 meters long and 200 wide. Three distinct mines exist within this ground, besides the main vein. All are quite well developed, enough, at least, to prove them independent veins. They are from 1½ to 3 feet wide and very rich. The main vein is 3 feet wide. The Indian mine is now waiting for its big pump. It has hoisting works designed by Supt. Rodda which are the best here. The Princessa, under Foreman Hoskins, is going ahead steadily and is down over 100 feet. The Penelope is developing into a splendid property. Prospects of yellow ore containing oxide of lead from the bottom of the shaft went \$200 per ton. A large amount of ore containing sulphurets and pronounced rebellious was run through Lane's mill by Supt. Rodda and found to be free-milling \$200-ore. By concentrating the ore will run \$30. A strike was made in the San David by tributaries the other day and their claim was cheaply bought by the superintendent. Night and day shifts are at work on it. W. E. Howard, three-fourths owner of the Montezuma, was in camp the past week arranging to develop his mine. J. M. Albright is the other partner. The mine is right across the road from the San David and the strike in the latter points to favorable work on the Montezuma. Several Mexicans who have been at work as tributaries for the Princessa company run their ore through Lane's mill this week, netting 93 ounces. The brick was sent down on Monday's stage. The El Paso company made a cleanup last Sunday.

MONTANA.

THE BOULDER BASIN MINE.—*Anaconda Review*, May 22: All the mines in Boulder Basin are showing up in fine shape. H. W. Currin, on the Pilot, has a fortune in sight of high-grade carbonates ore. At the Mono, their new hoist is in position and two full shifts are pushing development. The Bismark and VonArmin are both yielding their usual amount of rich ore. George Spencer's new strike has almost two feet of solid high-grade galena in the bottom of the shaft.

NEW MEXICO.

DEVELOPMENTS.—*Silver City Enterprise*, May 24: C. M. Jay passed through the city this week with a car of high-grade ore for Socorro. Martin Cox and Geo. Dickinson are about to start work on the Silver Bar mine, at Bald mountain. They have some very rich silver ore in sight. Bell and Brown have made a test run on ore from the Tampico. The returns were quite satisfactory. The mill is being put in readiness for a long run. N. Bell has returned from Carlisle, where he purchased six Frue vanners, which will be added to the Bell & Stephens and the Smith & Ailman mills. The Aztec M. Co. is going to make a test of concentration of its low-grade ore by Frue vanners after amalgamation. The test run will be made at the Atlantic Gold Co.'s mill. Bell & Stephens have purchased a lot of machinery from the Carlisle M. Co., which will be placed in the Smith & Ailman mill at Pinos Altos. The mill will be started on ore from their claim on the Pacific vein as soon as the machinery is in place.

MOGOLLON.—The camp is still flourishing and new strikes are reported every day. New discoveries of rich ore chutes on the Queen lode are of frequent occurrence. Mader and Buhlman are taking out fine ore on the Denver location on the south side of Mineral creek. John Frye and C. Lyons have struck a little bonanza on the north side of Mineral creek. George Doyle and W. S. George have two very promising locations on the Queen lode on Copper creek. It is currently reported that Capt. Frank Vingo and Edward Phoenix will go to St. Louis within a few days to purchase a milling plant for the Little Fannie. The Confidence still holds its own; the working force on the mine has been increased. Frank Baxter is working the Ann Arbor and taking out very fine ore. Worden & Co. are working the California. They have sacked a small lot of high-grade ore and more is being taken out to make a shipment to the smelter.

UTAH.

THE GOVERNOR.—*Eureka Chief*, May 24: A reporter inspected the Governor mine, east of Dragon, Tuesday, in company with H. F. Gear and Jack Mogan. The shaft is down 77 feet, 30 of which is sunk in ore. They are now running a drift, and will soon commence stopping. The ore body grows larger as depth is attained, and there is no knowing how big it is or how far down it extends, but there is no doubt that there is an immense body of ore and every indication points to a big mine. They have over a car of ore on the dump and will begin shipping next week. The ore is rich, carrying heavy in copper, and some of it going as high as 50 ounces in gold. The Governor is owned by Judge Dana and Ben Bochman, and is leased and bonded to H. F. Gear, J. H. McChrystal, Hansie Oie and George Cline. They have set up an assay office and are running two shifts. There is no doubt that they have a bonanza.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 20, 1890.

- 428,159.—VEIL FASTENER—Adams & Tryon, S. F.
428,074.—GRASS RECEPTACLE FOR LAWN MOWERS—C. Buchmiller, Pasadena, Cal.
428,392.—HARROW—J. H. Hanson, Oakland, Cal.
428,251.—APPARATUS FOR REDUCING BITUMINOUS ROCK—J. B. Jardine, S. F.
428,174.—TELEPHONE—J. C. Ludwig, S. F.
428,117.—HORSESHOE—E. & T. Maloney, S. F.
428,283.—WAVE MOTOR—T. C. Naramore, Los Angeles, Cal.
428,177.—SOFA BED—Newhouse & Hansen, Modesto, Cal.
428,350.—WAGON JACK—Oliver & Wren, Oakland, Cal.
428,524.—HAMMER HANDLE—M. E. Reilly, Montezuma, Wash.
428,531.—SINGLETREE HOOK—A. Scott, Uniontown, Wash.

The following brief list by telegraph, for May 27, will appear more complete on receipt of mail advices:

California—Peter Abrahamson, S. F., window ventilator; Richard B. Avery and R. F. Smith, San Diego, hydrocarbon burner; Hans P. Christensen, assignor to himself and J. Hansen, Oakland, hydraulic motor; Frank A. Fox, S. F., car-coupling; Louis Glass and W. S. Arnold, assignors to R. W. Smith, S. F., two patents for coin actuating attachments for phonographs; George T. Hall, Monrovia, Cal.; Frank J. Johnson, Sacramento, Cal.; Joseph P. Kelly, S. F., railway rail joint; Stephen Wren, Sacramento, spike-making mechanism; Edward W. Williams, S. F., overflow sloop-hopper; Sterling P. and E. Windsor, Madison, spreader for draft chains.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TELEPHONE.—John C. Ludwig, S. F., assignor of one-half to A. C. Pansell and Martin Corcoran of S. F., and T. C. O'Conan and H. T. Compton of Oakland. No. 428,174. Dated May 20, 1890. This is one of that class of telephones in which a diaphragm operates against the armature of a magnet to induce a current over the line-wire; and it consists essentially in a hollow sounding-frame or box to which a mouth-piece is attached, the back of said frame or box forming the diaphragm, which acts upon the armature of the magnet. The invention further consists in the combination, with a suitable diaphragm, of a particular arrangement of armature and magnet; and it consists also in the novel arrangement and combination of the hollow frame forming a sounding-box with a mouth-piece in its front, the back wall serving as a diaphragm, the magnet, the bobbin thereof, the armature of the magnet, and the arm of the armature resting against the back wall of the sounding-box. The object of the invention is to materially increase the efficiency of the telephone by increasing the loudness and distinctness of the sound transmitted.

APPARATUS FOR REDUCING BITUMINOUS ROCK.—Joseph B. Jardine, S. F. No. 428,251. Dated May 20, 1890. This invention relates to that class of devices for melting or softening bituminous rock, asphalt and other substances used for paving, roofing, etc., in which the material is confined in a kettle and is reduced by the action of steam. The patent covers a number of novel details of arrangement and construction of the kettle, making it simple and effective.

VEIL FASTENER.—Herbert W. Adams and Philo N. Tryon, S. F. No. 428,159. Dated May 20, 1890. This is a device for fastening and holding ladies' veils in place. It consists of two separate pieces formed of wire, and comprising parallel elastic wires for holding the ends of the veil and the enlarged openings for the introduction of the ends of the veil between said elastic wires, one of the pieces having a loop or eye and the other a hook for engagement therewith, this hook having a corrugated shank.

SOFA BED.—Ossey Newhouse, Modesto, and Lewis Hansen, Newman, Stanislaus Co. No. 428,177. Dated May 20, 1890. This invention relates to that class of furniture known as sofa-beds; and it consists in the novel improvement in the arm-rests of the sofa, whereby they are adapted to be converted readily into the head-board and foot-board of the bed, and the novel improvement in the means for enporting the back of the sofa when in an approximately upright position and also when in a horizontal position, forming part of the bed. The object of the invention is to provide a sofa-bed in which the entire length of the bed may be utilized without interference from the arm-rests or the head and foot boards, and in which the means for enporting the back or folding portion are simple and effective.

YOU BET.—The once almost depopulated town between here and German Level is daily improving, and it is now quite a lively camp. New families have been moving in, and business is good there. The prosperity is principally due to the working of the Brown mine by drift process.—*Nevada County Herald*.

Mining Share Market.

The mining share market continued active in the Comstock throughout the past week, with Potosi the leader, followed toward the close by an upward move in Bullion. The move in the latter is not in sympathy with Potosi, but it is based on work heretofore mentioned by us that is being done in Bullion ground. The rest of the market did not do much, for while Potosi and Bullion stocks moved up nearly 40 per cent since last Thursday, the other stocks advanced on an average only about 10 per cent. The manipulation has been of such a character as to clean commission brokers out of nearly all stocks held by their customers. The buying of so many stocks by the ring or pool necessarily means ore talk later on so as to sell out at higher prices, to collect assessments and make a few hundred thousand dollars for summer use. Not but that there is merit in the mines, and that under proper management they can be made to pay dividends, but to the ring there is more money in assessments, a three or four dollar stock deal and the milling of ore so as to get the bullion or huddle, than there is in dividends.

In outside stocks the Tuscaroras were more active, with North Commonwealth, Del Monte and one or two other stocks selling higher, while Commonwealth held heavy. In the Bodies there was nothing done. In the Quijotas business was light, with only few transactions in Crocker, Central, Peer and Peerless.

In the Alta group there has been and still is steady concentrating buying by a pool. The buying is based on important work going on in the mines.

From the mines, our Virginia City advices report continued improvement in Overman as prospecting work is pushed. A northwest drift has been started on the 300-foot level which promises well. It is being run toward Seg. Belcher. In Belcher, active prospecting work is under way on several levels, with three of the drifts or crosscuts in very interesting ground—some say in ore. Crown Point ought to do better now that the mill is not crushing ore, owing to high water, for more prospecting work can be done. The drift heretofore mentioned by us that is being run from the 850-foot level Ward shaft into Bullion to tap the ore found in Potosi, is being vigorously pushed. The crosscuts in Alpha and Con. Imperial are being pushed ahead. The west crosscut in Confidence is officially reported to be in vein material, while private advices report ore. The west crosscut in Challenge is being pushed ahead to tap the west ledge found in Confidence, Alpha and Con. Imperial. Interesting work is being done in Gould and Curry, Best and Belcher and two more of the North End mines. In Kentucky the hoisting winze has been connected with the 1000-foot level.

High water in the Carson river has caused the stoppage of the mill running on Crown Point ore and one of the mills running on Con. Virginia.

Over a year ago the MINING AND SCIENTIFIC PRESS took strong grounds that there was a well-defined mostly gold-bearing lode lying to the west of the Comstock lode, and now our position is being proven correct, as has every assertion we have made about ore developments been verified later on by official reports. W. E. Sharon and other mining men now affirm that the west crosscut run show that the body of ore run into on the 750-foot level in Confidence and Challenge dips to the west, and on the 1000-foot level the body of ore run into in the Confidence ground has the same dip. Experienced practical mining men unhesitatingly state that the present finds in the Gold Hill mines warrant the assertion that under proper management no more assessments need be levied by the Gold Hill mines, but in lieu thereof dividends be paid. The ore goes, so it is reported, from 65 to 80 per cent gold, and averages across the face of the lode from \$40 to \$60 a ton—some claim higher assays.

In Potosi it is said they intend to commence stopping out ore soon. Whether this means an assessment, like Hale and Norcross, later on, remains to be seen.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

GIANT FUEL MANUFACTURING CO., May 23. Capital stock, \$500,000. Directors—Frank Loftus, Chas. S. Preble, John H. Durst, James Madison and Frederick Eldridge.

GOLDEN WEST BUILDING AND LOAN ASS'N., May 23. Capital stock, \$3,000,000. Directors—S. W. Levy, Jacob Bicon, I. W. Goldman, Henry Jacobs, A. Willis Lighthouse, H. I. Barron, Gustave Brenner, Solomon Getz and Samuel Lewis.

CAPITAL BUILDING AND LOAN ASS'N. Capital stock, \$3,000,000. Directors—L. R. Ellert, F. Mandelbaum, Joseph Fiegel, Nathaniel Hunter, H. Shainwald, S. C. Buckbee, James K. Kennedy, F. C. Richards and Leon Greenberg.

PETALUMA FRUIT-PACKING CO., May 23. Capital stock, \$100,000. Directors—F. C. De Long, John Allen, Wm. Hill, A. B. Field and B. F. Stone.

WELLMAN, PECK & CO., May 24. Object, to conduct a wholesale grocery business. Capital stock, \$500,000. Directors—R. A. Wellman, A. K. Wellman, W. B. Wellman, W. J. Tilley, Frank Harold, William P. Harold and George R. Savage.

ZENGER WOOD RETORT AND MANUFACTURING CO., May 24. Capital stock, \$7,000,000. Directors—A. Zenger, H. E. Frost, J. B. Warren, M. J. Henley and John S. Kimball.

COSMO METAL CO., May 27. Object, to make, manufacture and vend composite metals, and to buy and sell all kinds of metals. Directors—C. A. Luckhardt, H. E. Trubenbach, S. E. Tucker, D. Crullins and Adolph Osterich.

Bullion Shipments.

We quote shipments since our last and shall be pleased to receive further reports:

Eureka Cons., May 25, \$27,000; Cons. California and Virginia, 22, \$13,106; total on May account, \$69,588. From Butte, Montana, week ending May 17, \$87,520; Hanauer, 23, \$3925; Salt Lake City, week ending May 22, \$194,250; Comstock mines, week ending May 24, \$116,276.

MECHANICAL PROGRESS.

Mechanical Improvements.

There seems to be, just at this time, quite a multiplicity of valuable inventions about coming into use. One of the holdest and most important is that for reducing iron and steel into practical forms for use direct from the furnace or converter.

Steel Tubes Directly from Molten Metal. The bold proposition of a Boston inventor, is about to be put into commercial shape in the city named. No details are given other than that experimental machines built have demonstrated the feasibility of rolling a tube directly from molten steel, iron, brass or other metal. The inventor also claims that he can make compound tubes in the same way by rolling one metal on another. There is a big fortune in the scheme if the thing can be done.

Seamless Steel Boats.

Metallic articles of small compass for household purposes, etc., have long been made by direct pressure and without seams. An English inventor, however, has greatly enlarged the sphere of this industry by devising a method whereby it may be applied to much larger articles than heretofore. Mr. William Heslop, formerly of the Leeds Forge, England, is applying hydraulic power to the manufacture of steel boats. This has been attempted before, but unsuccessfully. What is known by engineers as the "buckling" of the plate—that is, the crimping along the edge of the metal—produced in the flanging operation, was the great obstacle to be overcome. Mr. Heslop commenced experimenting in cold lead, and he found that to get rid of the "buckle" in one operation was an impossibility; but careful experiments proved that the difficulty was to be overcome by degrees—that is to say, by doing a certain portion of the flanging at first, then an additional portion by a second operation, and the remainder by a third. The advantages claimed for the invention are various. These seamless steel boats will be proof against the destructive influence of sun and shower, and be much more durable and reliable than wooden boats. Though made of steel, the weight will not be greater than that of a wooden boat of the same size, and the buoyancy will not consequently be less. The corrosion of steel, which can be prevented by painting, will not be a greater drawback than it is in the case of torpedo or other vessels made of the same material. It is contended that, in every respect, the seamless steel boat will be superior to the wooden one, and the cost of the one, it is stated, will not be materially greater than the other.

Copper Articles Directly from the Rough Metal.

It is now considered quite certain that the method recently patented by an Englishman of manufacturing copper articles direct from rough copper here, will achieve results for that metal equal in importance to what Bessemer's process has done for iron and steel. Briefly, copper is electrically deposited from the rough bars upon a revolving mandrel or mold, over the face of which a burnisher moves automatically, and so condenses the copper particles as they are deposited, the material being thus rendered not only dense, silky, fibrous and cohesive, but possessing an otherwise unobtainable strength, ductility and uniformity at a low cost. Among the advantages enumerated for the process is the important one that, in the manufacture of tubes and similar articles, all drawing down and brazing is entirely dispensed with. There is practically no limit to the diameter of seamless pipes and other articles that can be produced, which has not been the case heretofore. Many copper products, especially large tubes, vats, cylinders, and the like, can be made direct from rough copper far cheaper than by any other process. The electrical conductivity of the annealed copper is greater by four and a half per cent than that of the best commercial copper; and the copper can be varied in tensile strength and ductility according to the requirements. With all these points in its favor, it is also stated that the quality is first-class and the cost much reduced from that of the ordinary method.

Half a Century of Inventions.

Those of us not yet fifty years of age have probably lived in the most important and intellectually progressive period of human history. Within this half-century the following inventions and discoveries have either been placed before the world or elaborated: Ocean steamships, railways, street tramways, telegraph lines, ocean cables, telephone, phonograph; photography and a score of new methods of picture-making; aniline colors, kerosene oil, electric lights, steam fire engines, chemical fire-extinguishers; anesthetics and painless surgery; gun-cotton, nitro glycerine, dynamite and a host of other explosives; aluminum, magnesium, and other new metals; electro-plating, spectrum analysis and the spectroscope; audiophone, pneumatic tubes, electric motors, electric railways, electric bells, type-writers, cheap postal system, steam-heating, steam and hydraulic elevators, vestibule cars, cantilever bridges. These are only a few out of a multitude. All positive knowledge of the physical constitution of planetary and stellar worlds has also been attained within this period.

Iron in the Coming Census.

One of the most interesting features of the industrial department of the eleventh census, says the *Philadelphia Record*, will be the enumeration of the iron and steel making establishments of the country. Taking the nation as a whole, the iron and steel industries will probably show the most important advances that have been made in any American industry during the last decade.

The great strides that the iron and steel industries have taken since the last census have been not only in increased production but also in the introduction of new elements of industry, improved processes, and the amazing development of new producing territory.

The statistics of the iron and steel industries of the entire country are being gathered, under the direction of Dr. Wm. M. Sweet, who is establishing his headquarters at 261 South Fourth street, Philadelphia.

The iron and steel department of the division of manufactures embraces blast furnaces, rolling-mills and steel works—iron ore being a distinct branch of the division of mining. In laying out his work, Dr. Sweet has prepared schedules for each different branch of the iron and steel industries, grouping them in this manner: Blast furnaces, rolling-mills, Bessemer and open-hearth plants, crucible steel plants, and forges and bloomeries. In addition to separate schedules for each of these, there are several forms for preliminary information. The points covered by these schedules embrace all the details of production, such as character and cost of material and labor, and are calculated to bring out all the essential features of the business.

When all these returns shall have been received, analyzed and classified, they will show some very interesting information. One of the most significant features will be the position of the Southern States among the pig-iron producers. While the progress of the South has been known in a general way, the forthcoming census will set forth the facts in a more definite and detailed form. Alabama and Tennessee, which ranked tenth and thirteenth respectively among the pig-iron-producing States in the tenth census, will be shown in about the fourth and fifth places; while Pennsylvania and Ohio will still hold their relative rank as first and second. The total production of pig iron, as given in the last census at 3,781,021 net tons, will appear at more than double that amount. The American Iron and Steel Association's report for 1889, which will come very near the census figures, showed 8,517,068 net tons. The steel-rail output will show an increase of similar proportions.

Among other things that this branch of the census will show will be the remarkable extent to which steel has been substituted for iron during the past decade. This has resulted from improvement in the methods of steel-making and the consequent reduction in the cost of product. One point that will be brought out by the census which is not generally known, and which did not appear in the tenth census, is the existence of extensive facilities for the manufacture of heavy armor plates and for making heavy gun forgings.

Ten years ago this country was practically without such facilities, but now there are establishments in the United States that exceed any in the world in their capacity for steel forgings and heavy armor plates. Since the tenth census two new processes of making Bessemer steel have been introduced, and are now in use in this country. These are the Clapp-Griffiths and the Robert-Bessemer processes, both of which are modifications of the ordinary Bessemer processes. They are both of comparatively recent origin, and their use has not been extensive as yet. The basic process of making steel, which is largely in use in Germany, is just securing a foothold in this country, but its introduction has been retarded by the extended litigation over the patent rights.

CHEAP PLAN FOR MAKING CAR WHEELS.—The *Railroad Gazette*, in an account of the shops of the Northern Railroad of France, says they have a very economical plan of making wheels for cars by bending up seven pieces of bar iron in such a shape that the center fits inside of a band or false fellow, which, in turn, is hammered into a groove in the tire. Fellow and bar are riveted together and the bars bent round to the center of the wheel, and their ends then have a mold placed below and above them; cast iron is then run in, forming the hub, which is afterward bored out and the cast-steel axle forced in by 55,000 to 66,000 pounds hydraulic pressure. The life of the center of the wheel is said to be practically interminable under ordinary conditions, and the cheapness is such that they are now adopted almost entirely. However, in some cases wrought bands will be seen to have been shrunk on the hubs of some that have been cracked by wreck or other cause; but the greatest care is taken to reject any with end cracks or other defects.

SUBSTITUTION OF IRON AND STEEL FOR WOOD. Iron and steel are constantly coming more and more into use as a substitute for wood. This perhaps is more noticeable in France and England than it is in this country. Iron and steel are used, wherever practicable, in manufactured articles, such, for instance, as building materials, boxes and packing cases, barrels and casks, carriages, carts and other vehicles, furniture, fencing, railway work, sheds, signal-boxes, telegraph poles, etc.

SCIENTIFIC PROGRESS.

Instinct vs. Skill.

Mechanical skill does not seem to be altogether confined to the human family of animals. Many of the lower order of animals seem to possess quite as high a degree of mechanical skill as man. We call it instinct in the lower orders because it seems to be inborn with them; while in man it is an acquired knowledge and reached only by progressive degrees. The animal and the insect perform their first mechanical work without either model or instruction, and their first is as perfect as their last. They have no "accidents" in their communities. The relation between human reason and animal instinct is so nearly allied that the line of demarcation cannot be readily pointed out.

Who does not admire the skill of the bee in constructing her cells for honey?—nothing could be more mathematically correct. The same thing may be said of many other insects—especially of the various spiders, who provide beautifully delicate and safe homes for their families. The beaver also builds his dam and constructs his house with a wonderful degree of what we are constrained to call intelligence. Its mechanical principles are perfect. He could not build as he does without a cutting tool and trowel. His teeth provide the one and his tail the other. The nests of many varieties of birds display much apparent ingenuity and forethought in so constructing them as to guard their progeny from danger of various kinds. Many other similar references might be made.

We have in California what perhaps may be considered the chief of animal architects in the shape of a spider. His form and habits are anything but pleasant to consider, but his architectural skill is wonderful to contemplate. In the construction of his home he may well challenge the world, whether insect or animal. Being confined to tropical and semi-tropical regions, he must provide a retreat impervious to water. This he does by the use of a cement that becomes so firm and hard that water will not penetrate its walls. The cover to his little tenement is one of the marvels of instinct which approaches so near to reason that we can't appreciate the difference. It is a trap-door and on the top of his house. The opening must first be made and the door must be made to fit it. No casketmaker ever constructed a more nicely and closely fitting door, either large or small. It neither shrinks nor swells; it opens as easily as though it simply rested upon a plain surface. It has a hinge so constructed that it has no play, except in the proper direction for opening and closing. As we have remarked, the opening must have been first made, and with a smooth, beveled edge. The door must be made in a separate piece and is usually about half an inch in diameter, perfectly round, beveled in the opposite way from the opening, and about a sixteenth of an inch in thickness. This door must be made away from the opening which it is designed to close. How does the little mechanic contrive to make so perfect a fit? Does he rely solely upon his eye for the proper dimensions, or does he lift it up and put it in place, repeating that operation and moving it off again until he gets the exact fit? And then how does he fasten to the opposite walls that wonderful hinge, which never creaks, so elastic and yet so true in its motions? If the insect was a human, he would patent the device, and make his co-associates pay him tribute; but not so in spider commonwealth—everything there is common, in reality.

Did any one ever see this insect mechanic at his work? We imagine not; else we should have been told long since just how he wrought. He is a very shy being. If not attacked, and most likely would go off on a strike if he saw any one watching him. The *modus operandi* of this spider at his work would be a very interesting study. Who will take the time to investigate and report upon this unique species of architecture?

Astronomical Progress.

During the past two years there has been much valuable progress made in astronomical science, especially in the line of photographing certain nebulae and other star clusters. Photography has also brought to light many very faint (gaseous) nebulae which the telescope fails to detect. The moon's surface has also been photographed, and its minutest details brought out with a distinctness hitherto unknown.

The 1474 photographs of the transit of Venus for 1882, taken by the American astronomers at Washington and elsewhere, have been reduced, and the solar parallax resulting therefrom is 82 in. 347, which corresponds to a mean distance of the earth from the sun of 92,335,000 miles, with a probable error of only 125,000 miles. These numbers are no doubt close approximations to the truth, but they cannot be regarded as final until all the observations made by astronomers in other countries are reduced and discussed.

Six new asteroids have been discovered within a year. They are all exceedingly small bodies for primary planets, and are situated in that immense region between Mars and Jupiter.

A very valuable discovery of great practical importance in the manufacture of astronomical telescopes has been made by two distinguished German physicists, Prof. Abbe and Dr. Schott,

of Jena, Germany. The great defect in all large telescopes of the refracting kind is the secondary spectrum, due to the fact that the lenses composing the object-glass do not focus all the refracted rays at the same point. By using different kinds of glass, opticians have succeeded in bringing together two widely differing rays of light, the red and the blue, but have not succeeded in bringing together all the other intermediate rays, so as to form a colorless image, owing to what is called "the irrationality of dispersion." It is also claimed by the discoverers that the fool for visual and for photographic purposes are identical. All the telescopes hitherto made of the new glass have proved quite satisfactory in these respects.

The recent observations in regard to the mechanical character of the corona, if further observations should prove its correctness, will solve a most puzzling question and form a most important step in astronomical progress—one which will redound greatly to the reputation of the Lick Observatory, from whence the theory and preliminary observations were first announced.

THE HEAT EVOLVED BY ANIMALS.—Prof. Rosenthal of the Berlin Physiological Society has been experimenting on the heat given off by animals. According to *Nature*, he placed the animal to be experimented upon in a copper vessel that could be easily ventilated, and surrounded this vessel by a reservoir containing air, whose expansion or contraction was to give the means of determining the heat given off by the animal within. Although the dog used in the experiments was fed in exactly the same way at each meal, the quantities of heat produced varied very largely, and no considerable uniformity could be had without taking the mean of a long series of observations. Up to about the third hour after the meal the heat-production diminishes. It then rises rapidly and attains a maximum, after which, at about the eighth hour, it begins to fall again, irregularly, until the next meal. When an excess of food was given, the heat produced was always less than that calculated from the oxidation of the food; but with a uniformly constant diet, the mean value of the heat produced corresponded to the amount calculated. When the surrounding air varied in temperature between 41° and 77° F., all other conditions remaining the same, a minimum production of heat was observed at 59° F. From this point it increased uniformly in both directions—not only when the temperature fell to 41°, but also when it rose to 77°. The amount of carbonic acid gas given off by the animal agreed with the theoretical amount when the experiments were continued over a considerable length of time.

THE CHINESE LANGUAGE.—The impression generally prevails that the characters used to express thoughts and sounds in the Chinese language are necessarily multitudinous in form and character; but the fact is that when reduced, as it might be, to its minimum of characters, it is more simple than any language extant. There seems to be a long and short form of expressing sounds on paper. We see it stated that Rev. W. H. Murray, a missionary at Peking, has devised a system for teaching the blind, and has reduced the Chinese language to 408 syllables. By this system the blind have been enabled to learn to read with marvelous facility. So simple is the system thus inaugurated that the printing of books is produced at an amazingly low rate compared with books embossed for the blind in this country. Among the Chinese the blind are regarded with great consideration. The writer was informed many years ago by Dr. McGowan, a well-known Chinese missionary, and a person well acquainted with the Chinese language, that Chinese characters might be reduced to less than half the characters employed in the English language, and that when so reduced it would be the easiest language for use in telegraphing, of any in the world. The work of Mr. Murray in that direction seems to confirm the opinion of Dr. McGowan.

ANOTHER ALLEGED SUGAR PROCESS, by electricity, is announced. A correspondent of the *Louisiana State Planter*, of New Orleans, sends a letter from Havana, Cuba, in which occurs this notable paragraph: "You will receive by mail a small parcel containing some of the sugar said to have been manufactured at this place by the electric process invented by Messrs. Maigrot and Sobeslee, and of which all the Havana papers spoke some time ago. Said sugar is said to polarize 100°, and the inventors of the process affirm that sugar of the same kind can be obtained with their process from all sorts of juices of certain saccharine richness."

PLANT DYNAMICS.—The great force exerted by growing plants may be demonstrated by direct measurement. By an arrangement of harness and levers, President Clark of Amherst Agricultural College, made a growing squash register a pressure equal to thousands of pounds, when finally the harness broke. A tree in a graveyard at Hanover, Germany, has lifted more than five inches a block of stone containing 20 cubic feet.

UNIFORM TIME.—Germany has adopted a uniform standard of time for the whole empire. The fifteenth degree of longitude east of Greenwich is near the center of the empire, and when the sun is immediately over this meridian it is declared to be noon for the whole country.

GOOD HEALTH.

How to Live Long.

It is the opinion of Dr. Lewis A. Sayre, the famous surgeon, that everybody, under ordinary circumstances, should live to be one hundred years old. We live now on an average of from eight to fifteen years longer than our forefathers, but still we die prematurely. In his judgment it is possible for most of us to be centenarians, without neglecting the ordinary duties of life, if we observe certain laws of health. In an interview lately he makes many useful suggestions, which, if complied with, would tend to lengthen the average of life considerably. He says that the majority of people eat more than they ought, and too fast. In eating it is not a question of how much a person can devour, but how much he can digest. Water should be drunk at its natural temperature. Ice water, which people generally gulp down in unlimited quantities, paralyzes the nerves of the stomach, and is one of the greatest causes of dyspepsia in this country. Boiling water, drunk an hour or so before meal, is a valuable aid to digestion in many cases. Whisky is useful at times, like castor-oil, but it is not beneficial when used as a beverage.

Tobacco is decidedly injurious when used to excess. A mild cigar, smoked after dinner, however, has a soothing effect, and the smoker sustains less injury from it than he would from rushing off to work on a full stomach.

The average person ought to have eight hours' sleep. Some people who work at night and sleep in the daytime live to a good old age, but people who work during the day and sleep during the night are better off.

Open grates are far preferable to any other means of heating a house, for they help ventilation, which is an important factor in the prolongation of life.

The American people have too much to do, too much to think about, and too much care to bear. Many are very much distressed, as younger men, to know how they are going to make ends of a living. By and by, when their reputation has grown, they are driven to death with the work forced upon them.

Love of Life.

Phrenologists have assigned to a protuberance under the ear the faculty of "vitaliveness," or love of life, and some of them assume that in proportion to the size of the hump is the strength of the vital element in the individual.

However this may be, that the love of life is intense in some minds, and scarcely exists at all in others, nobody, of course, will deny; and it is no less true that persons who earnestly desire to live can keep a mortal disease at bay much longer than those who are comparatively indifferent to their fate.

The tenacity with which some men cling to life is marvelous. We had an instance of this in the case of a noted pugilist, several years ago, who was shot in the breast during a bar-room scuffle, and his condition was pronounced hopeless by the surgeons. But he scoffed at their opinions, and actually lived several days with a ball in his heart; keeping his hold upon life—so it seemed—by sheer force of will.

A resolute determination not to succumb is, as every army surgeon knows, the salvation of many a wounded soldier, who without it would assuredly die. In the Crimean war the mortality among the wounded Turks was much greater than among the wounded French and English. The latter wrestled stoutly with Death and often baffled him when their doom seemed inevitable; but the predestinarian Muselman, when dangerously injured, said gloomily, "It is my kismet" (fate), turned his face toward Mecca, and gave up the ghost.

There can be no doubt that love of life and vigor of will have been the means of restoring to health thousands of patients who but for these mental characteristics must have perished.—*New York Ledger*.

COLDS CAUGHT AT FUNERALS—Severe and fatal colds are often taken at funerals; but a new and very proper innovation has recently been made in several localities to prevent such occurrences. This consists of the use of silk skull caps, to be worn by the minister in charge and the hearers at the grave, also by the male members of the family and other attendants. The caps are put on in the carriage and the ordinary hats left there, the caps to be worn all the time at the grave. It will prevent many colds.

HOW TO TREAT A SNAKE BITE—A young man was bitten on his thumb by a rattlesnake, a few days since, near Stockton. The lad instantly cut through the wound with his knife and vigorously sucked out the poisoned blood. His prompt treatment saved his life, although he suffered severe pains from the wound for several days. It is quite generally known that such treatment will usually save life; but there are few who have the courage or thought to try it.

A DOCTOR who discourages nostrums tells his patients to take plenty of buttermilk and get plenty of sleep instead of a spring medicine.

USEFUL INFORMATION.

HOW BASE BALLS ARE MADE.—Automatic machines for making base-balls have been so successfully contrived that their introduction is likely to constitute an important practical industry. Each machine winds two balls at one time, according to the following movement: A little para-rubber ball, weighing three-quarters of an ounce, around which one turn has been made with an end of a skein of old-fashioned gray stocking yarn, is slipped into the machine, then another, after which the boy in charge touches a lever, the machine starts, and the winding begins, the rubber ball being thus hidden in a few seconds, in its place appearing a little gray yarn ball that rapidly grows larger and larger; when it appears to be about half the size of a regulation baseball there is a click, the machine stops, the yarn is cut, and the boy picks out the ball and tosses it into the basket. When this basket is full, it is passed along to another boy, who runs a similar machine, where a half-ounce layer of worsted yarn is put on. The next machine adds a layer of strong white cotton thread, a coating of rubber cement is next applied, and a half-ounce layer of the very best fine worsted completes the ball with the exception of the cover.

AN ALUMINUM FIRE ESCAPE—A new use has been found for the peculiar qualities of aluminum, by a Mr. J. Athey of Marion, Arkansas. The aluminum is rolled into a thin tape, capable of sustaining a weight of 1000 pounds. This tape is wound upon a small roll provided with a clutch. Mr. Athey recently gave an exhibition of his invention by letting himself down from the Marion suspension bridge nearly to the river below, a distance of 192 feet. One end of this tape was fastened firmly to the bridge, near the center. The man grasped the reel about which the other end was wound, and by means of a clutch was able to lower himself or stop at will. When he reached a point a short distance from the water, he hung until his photograph had been taken. The advantage of the aluminum over rope is the small compass into which it can be arranged, its light weight and great pliability.

FIRE AND WATER FROM THE SAME WELL.—Some gas-well borers in Marion, Ind., struck a stream of water at a depth of 250 feet. The water was oiled off and the well sunk 900 feet, when a powerful flow of gas was struck, the pressure of which lifted the casing and let in the water, producing a veritable geyser. A day or two afterward, a man named Jackson came to the derrick and struck a match to light his pipe. An explosion followed; the workmen were blown through the derrick, and Jackson narrowly escaped being roasted alive. The derrick was burned down. The strange spectacle is witnessed of a resistless volume of fire and water issuing from the same pipe. The column is shot to a height of 100 feet and escapes with a roar that is appalling. All efforts to restrain the well or even put out the fire have since proved futile.

LIQUID GLUE possesses great resisting power. It is particularly recommended for joining wood to metals; is prepared according to Heetz, as follows: Clear gelatine, 100 parts; cabinet-makers' glue, 100 parts; alcohol, 25 parts; alum, 2 parts; the whole mixed with 200 parts of 20 per cent acetic acid and heated on a water-bath for six hours. An ordinary liquid glue, also well adapted for wood and iron, is made by boiling together for several hours 100 parts glue, 260 parts water and 16 parts of nitric acid.

FLORIDA SHELL MOUNDS—It is said that no part of the United States contains so many remains of a former race as Florida, as shown in both the number and size of her mounds, some of which consist chiefly of shells and others mostly of sand. The shells in some of the mounds partake largely of the general characteristics of pliocene fossils, indicating that the mounds are of a very great age. The scroll-work on some of the larger shells and upon pottery indicates a Greek origin.

HOW THE GERMAN RUBBER PAVEMENT IS MADE.—A German paper says: The rubber pavement invented by Basson-Hannover consists of 85 per cent of ground stone and 15 per cent of a rubber mass, which, after a special treatment, is mixed with the stone powder. This pavement material is entirely even, and, when applied to the street on top of a layer of concrete, looks like asphalt, although not as smooth as this; it produces no dust, and is noiseless.

EMPLOYEES IN THE COAL INDUSTRY—The number of employees in this industry in the several States is 337,700, of which number Pennsylvania employs 208,000—91,000 of whom are engaged in the anthracite mines. The next largest employer is Illinois with 30,000; then comes Ohio with 25,000, and Iowa with 12,000. No State or Territory on the Pacific Coast is included in the enumeration.

BELOIAN FARMERS have become alarmed at the way in which the frogs are being exterminated by French pot-hunters, and have petitioned the King to forbid killing frogs during certain months of the year, as is done with

other game. The farmers regard the frogs as valuable slug and insect destroyers.

A MESSAGE was telegraphed from Mount Reno, near Fort McDowell, to Mount Graham, near Fort Grant, A. T., by the heliograph, 125 miles, in a single flash, and sent to Fort Huachuca, 90 miles, making 215 miles with a single intervening station. This was done last Friday. The longest distance heretofore has been 70 miles.

POLAR EXPLOSIONS IN ENGLAND.—Last year 53 boiler explosions occurred in the United Kingdom of Great Britain, resulting in the death of 25 persons and the injury of 53 others. Other accidents in connection with boilers caused death to 7 persons and injuries to 12 people.

ENGINEERING NOTES.

The Niagara Falls Canal.

The ship canal around Niagara Falls has been favorably reported upon by the Congressional House Committee on Railways and Canals. The bill provides for a ship canal built by the United States around Niagara Falls. The definite location is to be made by a board of five men appointed by the President, two of them to be army engineers, two civil engineers, and one "well-known citizen." The bill would appropriate \$1,000,000 to commence work, though the estimated cost on present plans is \$23,000,000. The new canal would be 21½ feet deep, 23 miles long, and the locks would be 400 by 80 feet.

The importance of such a work is fast commending itself to the country at large. The Canadian work of quietly deepening the Welland canal, so as to make it serviceable for the largest ships and men-of-war as well, is a subject which demands prompt action on the part of our Government to be as well prepared as our neighbor for all possible contingencies. Aside from the possible advantage it would give them as belligerents, we have the more near contingency of commerce. The incisive action of the Canadian Pacific railroad, and of the Canadians generally, looks to a sharp competition in the near future on a commercial plane. The Canadians have already entered upon a system of "globe-encircling steamers," which will start from Montreal, Halifax and New York in the fall, so as to avoid the summer heat in India and the Suez canal. The route will run through London, Gibraltar, Malta, Suez, Penang, Colombo, Calcutta, Hong Kong, Yokohama and Vancouver, and passengers will be on the same steamer throughout the voyage.

The enterprise which will carry out such a program will not fail to take the fullest advantage of a complete water-way for the largest ships from the head-waters of the Mississippi to the ocean. The United States will come far short of its mission if it does not take immediate steps to secure at least the business of our own territory for our own transportation, along this great and rapidly growing line of commerce.

The idea of a line upon our side of Niagara to compete with the Welland canal, which is purely a Canadian water-way, is not a new project. It is only the revival of an old one, dating its first inception more than a century ago—in 1794, when the first survey of this route was made. In 1798, it was again discussed and recommended by Mr. Gallatin. At that time the "Great West" was almost a terra incognita, and there was no commerce west of Buffalo. The Welland canal was not even thought of. But the War of 1812 showed the necessity of such a water-way, and it was built on the wrong side. There should be no delay by Congress in rectifying the mistake.

THE NIAGARA CANAL, notwithstanding adverse reports circulated by parties whose interest lies in another direction, is in a good state of progress and the work will be completed much faster than is generally thought. Fifteen thousand men will soon be employed, among whom there will be 4000 skilled mechanics, and the work will then be pushed through in very short order. The extreme unhealthfulness of Panama does not exist in Nicaragua, and there will be less loss of life from climatic influences than on the isthmus.

THE THREE BLADED PROPELLER lately substituted for four blades in the twin screws of the Hamburg-American steamship *Angusta-Victoria* has so increased her speed that she is reported as averaging 20 knots in an 8 hour trial near Hamburg. The Columbia, of the same line, which is now claimed to be faster than the City of New York or the Teutonic, is also to have three-bladed propellers.

CHEAP OCEAN STEAMING.—It has been computed, as an illustration of the great cheapening of ocean freights which has taken place in recent years, that half a sheet of note-paper will develop sufficient power, when burned in connection with the triple expansion engine, to carry a ton a mile in an Atlantic steamer.

THE EAST RIVER TUNNEL PROJECT is undoubtedly making progress and is being pushed with energy. It has been long obstructed in the Bridge and Tunnel Committee of the New York Board of Aldermen, and the projectors of the tunnel propose to know the reason why.

ELECTRICITY.

Increasing Uses for Electricity.

The increasing uses for electricity are wonderful to contemplate. It is just announced that the electric light will be largely employed in dyalog works, where also electricity may be employed for other purposes. At night the light permits the matching of colors as in daylight, and in the daytime the current will be employed for electro-chemical purposes.

It has also been introduced as a tooth extractor. The instrument consists of adjustable prongs carrying buttons and connected with an electrical battery. The buttons are placed on the face over the nerve leading from the teeth to the brain, and a circuit is established the moment the extracting instrument touches the tooth to be removed.

Electric soldering is another late invention, which will do away with the cumbersome and inconvenient soldering rod which has been in use from time immemorial. The electric implement can be made much shorter and lighter and used without the heat being felt by those who handle it. Another advantage is that it never cools off unless the connection is broken. It is intended for use in large tinmith shops, where many are constantly employed.

An electric measuring device is one of the latest scientific applications of electricity, by which distances of visible but unapproachable objects can be readily measured. This method takes the place of the ordinary calculation, by which distance is measured by the difference of an angle from a known base line. By the new instrument the difference is obtained more readily and with a greater degree of accuracy. In practice two telescopes are used at a known distance apart and the principle is based upon the fact that by a simple electrical arrangement no current will pass unless the two telescopes are exactly parallel. The observer notes on one of the two telescopes the angle required to prevent a current from passing through the instrument, and thus measures or rather electrically weighs the difference in the angle. Thus a single observer, with an unlearned assistant, can determine with great rapidity the exact distance of a vessel or other object. The range-finder is designed for use in naval warfare to allow accurate firing of great guns, but if it proves as satisfactory in practical use as is claimed, it should prove far more useful in the pursuits of peace, where the determination of the exact distance of inaccessible objects is often of great importance.

An electric heater in the form of a floor mat constitutes one of the latest applications of electricity to household purposes. An excellent device for warming the toes, says the *Electrical Engineer*.

Electricity as a Motor.

Very general attention is being called to electricity as a motor on street railways. Under the latest improvements it is said to have proven such an eminent success and is so much more economical than either horse or cable power, that it is soon destined to become very generally the power for street-railway service. It is estimated that anywhere from 20,000 to 50,000 horses now in use will soon be thrown out of use by the coming motor.

The progress of the electric railway, especially in the United States, is shown in an article in the April number of *Scribner's Magazine*, in which the prediction is ventured that in ten years there will not be a horse railway in operation in this country, while the speed will be greatly increased in consequence of the greater control which the engineer will have over his car than can be obtained on either cable or horse-car roads.

It is claimed that the number of electric railways now operating and in course of construction in the United States is 179, representing 1260 miles of track.

Improvements in electric motors are constantly being announced. It has just been reported that a Pennsylvanian has invented an electric motor that excels any yet discovered. Once started, it is claimed, the motor will run 10,000 hours without requiring attention. A motor that will run for that length of time would be a novelty indeed.

Another report says that a new electric locomotive, just completed in New England, and designed to tow as many as four cars, weighs seven tons, and the size of the wheels is 36 inches. It is run by two motors of 20-horse power. It has an air-brake run by a one h. p. dynamo with a wheel. It runs easily 20 miles an hour. It has a fender much like the cow-catcher of a steam locomotive.

MYSTERIES OF ELECTRICITY.—Says the *Birmingham, Conn.*, correspondent of the *Ancient Sentinel*: As an illustration of what a subtle but strong power electricity is, one can see, at times when an electric car runs off the track, an interesting example. Saturday, a car was off with all the wheels away from the rails, but the motor-man took a light copper wire, connected it with the springs on the forward truck, then fastened the other end to a hammer-head and placed the hammer on the rails. This completed the circuit and sufficient current was sent through the little wire to move the car on the rough ground.

TABLE OF CONTENTS.

ILLUSTRATIONS.—An Ice Arch or Natural Tunnel Under a Glacier; Crèveasse, Grand Plateau; Crèveasse, Mer de Glace, 361. A Famous Manzanita, 363. Depression in Gravel Mine, Placer County; Ideal View of a Table Mountain in California; Spanish Peak; Position and Form of the Alpine Lakes, 369.
EDITORIALS.—Passing Events; Gold Mining in California; California Asphaltum; Aluminium; Foundry Notes; Miscellaneous, 368.
CORRESPONDENCE.—The Deep Gold Placers of California, 361. Note on Expelling Coarse Sand from Settlers; Mines and Mills of Shasta County, 362.
MISCELLANEOUS.—Mount Cory Mill; Coals Industrial Notes, 362. A Famous Manzanita, 363.
MECHANICAL PROGRESS.—Mechanical Improvements; Iron in the Coming Census; Miscellaneous, 366.
SCIENTIFIC PROGRESS.—Instinct vs. Skill; Astronomical Progress; The Heat Evolved by Animals; The Chinese Language; Miscellaneous, 366.
GOOD HEALTH.—How to Live Long; Love of Life; Miscellaneous, 367.
USEFUL INFORMATION.—How Base-Balls are Made; An Aluminium Fire Escape; Fire and Water from the Same Well; Miscellaneous, 367.
ENGINEERING NOTES.—The Niagara Falls Canal; Miscellaneous, 367.
ELECTRICITY.—Increasing Uses of Electricity; Electricity as a Motor; Miscellaneous, 367.
MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 364-365.
MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 372.
MARKET REPORTS.—Local Markets, Eastern Metal Markets, 372.

Business Announcements.

(NEW THIS WEEK.)

Patent Blow-Pipe and Assay Furnaces—Wm. Hoekins, Chicago, Ill.
De frequent Sale Notice—Gold Hill Mining Company.
Dividend Notice—Pacific Borax, Salt and Soda Company.
Agent and Com. any Promoter—Wm. H. Conley.
Only Mine For Sale—Nolan & Smith, Los Angeles.

See Advertising Columns.

Passing Events.

The Free Coinage Silver Convention of Nevada was commenced at Carson on Thursday of this week. As a leading silver-producer among the mining States, Nevada is vitally interested in the questions relating to the free coinage of silver.

The water in the Carson river is now at a higher stage than in any year since the mills were erected on its banks, and the pan-rooms are being flooded, rendering it impossible to operate more than two of the mills. While the present flood in the river will temporarily curtail the hullion yield of the Comstock mines, millmen are confident that the vast piles of snow still banked up in the Sierras will furnish water-power for operating the river mills throughout the summer, whereas in dry seasons the stamps are usually hung up from three to four months.

A movement is on foot in this city to obtain money to offer as a bonus for another transcontinental railroad to enter this city. Thence far, upward of \$70,000 have been subscribed. It is the intention to give the honor to the first road which enters the city, aside from that which now has its terminus here.

PETER HAMMERSTEIN, an employe of the Pacific Rolling-mill, had his elbow caught in the machinery, and before he could be extricated his right arm was frightfully crushed. Dr. Bunker amputated the member at the receiving hospital.

Gold Mining in California.

Rightly pursued, gold mining in California ought to be the safest and best-paying industry in which our people could engage. Our mineral territory is rich in the various forms of deposits of gold and of almost illimitable extent. For some 700 miles in length is a mountainous belt, in most parts of which gold is found. There are gold mines in San Diego county close to the Mexican border, and gold mines in Siskiyou and Del Norte counties, on the Oregon border, while between these extremes, on the gold belt, there is not a county where there are not more or less mines.

The mines and the country are open to all. They have not been, and never can be, monopolized to any injurious extent. The natural facilities for prosecuting the business are generally good. In most places there is water, and nearly everywhere timber. The climate is favorable. Forty years' experience has evolved the best methods of operation and improved appliances. It is known exactly what can be done with certain grades of ore and of gravel, and whatever uncertainty there may be lies in the character or permanency of the deposits themselves.

For the product of a gold mine there is always a prompt cash market. It never suffers by competition. There is no doubt about its ready sale. Trusts nor combinations do not affect it, and freight rates or distance have no disturbing influence. It is the basis of values; the standard for all other products; and the one thing for which everything else is produced and bartered. No legislation is needed for it; all countries receive it on an equality, and all men strive for it.

The mining for gold is a healthful, manly occupation, incapable of being overdone or excessively crowded. With a hundred times as many mines as we have, the products would not lessen in value nor would there be competition between the producers. There are quartz mines, hydraulic mines, drift mines, bar mines, river mines, beach mines, river bed mines, gulch mines—all producing gold, all being worked in different ways for the same product. Where rightly undertaken and prudently carried on, this work is attended with as little uncertainty as most other callings. There are of course blanks as well as prizes; but so there are in all industries. But the era of speculation having passed by, and that of legitimate business in this industry having been established, it is now conducted in this State on the same basis that exists in other enterprises.

THE STRIKE at Cokedale, Montana, has been settled, and the miners have returned to work. The terms of the agreement are that the miners shall receive \$1.10 for hard coal and \$1.05 for soft coal per ton of 2240 pounds. Laborers' wages around the mines will remain as formerly, \$2.50 per day. All the old hands who have committed no violence will be given work, but a few will be excluded from the mines. The men also agree to boycott two saloon-keepers, who, the company claim, have been the principal agitators of the strike.

A FROZEN MAN.—The schooner Dashing Wave has arrived in port from Sand point. Among her passengers from Alaska was John McLachlan, a Scotchman, who has been engaged in mining for several years. As a result of exposure his hands, ears and feet were frozen. Several fingers of his right hand have dropped off, leaving the flesh exposed, and some of his toes have also decayed.

EIGHTEEN MONTHS AGO, Mrs. Theodore Sutro resolved to try the influence of music on the average mining-camp child, and invited all the youngsters of Sutro, Nev., to singing lessons at the Sutro mansion. Instruction in slugging has been continued until the scholars of the tunnel town are all adepts. By a concert, they raised money and made needed improvements in the school building.

THE National Geographical Society has decided not to abandon the expedition to Alaska, and it will start some time next week. By direction of the Secretary of the Navy, the ship Pinta has been furnished for the trip.

Two large lumber-mills at Acacortes, Oregon, are kept running day and night to fill orders from the railroads for bridge timber.

Aluminium.

There is no other metal on the earth so widely scattered and occurring in such abundance as aluminium, yet it is never found metallic. But the combinations of aluminium with oxygen, the alkalies, fluorine, silicon and the acids, etc., are so numerous and occur so abundantly as not only to form mountain masses but to be also the bases of soils and clays. Especially numerous are the combinations with silicon and the other bases, which in the form of feldspar and mica mixed with quartz form granite. These combinations, by the influence of the atmosphere, air and water, are decomposed, the alkali is replaced or carried away, and the residue forms clays, the clays form soils, and thus the surface of the earth becomes porous to water and fruitful. It is a curious fact that aluminium has never been found in animals or plants, which would seem to show that it is not necessary to their growth and perhaps be injurious. Most of the aluminium compounds appear dull and disagreeable, such as feldspar, mica, pigments, gneiss, porphyry, trachyte, etc., yet there are others possessing extraordinary luster and so beautiful as to be classed as precious stones. Among these are the ruby, sapphire, garnet, turquoise and topaz.

One would suppose that since aluminium occurs in such abundance over the whole earth that we literally tread it under foot. It would be extracted and applied to numberless uses, being made as abundant and useful as iron. But such is not the case. Bauxite and cryolite are the minerals most used for producing aluminium, and their preference lies mainly in their purity. Native alums generally contain iron, which must be removed by expensive processes. Bauxite comes from Austria and France and has only been found in this country in Floyd county, Georgia. Cryolite comes from Greenland. It has been found in Colorado in very small quantity. Native sulphate of alumina has been found on the Gila river, Socorro county, N. M.

Those interested in the details concerning the physical properties of this metal, the processes for obtaining it and making its alloys, are referred to a book by Joseph W. Richards, entitled "Aluminium, Its History, Occurrence, Properties, Metallurgy and Application." The work is a well-written one and is sold for \$5 by the publishers, Henry Carey Baird & Co., Philadelphia.

Foundry Notes.

The strike of the iron-molders of this city has now lasted over 12 weeks and they are still out. Meantime, while the foundrymen have been greatly inconvenienced, new men have gradually been brought in from the East and now the shops are all running. Altogether 161 men and 40 boys struck in the 12 foundries. This occurred on March 31, but as soon as possible men were brought from the East and more are coming. While the shops have not yet their full quota of men, they are all doing very well under the circumstances, and the foundrymen are confident of eventually winning the contest. The molders, are, however, represented as equally confident, and have made no advances toward a settlement of the difficulties. The foundrymen are indifferent as to the attitude of the molders, being satisfied they can get on without any of the men who voluntarily left their work. A number more men came this week, seven of them having gone to the Risdon Iron Works.

During the past three months the foundry business in this city has been dull and unsatisfactory, mainly owing to the strike, and considerable work has been sent away which should have been done here.

In carrying out the contract for the new California-street cable line, the Risdon Iron Works must make some 300 tons of castings among the rest of the work, but they now have plenty of competent men to do this. This is the largest contract which has been let here since the strike commenced.

Mr. A. P. Brayton, after having been one of the proprietors of the Pacific Iron Works for 35 years, has retired from the firm and will hereafter be associated with the Pelton Water-Wheel Co.

A vast amount of work is being done on the new cruiser San Francisco, at the Union Iron

Works, and the yards now present a very busy sight. There are two large vessels undergoing repair on the dry-dock.

California Asphaltum.

Asphaltum is mined to a considerable extent in this State, but the annual production is quite irregular, being governed by the local demand. When a great deal of iron pipe is being laid, large quantities of the substance are used in coating it. Asphaltum is found in the counties of San Luis Obispo, Santa Clara, Ventura and Santa Barbara. Between 2000 and 3000 tons a year are shipped from the deposits.

The mines of the Ventura Asphalt Co. in the Canyon Diablo, Rancho San Miguelito, have come into prominence since 1888, when they were discovered. The material is found at or near the surface. About 1800 tons have been so far shipped from this deposit. More or less prospecting work has been done, but now large cuts or tunnels are being run into the deposit. At the point now being worked the elevation above sea level is 1300 feet, but frequent fossils of shells, shark's teeth, etc., are found, showing that the mass came up from the ocean.

The vein or bed crops out at many points in the shape of fingers or rounded masses connecting with the main body, the width and length of which are unknown, but upon which breasts of 45x16 feet have been worked.

The quality of this asphaltum is unique, possessing as it does great toughness and hardness, and a larger amount of fixed bitumen than other known deposits. The percentage of fixed bitumen is 24.40. It fluxes readily in oils, coal-tar, and by hydrocarbons, and may be made permanently of the hardness of stone or the pliability of india rubber, according to kind and quantity of flux (solvent) employed and the manner and time of melting, etc.

It has been successfully employed in street paving, and is found not to soften by heat or crack by frost. It is in use for this purpose in several cities in this State, Utah, Washington, British Columbia, Mexico, Guatemala, Sandwich Islands and Australia. For cementing masonry it has been put to use in San Francisco, Santa Barbara county and other places. The Southern Pacific Co. built a piece of seawall along the seashore, Ventura county, which was built up of round cobbles, cemented together by this asphalt. Two years' trial shows no indications of the wall being injured.

A peculiarity of the Ventura county asphalt is that it is elastic. The Santa Ana Water Co. used it for plastering a reservoir, having first laid up a wall of cobblestones on puddle and then plastering this with hot asphalt. In this open reservoir no change in the material is seen; even in places where the wall settled and cracked, the coating stretched and bent, remaining perfect and sustaining the water pressure. A pile coated with this asphalt was driven at Goat Island without destroying the coating. In doing this, the weight of 3000 pounds was dropped 22 feet on the pile. The material can be used for coating iron, planks, pipes, etc. Inquiries for the substance from the Eastern States, England, France, Australia, and Central America promise an important shipping business, unless other deposits with such exceptional properties are found.

THE REVENGE GOLD MINING Co., incorporated in this city this month, intend working 125 acres of a placer bar on the north fork of the Salmon river, Liberty district, Siskiyou Co. The gravel averages 40 feet deep, and the estimated value is \$7000 per acre. The water rights controlled are 5000 miner's inches, and 300 feet hydraulic pressure can be obtained. There is unrestricted liberty to dump debris in the streams, there being no agricultural lands and no navigation. They can have a mining season of eight or ten months, and will spend \$10,000 in improvements on the claim. Frank H. Hall is superintendent, Joline Howes president, and J. W. Pew secretary.

MRS. RICHARD A. PROCTOR, the widow of the famous astronomer, is visiting the Lick Observatory on Mount Hamilton, where she is the guest of Prof. S. W. Burnham. During her whole married life Mrs. Proctor ably assisted her husband in his astronomical observations and in the preparation of many of his interesting books. She has become well qualified to write and lecture on astronomical subjects.

The Deep Gold Placers of California.

(Concluded from page 362.)

Switzerland is crescent-shaped; its length is about 45 miles, greatest width 8½ miles, and extreme depth 1095 feet. The present surface is 1230 feet above sea level. It has an area of about 260 square miles. All of these lakes are now being filled with silt from somewhat distant glaciers—Maggiore by the Ticino, Como by the Mera and Adda, and Geneva by the Rhone.

It is a curious fact that these lakes, like the glaciers, are crescent-shaped or at least curved. The map (Fig. 17) from Biedeker's "Switzerland" shows the position and form of the Alpine lakes and the striking resemblance they bear to the so-called ancient river channels of California. And it is fair to assume that these beds are exceedingly irregular and

Fig. 18. - DEPRESSION IN GRAVEL MINE, PLUMAS COUNTY.

Fig. 16. - SPANISH PEAK, SEEN FROM ONION VALLEY, BASE OF PILOT PEAK

Fig. 17. - POSITION AND FORM OF THE ALPINE LAKES.

deeply channeled by the glaciers that formed them.

Glacial lakes are sometimes formed by terminal moraines, after a deep channel has been excavated by the glacier, also by landslides, many instances of which are on record.

In the opinion of Gaskie: "The only agent capable of excavating hollows out of solid rocks such as might form lake basins, is glacial ice. It is a remarkable fact, the significance of which may now be seen, that the innumerable lake basins of the northern hemisphere lie on the surfaces of intensely ice-worn rocks, the strata can be seen on the smooth rock surfaces slipping into the water on all sides. These strata were produced by the ice moving over the rocks. If the ice could, as the strata prove, descend into the rock basin and mount up the farther side, smoothing and striating the rock as it went, it could, to a certain degree at least, erode basins."

When a glacier flows over an uneven bedrock, some portions of the ice remain practically stationary, while others continue to move on. In this manner lake-beds are scooped out deeply if the rock is soft, for the crushing-power of the superincumbent ice is very great. This peculiarity of a glacier has an important bearing on our subject.

Mr. W. S. Chapman of San Francisco informed me that in the Union Consolidated Drift mine, at Portwine in Plumas county, a lake-like depression was discovered to which there was no outlet, the whole area, 40 feet deep and half a mile wide, being wholly prospected. There is no doubt as to the truth of this statement. The depression is filled with large boulders which lie also on the bedrock. At A and C as well as at B (Fig. 18), a river cannot flow down such a depression and up the other, but glacial ice can.

My theory assumes an ancient lake-bed in Plumas and Sierra counties which I have named "Lake Trask." I have not yet traced out its boundaries, although I have seen numerous evidences of its former existence. I am of the opinion that all the placers of the two counties are within its area. If I should not be able to continue my study on this subject, I hope others may do so, and either prove or disprove this theory.

The Gates Ore-Crusher.

The Western Agency of the Gates crusher has been transferred from the Pacific Iron Works to the Pelton Water Wheel Co., 121 Main street. This crusher has already been adopted by many of our most prominent mining companies, as well as for road macadam, and parties using them claim great advantages over other forms in the matter of durability of wearing parts, as well as fineness of product.

ELECTRICAL EXECUTION.—The Supreme Court has decided that Kemmler must die by the electric method. Chief Justice Fuller delivered the opinion of the court, which says that the New York Legislature and the New York courts carefully considered the question as to whether death by electricity was inhuman and cruel, and decided it was not as much so as death by hanging and other methods which have long been employed by the civilized world. Such unusual and cruel punishments as burning at the stake, disemboweling, or other torture would not be recognized by the law of civilized nations, but there seems to be no evidence that death by electricity is more cruel than the methods recognized by the Constitution.

The new steamboat for the Donabue line has been launched, and was brought over to the city last week for her machinery, which was built by the Fulton Iron Works. The boat is 290 feet long over all, and on its keel 270 feet. Its beam covers 73 feet, while the depth of the hold is 15½ feet. The immense engine of 250-horse power intended for this steamer will be equipped with a 65-inch cylinder, with a 12-foot stroke, and it is estimated that the speed of the boat will be equal to that of the San Rafael. The boat will be built principally for freight traffic, and will contain room enough for 16 freight cars. There will be passenger saloons on either side of the lower deck. The vessel will cost, when finished, \$230,000.

LOSS BY SILVER DISCOUNT.—The total ore-product of the Con. Cal. & Va. mine in 1889 was 135,190 tons, yielding bullion the gross value of which was \$3,238,468.85. The discount on silver on the above yield resulted in a loss of \$550,539 to shareholders during that year—a sum sufficient to have dishorsed five monthly dividends of 50 cents each. The average yield in bullion per ton was \$24. In the quarterly official returns from the mine the discount on silver is deducted.

The mining companies at Butte City, Montana, are experimenting on deep mining with the most satisfactory results. The Gaynor shaft has been sunk to the 900 level, and will be put down to the 1000.

ADJUSTERS have settled the Hartley Mining Company's loss at Grass Valley, by Saturday night's fire, for \$3306. The policies were for \$4000.

CONTRACTS have been let in Inyo county for burning 50,000 bushels of charcoal for smelting purposes.

AN exodus of miners from Tuscarora, Nev., to Butte City, Mont., is reported.

PARKE & LACY COMPANY

— IMPORTERS AND MANUFACTURERS OF —

MINING, MILL and GENERAL MACHINERY.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all
Mining and Manufacturing Machinery.
Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long
distances with small loss, and is now extensively used in
all parts of the country for generating both power and
light.

APPLICATIONS

Should state amount, and head of water, power required,
and for what purpose; with approximate length of pipe;
also, whether the application is with reference to *Wheels*
or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

121 MAIN ST., SAN FRANCISCO, CAL.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given
amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. ADDRESS AS ABOVE.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.
Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 29, 1890.

General trade is only fair. High water in some localities, melting snow in the mountains, harvesting in some sections, and harvest work to be started soon in others are against an immediate active trade. The tariff and silver questions are also against a free movement in goods.

Among the foundries and machine shops there is more life, with larger orders received and being executed. The molders' strike is virtually a thing of the past.

The money market continues easy, with no urgent demand from any particular quarter, while remittances from the interior are free. Large sums of money will be wanted in July, August and September with which to move the wheat crop.

MEXICAN DOLLARS—The market is quiet since the sailing of the last steamer for Hong Kong, and is strong at 80¢@81 cents.

SILVER—The market in London has held easy but steady, but in New York there was a gradual shading in prices. The action of the market looks as if the manipulators of silver certificates are bidding for shorts, and not to corner silver against the Mint, as the Director is reported as saying. The manipulation of silver presents a broad speculative field in this country, and also abroad, for all securities and commodities whose value is controlled by the price of silver move in sympathy with the latter. The recent advance and later decline in silver showed this to a remarkable extent, and more than proves the position this paper has taken on the question and the utmost importance of remonetizing silver. Leading English financial papers are beginning to advocate the further introduction of silver into circulation, with a strong leaning toward bimetalism. The action of Congress on the subject will have a strong bearing on the question abroad. It now looks as if no definite action will be taken by Congress on the silver bill until toward the close of June.

The local market has held steady at 103½ cts., Mint prices. Offerings are still light—said to be owing to the small output on the coast.

London cables quote silver to-day at 46½ d, a decline of ¼ d; while New York came through at 102½ cts., an advance of ¼ ct.

QUICKSILVER—Receipts the past week aggregate 92 flasks and exports 28 flasks to Guaymas. The market continues very strong under light obtainable supplies, good demand and strong markets abroad.

BORAX—Exports by sea the past week aggregate 335 lbs. to Honolulu and 100,264 lbs. to New York. Under a free output and offish buying the market is weak at quotations.

LIME—Receipts the past week aggregate 5406 bbls. and exports by sea 200 bbls. to Honolulu. The demand is only fair. While quotations are unchanged, some shading for round parcels can be secured.

LEAD—The market holds strong. At the East, continued activity is reported. The higher prices asked restrict any speculative movement. European advances report an easy market.

TIN—Imports the past week aggregate 100 boxes plate by overland rail, and exports 66,995 lbs. to Santa Rosalia. The market shows more strength, with plate fetching an advance. Prospective tariff legislation has some influence, as has the large run and active salmon canning on the Columbia river. It is also claimed that fruit-canners will use more this year. The higher price of silver is in favor of European holders.

COPPER—The market holds strong, with still better prices looked for if silver should advance to a higher range. The output in this country is steadily absorbed by home consumption and export demand. The latest London cables, May 22, to the Iron Age are as follows: A large business has been done in ingots at the advanced prices, and the demand is still heavy. A considerable quantity of matte has been taken for reshipment to America. Smelters and consumers are short of stock and have been anxious buyers, causing a steady reduction in spot supplies. Only small quantities are held by the trade, and a further rise is considered probable. French holders are conducting operations skillfully. At the present rate of manufacture, it is estimated that 12,500 tons more will be required this year for sulphate than was used last year. The visible supply decreased 3300 tons during the first half of the month.

IRON—The market is barely steady. The consumption is increasing, but the stock is large. The foundrymen are turning out more work, owing to having very nearly their full quota of molders.

COAL—Imports of coal the past week aggregate as follows: Seattle, 1150 tons; Tacoma, 2734; Coos Bay, 1200; Nainaimo, 1300; total, 6284 tons. The market for Australian is quiet but steady. For distant shipment there are sellers at slightly less than we quote, but these cargoes could not be expected here before the turn of 1891. English coals and freights are said to be too high to attract buyers. In coast coals the market is well supplied at unchanged quotations. No late advices are at hand regarding the miners' strike in the Wellington mine. Unless the strike continues for some time, it is not likely to have any effect on the coal market here.

Eastern Metal Markets.

By Telegraph.

NEW YORK, May 23.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday	47 1/16	1 03 1/4	15 10	4 20	20 85
Friday	47 1/16	1 03	15 10	4 20	20 85
Saturday	47 1/16	1 03	15 10	4 20	20 85
Sunday	47 1/16	1 03	15 10	4 20	20 85
Monday	47 1/16	1 03	15 10	4 20	20 85
Tuesday	47 1/16	1 03	15 10	4 20	20 85
Wednesday	47 1/16	1 03	15 10	4 20	20 85

NEW YORK, May 26.—California Borax is lower; refined and powdered, 83¢@84¢. The demand is light. Quicksilver is firm at the last advance, 73¢@74¢. The position of copper is strong here and abroad. Lake products held 15¢; Quincy sold at that; Arizona 14¢; Carling, 13¢. Nominally wants not large. Lead had a speculative advance. Sales, 900 tons, \$4.30@4.35; June and July, subsequently, \$4.40, down to \$4.20; last price high at close.

TO OHEMISTS.

A man with some knowledge of chemistry wishes employment in a laboratory, refinery, assayer's office or in the plant of a chemical works. Has good microscope. Would be a valuable assistant in a patent medicine manufacture. Address A. B. C., 2133 Elm Street, Oakland.

Assessment Notices.

ACME MILL AND MINING COMPANY; location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 2 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of June, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

The delinquent day of the above assessment is hereby POSTPONED to June 2, 1890, and the day of sale to MONDAY, June 23, 1890.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
San Francisco, May 15, 1890.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assaying Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market Street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assay; Faraday's Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Gres, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75 Sold by DEWEY & CO., Publishers, No. 220 Market St., S. F.

AMERICAN MINING AND STOCK CODE

"KELLOGGRAPH."

Indispensable to the Mining Profession and Useful in all Business Transactions.

A Complete System of Transmitting Telegraphic Messages by Code Cipher Words in a Legible, Secret and Economic Manner.

OVER 35,000 WORDS AND SENTENCES
Subject to transmission under infinite complication by the use of over 70,000 code words.

No danger of publicity in telegraphing matters concerning operation or sale of mining property. The work strictly alphabetical and classified. The handiest work ever published for mining operators.

PRICE, \$5. Forwarded postpaid on receipt of price by DEWEY & CO.,
220 MARKET STREET, SAN FRANCISCO.

Postmasters

are requested to be sure and notify us when this paper is not taken from their office. If not stopped promptly through oversight or other misadventure, do us the favor to write again.

A WELL DEVELOPED CEMENT GRAVEL MINE

In Placer County, three miles from C. P. Railroad; with steam hoisting and pumping plant, together with a 10-stamp mill, Fulton wheel, pipes, black mill shop, tools, cars and tank, all in good running order. Including 480 acres of land, of which 80 acres or more are well adapted to orange culture. The balance is timber land and pasture, suitable for grapevines and olives. Improvements consist of stone house of eight rooms, ditto barn, office, several frame houses, small orchard and vineyard. Price, including everything on the place, wagons, tools, etc., etc., \$85,000, of which half cash, balance at 7%. Title U. S. Patent. Immediate possession given. This is a rare opportunity for miners and horticulturists. For particulars apply to T. G. E. WOLLEB, East Oakland, Ca.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ore by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringements. For further particulars, address

ALMARIN B. PAUL,
Middle Creek P. O., Shasta County, California.

THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use.
It has fewer parts, requires less power, is simpler in
adjustment than any other. Feeds coarse ore or soft clay
alike uniformly, under one or all the stamps in a battery
as required.
In the Bunker Hill Mill it has run continuously for two
years, never having been out of order or costing a dollar
for repairs.

Machinery, Powder Mill Machinery, Water Wheels.

TUSTIN'S PULVERIZER.

Tustin's Pulverizer

WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish
Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Carliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

DEANE STEAM PUMP.

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,
Of Different Strengths as Required

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blast-
ing Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and
saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale

GENERAL AGENTS, SAN FRANCISCO CAL.

QUARTZ SCREENS

A specialty. Round, slot
or burr slot holes. Gen-
uine Russia Iron, Homo-
geneous Steel, Cast Steel or
American planished Iron.

Zinc, Copper or Brass Screens for all purposes. Cali-
fornia Perforating Screen Co., 145 & 147 Beale St., S. F.

COAL MINES OF THE WESTERN COAST.

A few copies of this work, the only one ever published
treating of Pacific Coast Coal Mining, have been ob-
tained, and are for sale at this office for \$2.50 per copy.
It was written by W. A. Goodyear, Mining and Civil
Engineer, formerly of the California State Geological
Survey.

VAN DUZEN & TIFT, CINCINNATI, O.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$900, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly,
THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 44 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal. }
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.
DAVID McKAY, Jr.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Hinkle's Ore-Roasting Furnace.

Engravings on this page show Philip Hinkle's improved vertical roasting furnace for sulphuretted ores. *A* represents the conveyor; *B*, elevator; *C*, vertical stack; *D*, section of stack; *E*, horizontal flue; *F*, shower flue; *S*, incline flue; *T*, cooling chambers; and *W*, the fires. The furnace consists of a vertical stack and cooling chamber, with two fires arranged near the bottom of the vertical stack and one near the top of the horizontal flue. There is a conveyor to feed the ore into the elevator buckets which carry it to the top of the stack and drop it into a funnel-shaped hopper. In this is a machine which drops the ore on to a revolving plate which throws it out by centrifugal force and distributes it uniformly in the top of the stack, so that every particle is worked upon by the fire to burn the sulphur as it drops from the top of the vertical stack to the bottom. There it piles up three or four feet deep. Then the gate is raised and it slides into a cooling chamber where it is raked in uniform height and remains until it finishes its work. After this, it is dropped into care and carried away, ready for amalgamation.

The light dust or ore carried by the draught through the upper fire goes through the horizontal flue into the shower flue, where it becomes dampened and drops to the bottom as the draught passes up the incline flue. Any accumulation of dust ores in the horizontal flue can be raked out. The outside shells of the vertical stack, horizontal flue and shower flue

ABANDONED HYDRAULIC MINE, SHOWING GROWTH OF YOUNG TREES.—See page 334.

HINKLE'S IMPROVED ROASTING FURNACE FOR SULPHURETTED ORES.

are made of cast iron and are lined with fire-brick. Mr. Philip Hinkle, 110 and 112 Beale St., will give further information concerning details to those who desire it.

LICK STATUARY.—The time having elapsed in which to present models of the proposed Lick etatuary, commemorative of the transition of this State from the Mexican to the American period, which is to be erected on the plat eet apart opposite the new City Hall, the artists who were making designs have commenced to arrange their models at the Mechanics' Institute pavilion, where they will soon be on exhibition.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Powell's Arid Argument on Irrigation.

EDITORS PRESS:—In the April *Century* there is an article by Major Powell, entitled "The Non-Irrigable Lands of the Arid Region." The title has only a slight connection with the contents. The article is largely devoted to the forests of the arid regions of the West. As far as accepted scientific forestry is concerned, Major Powell's views are revolutionary. His only attempt to sustain views at variance with those now received with any data or proof is an indefinite citation of certain alleged investigations in the Wasatch range and elsewhere.

To set up such a bald and vague statement against the experience and writings of every prominent forestry man of whom we have knowledge, is certainly extraordinary. It would be so for any one; it is especially so for a prominent government official engaged in scientific pursuits.

We have indeed found in California that trees immediately about a spring or directly upon a water-course, do not always increase the flow of water, and may even diminish it either by such a detention as allows the percolation of the water into the soil, or by leaf evaporation. With us, riparian trees are gross water-users and usually deciduous, such as sycamores, alders, willows, cottonwoods, etc. Even in this case, the mass of testimony is in favor of the trees. The mountain springs and streams here sink in the valleys before finding a junction with the sea. As the trees on their immediate banks are cut, we find them sink lower, as a rule, and shorten their courses. In a foggy or cloudy day the water of these streams runs out farther into the valleys, so it does at night. We may compare the effect of the trees to the effect of the clouds or night in preventing or diminishing direct evaporation by the sun. The effect of some large water-using trees immediately about springs or on small streams is still an open question.

But upon the mountains the trees are of a different class, and their effect is, without known exception, beneficial to irrigators and water-users in the valleys below. Major Powell says, page 920, that forests may be useful on river-courses in humid countries to prevent the streams from being too large and creating floods, but that in arid countries the trees take up and evaporate about 40 per cent of the rainfall into the air; that the snows melt faster in forests, and that the volume of water in a stream will be larger if its watershed be bare than if it were wooded. "For all these reasons the forests of the upper regions are not advantageous to the people of the valleys who depend on the streams for the fertilization of the farms."

Such authorities as J. C. Brown, Becquerel, Marchand, Siemoni, Hummel, Piper, W. C. Bryant, Marsh, Van Reenan, Sorell, Ladouette, Canteguil, Wex, Berghaus, Maass, Grehenau, Ebermayer and a host of others are all without an exception known to me opposed to this view of Powell's. Time, place and instance have been cited over and over again to show that the denudation of mountain districts is followed by increased torrent or flood action and diminished regular flow in springs and streams, often by the entire desiccation of these. In my reading, as in my observation as a forest officer, I have never read or known of an instance to warrant Powell's theory. It is at variance with all the known facts.

In regard to Powell's statement that the evaporation from a forest surface is greater than from denuded hillsides, the data or proof are quite absent.

We have, on the other hand, a very considerable number of reliable experiments to show that Powell's statements are totally wrong. According to Ebermayer, for instance, the following percentages of the rainfall were found in the summer at the depth of one meter:

	With litter.	Without litter.
In open ground.....	39	14.....11
In the forest.....	62	72.....66
Difference.....	33	58.....54

Every one with the most common powers of observation and any experience knows that the soil remains humid longer in a forest than on bare open lands; so also snow remains longer under trees than in the open. Powell's article may please the forest-destroying interests, but its points are contradicted not only by authority, but by every American's experience of the effects of forest destruction upon the flow of streams. Here in California, instances are already piled up for the inquirer. Some of these may be found in the first report of the State Board of Forestry. When the forests are destroyed, the streams diminish. We have in such case our streams alternating between violent and destructive torrents and dry beds of sand and boulders.

The testimony on this point is so large, so circumstantial, so complete, so uncontradicted, that it becomes a waste of energy to confute further the mere *ipse dixit* of a special pleader.

Powell confutes himself, for he says a few lines further on in speaking of the proposed storage reservoir:

"Storm waters wash the sands from naked hills and mountains, and bear them on to the

creaks and rivers, by which they are carried to the storage basins."

Here the excellent Major describes torrent action, but he stops at the reservoir and does not descend his detritus-laden stream to the farms below. As soon as such a stream leaves the steep grades of the mountain it drops its load, fills its bed and changes its course. No one is safe in the bottom lands. I can show a number of instances of this sort of action in California alone.

But the most surprising part of Major Powell's article is his narration without a word of apology or regret—in fact rather proudly, of how he deliberately set fire to a giant pine tree in the forests of Colorado. He saw this fire mount and blaze and burn the tree; he saw it spread into the forest; he did nothing to stop it. He goes on to describe how grandly it burned and ends thus: "On its swept for miles and scores of miles, from day to day, until more timber was destroyed than has been used by the people of Colorado for the last ten years."

General principles are sufficient to condemn such a willful and wanton destruction of property, still more so of a property of which he as a Government officer was a trustee for the people. Besides this, however, his act was a violation of the laws of Colorado. If the crime had been committed here, he would have been punishable by both fine and imprisonment.

Arid Lands Irrigation.

In the May number of the *Century* is another article by Major Powell which this time says something about arid lands irrigation. The recommendations of the last article as to forestry with which pasturage is mixed up are diametrically opposed to the arguments of their utility in the first article. It sounds like the hedging of a political office-seeker without convictions. The whole composition is a jumble to which there is neither head nor tail. As one instance outside of forestry he recommends that irrigation work should be only undertaken by actual settlers in corporate combination. This sounds fine, but on the vast Mojave desert and on the wide and fiery stretches of the Colorado, there is no water. Settlers cannot come there and acquire lands without water, consequently corporate combination of settlers is an incompetent, because non-existent, agency in reclaiming these deserts. The settlers can only come after reclamation and cannot be a thing precedent to it. Herbert irrigation enterprises have been undertaken to enlarge small uses of streams by individuals in sections already habitable without these enterprises and by corporations, combinations or syndicates, controlling large bodies of land already as a rule productive for pasturage, if for nothing else—the inducement being the immense increase of production through irrigation. The conditions of the great Western deserts of Utah, Nevada, Arizona and Colorado, with which I am acquainted are different. Speaking generally, these vast desert areas are now incapable of producing any agricultural return to man. They are uninhabitable. The works necessary for their reclamation require grand storage and aqueduct works, entailing large expenditures of capital. Wisely undertaken, such works will undoubtedly prove as grand in their returns as they are grand in their conception. They must be undertaken by corporations or by the Government. The people will prefer the Government.

Major Powell's plan of non-existing and non-existent settlers undertaking such works is the conception of a political pander. The whole of this arid lands business seems to be in the wildest confusion. We now hear that the appropriation is to be spent in boring artesian wells in Dakota. The whole of Dakota that is capable under any conditions of sustaining humanity is already thus capable, after some sort of fashion. But this is not the case in the enormous areas of parched lands in the districts of the South. The soil here is exceedingly rich, and with water and the Southern sun gives immense returns to labor. Here exist the mountains with catobment basins, water-sheds and rainfall sufficient for a great portion of the country. It is here that the work should be done on the arid land irrigation, for it is here that not only the opening for snob work exists, but the conditions preclude the possibility of private enterprise accomplishing results.

Where other conditions exist, as in Dakota, etc., the Government had best limit its activity to preserving the mountain water-shed forests. The forests in all the arid and semi-arid region must be preserved if the region is to attain its highest development. The people will see and recognize this fact, no matter what pleadings special interests may set up to hide it.

ABBOT KINNEY.

Lamanda Park, Los Angeles Co.

RAILWAYS IN CHINA.—The extensive railway building some time ago contemplated in China is still held back by governmental opposition, but a short extension of the little road running to the Kaiping coal mines has been ordered to be made to the mines of Linai and the contract for rails has been let to a British firm. When China awakes and commences railway building in earnest, American manufacturers will be pretty sure to have a share of it.

ELECTRICITY IN ENGLAND.—It is well known that in the application of electricity, England is far behind America, but there are not wanting signs that the English are slowly but surely adopting electric light and power.

The Deep Gold Placers of California.

NUMBER X.—CONCLUDED.

[Written for the PRESS and Copyrighted 1890, by HENRY G. HANKS, F. G. S. A., F. G. S.]

Landslides.

The nature of landslides is indicated by the name, but it is not until they assume considerable proportions that they are so designated. An avalanche is a moving body of snow and ice. While it generally loosens earth and uproots trees in its course, it is not to be confounded with a landslide, which does not depend on snow for its motion. Landslides large and small, produce very considerable geological changes. The earthy matter after its transfer to a lower level is more easily washed away by water.

Landslides are very frequent in the Alps. The name "éboulement" or "éboulement de terre" has been applied to them, meaning a falling or sinking of the earth. Many instances have become historical, in which the summits or large portions of mountains have either fallen in mass into the valley below or have slid down an inclined plane of resistant rock.

In 1618, Mount Conto in Switzerland slid down and buried Pirra, a village containing 2430 inhabitants. The people carried on the manufacture of cooking-vessels of ollite, a variety of steatite or soapstone, in the quarrying of which the mountain was partly undermined. In 1714, a considerable portion of Mount Diableret fell into the valley, by which many lives were lost. The beds of several mountain torrents were filled and lakes thus formed; some streams changed their course. In 1751, a mountain near Servoz, in Savoy, fell, spreading ruin and death. The dust which rose is said to have darkened the air.

During an earthquake in Lugo county in September, 1868, boulders of large size rolled down the mountain-sides into the valleys. In Kings River Canyon the earth shook at short intervals for several days. During some of the earthquakes there were landslides and the downfall of large rock masses. The valley being uninhabited, no damage was done. A detailed account of these phenomena may be found in the Proceedings of the California Academy of Sciences, Vol. IV, fol. 33.

A landslide sometimes dams up the bed of a mountain torrent and causes the water to accumulate until, gaining strength and overcoming the barrier, it floods the valley below with sudden energy. A case of this nature occurred in Switzerland in 1818. Detached blocks from the Glacier de Getroz intercepted the flow of the east branch of the Dranse in the Val de Bagne, when a great lake was formed which finally burst its banks, and the rush of water caused landslides and widespread devastation.

There is a general tendency of elevated land to gravitate to a lower level, which seldom terminates in a landslide. I have for a number of years resided near the summit of one of the highest hills in San Francisco, during which time I have been engaged in a continual warfare against the slow movement of the ground toward the bay, and have noticed with dissatisfaction that the strongest cement walls I could construct would soon crack and ewerve from the perpendicular. This being repaired, the same would occur again, until becoming interested, I began a series of experiments which clearly proved that the whole hill is gradually wearing away and that it is only a matter of time when it will become obliterated.

Avalanches.

An avalanche is a large body of snow in rapid motion down a mountain declivity. Snow is not an avalanche before it commences to move, and ceases to be one when again at rest. When snow lies deeply on a steep incline, the attraction of gravitation maintains a steady pull upon it which for a time it resists, but with a greater accumulation, or when the masses become more yielding by change of temperature or falling rain, it is sometimes overcome and commences to move, slowly at first, but with accelerated velocity until it comes to a standstill in some valley far down the mountain-side.

When it starts from its first position, it is wholly snow, but as it descends it gathers rocks or detaches them; snaps off trunks of the largest trees—sweeping away whole forests in its course. When motion finally ceases, it is a mass of snow, ice, earth, rocks and broken trees in a state of the utmost confusion. It is at the commencement noiseless, but as it rushes along, a combination of sounds is heard which it is difficult to describe. The entire event does not occupy many minutes, in some cases only seconds of time, but its effects are on a grand scale.

In the Yosemite valley, which I visited in 1862 for the second time, I noticed many places where trees had been broken off in the wide path of numerous avalanches. These are as common in California as in Switzerland, and presumably so wherever high snowy mountains exist.

These eweeping snow and land slides do a great deal of geological work, and supplement the glaciers in mountain erosion.

Cloudburst Phenomena.

A cloudburst, or "waterspout" as it is sometimes called, is a sudden condensation of aqueous vapor on a mountain-side, generally

in an arid district. It cannot be likened to a heavy shower or thunder-storm.

The typical cloudburst generally if not invariably occurs during a period of intense heat or drought. The first indication is a distant and low sound of thunder. A mass of clouds, white if the sunlight falls on it, otherwise dark, moves rapidly toward the mountain, and sweeping up the side, settles on the summit. Immediately a great volume of water may be seen flowing toward the distant mesa. Seeking its level, it rushes with great impetuosity down any accidental natural canyon or one formed by a similar deluge in the past.

The flow is so violent that new channels are frequently cut in the loose sands whereby boulders and rock masses which lay hidden, are unnovered and even moved to a considerable distance down the grade.

While these gushes of water are infrequent when gauged by personal experience, in a geological sense they have been very numerous, for vast areas in arid California have been eroded by them. The effects they produce extend far beyond the point of condensation, for the flood follows channels until its force is expended, or until the water reaches a level plain, spreads out, and sinks in the thirsty sands of the desert.

When met in the canyons by travelers or prospectors who have no warning of the coming flood, the appearance is very alarming. The first intimation is a low but increasing roar, which is so well understood by the mountaineer that he at once seeks some elevated point beyond its reach. The increasing sound of its approach is followed by the sight of the water front, sometimes ten feet high and many yards broad, filling the entire channel. The boiling, rolling tide stirs up the dry sand in a strange manner. Debris of various kinds is pushed forward and rolled under the onrushing water front. Soon the channel has the appearance of a mountain torrent, but it quickly falls, and in a few hours the bed is again empty, and in two days is as dry as before, so that no evidence of the recent flood remains except some change in the bed, the placement of a few broken tree-trunks, or the changed position of isolated boulders.

To those who have no experience, the meeting of these floods is a circumstance of great danger, the more so as most of the roads and trails lead through canyons, the dry beds of former floods. Many instances of loss of life and property under such circumstances have been known and published.

Numerous mountain canyons in the desert part of the State have been cut and many times enlarged by a succession of cloudbursts extending over a period of centuries, and the tall which invariably spread, delta like, from the debouchure of each, are proof of this.

Blackhawk canyon, which lies on the eastern slope of the San Bernardino foothills, is a type of this class of erosion. Without a knowledge of cloudburst phenomena its origin would be to me inexplicable. The experience of a prospector as related to me by himself cannot fail to be interesting in this connection. The event occurred during the same season that I examined Blackhawk, and the locality was Rattlesnake canyon, only a few miles distant.

My informant camped in the canyon in mid-summer with his wife, his object being to explore and do assessment work on a mining claim. One torrid afternoon the ominous sound was heard, and being an experienced mountaineer, he quickly helped his companion up the rocky aide of the canyon to a higher elevation, and this not a moment too soon, for the flood rose nearly to their feet, while it swept away every movable object, including the entire camp and fixtures, and fell within a few hours, leaving the canyon dry as before. While it is certain that many similar floods have rushed down this canyon, no calculation can be made when another will do so. It may and probably will be many years. The talus at the mouth of Blackhawk canyon is composed principally of fragments of metamorphic limestone washed away from the immense calcareous cliffs which are exposed at this wonderful locality.

The duration of a cloudburst being so brief, rock fragments torn from their position and moved by it are never waterworn, and the blocks which compose the immense talus which skirt the base of the mountains in that portion of the State where this phenomenon is of frequent occurrence, are invariably angular, and the rocks, generally of a soft, yielding nature, are wholly unlike the rounded quartz boulders which result from glacial erosion.

Cloudbursts are not peculiar to California or the Pacific Coast, but are frequent in other countries. One of unusually destructive character recently occurred in China, and is thus described in the *Shanghai Mercury* of Jan. 7, 1890:

"On the 7th of this moon, in the Yangtse river near Nankio, at about 10 A. M., when the weather was bright, there was suddenly heard a rushing noise as of water, when two large black clouds appeared, and they soon enveloped everything like a thick fog. The two black clouds appeared to be fighting, at the sight of which the waters were much disturbed and the river was full of large waves. The two huge clouds eventually reached a place called Tsit Li-chow, when they burst asunder, making a very loud report. During the disturbance many boats were destroyed and over 100 people were drowned, and more than 50 were picked up in an exhausted condition by the Chinese Life-Preserving Association. Those who lost their lives were hurried by the

astherities. A long strip of the river-bank has also caved in."

We need not go far for examples of both landslides and avalanches, for the present winter has furnished the conditions to cause them on a grand scale in the Pacific Coast mountains. The following are extracts from local newspapers in which they are described:

"SAN JOSE, Santa Clara Co., Cal., Dec. 26, 1889.—The house of Jose Luis Mesa stood in the gulch at the foot of a long, steep ridge, about five miles east of Evergreen, and was occupied by Mesa, his wife and a child. The continuous rain of the last month and a half had loosened the surface of the whole mountain-side, however, and at about 11 o'clock a large mass of dirt, mud, rocks and boulders was loosened from a point on the hill fully a quarter of a mile above where the house of Mesa was situated. Gaining velocity at every turn, the slide sped on its mission of destruction and struck the house with great force. The house was crushed to pieces and the little girl carried some thirty yards from the spot, lodging against a tree and being covered with three or four feet of mud and rocks. By a miracle, apparently, Mesa and his wife escaped with their lives, but were terribly bruised by the mass of stones."

"DELTA, Shasta Co., Cal., Jan. 24, 1890.—There have been several large slides along the road. There is one at the north end of the tunnel, nine miles north of here. There is one of about 100 tons of rock and dirt and another large one a mile north of here. There is a slide reported south of here, making it impossible for trains to get to Sims with fuel or provisions."

"WALLACE (I. T.), Feb. 7, 1890.—The reports sent out from Coeur d'Alene city of a terrible accident at the Custer mine, were not exaggerated in the least. A snowslide occurred at 6 o'clock in the evening as 18 men were eating their dinner in the boarding house connected with the mine. The slide started at the top of the mountain about 300 feet above the boarding-house, and leveled every tree to the bottom of the gulch."

"The boarding-house was ground into splinters, six of the occupants being killed and as many more seriously wounded. Many slides are reported in all directions."

"Four men were buried in a slide in Canyon Creek gulch, but two of them escaped alive; the other two perished."

"The slides at Barke were more serious than we at first reported. Two buildings containing families were struck and carried clear across the gulch, but no one was killed. Several other unoccupied houses were wrecked, and most of the inhabitants of the town moved farther up the gulch where there was no danger from slides."

"About a mile and a half below town, a big slide occurred and struck a railroad camp, killing three men. At the Gem mine, the flume was carried away. The San Francisco tramway and a great portion of the flume was also destroyed. This side of Wallace, near the Argentine mine, a slide occurred, which buried the Coeur d'Alene narrow gauge and the Washington and Idaho tracks under 75 feet of snow. At Mullan, several slides occurred. No loss of life is reported, but the damage to property is great."

"At Wardner, the Emma and Last Chance mines tramways were carried away. The blacksmith's shop was destroyed and several other buildings wrecked, but no loss of life occurred."

"WEAVERVILLE, Trinity Co., Cal., Feb. 13, 1890.—Tidings were received last evening of a whole mountain's sliding on Dixon's Bar, 50 miles from Weaverville, Feb. 3, completely damming the Trinity river. Two Chinamen mining on the river were buried beneath the immense mass of earth, rock and trees."

"The river was running brimfull at the time, and the water backed up with frightful rapidity. A house, and barn filled with hay were swept away by the large volume of back water. The owner had just time to drive his stock to a place of safety and escape. Near San Juan Point the water came up to the front door of a residence 300 feet above the river, and a house two miles above was swept away with all its contents. The river backed up 12 miles and was dammed for seven hours, forming a vast lake. The water forced its way through, but as yet has not cut a sufficient channel. This is the largest slide recorded in Trinity county, and Weaverville people never heard of one in the State to equal it."

"SIERRA CITY, SIERRA Co., CAL., Jan. 3, 1890.—A snowslide came rushing down the hillside upon this city this afternoon, destroying the Roman Catholic church and several houses, carrying a number of others from their foundations, and causing the death of seven persons and possibly nine. The snow, which lay a dozen feet deep, started at the Sierra Butte flume, on the hillside above the town, and swept down with resistless force, carrying everything before it. Some almost miraculous escapes from death occurred."

"As soon as possible, the survivors began digging in the debris, and up to this writing seven bodies have been recovered. All is confusion at the scene of the accident, and it is impossible as yet to obtain any particulars, so sudden was the disaster. Many bodies may be buried in the mass of snow, logs, furniture and general wreckage."

"More slides are expected, and the people are in constant dread, but the snow is so deep that flight is impossible. All they can do is to wait and hope that the immense weight of snow

now hanging on the mountain-sides may not become loosened and complete this fearful work of destruction."

"SIERRA CITY, Jan. 4.—The fatal landslide occurred about 3 o'clock Friday afternoon. A body of snow fell from a bluff of rocks just below the Sierra Mune Company's flume at a point a quarter of a mile east of the center of Sierra City, and at an altitude of 1100 feet from the county road. The point of starting was at the head of a ravine in which the snow lay to a depth of from 25 to 30 feet. This started a slide in the ravine, which, hurrying down the side of the mountain, gained enormous volume and speed downward."

"The slide was what mountaineers term a 'lightning slide'—that is, the snow moves bodily down the mountain-side as distinguished from a hill-slide, in which the snow takes globular form and honnds downward as a ball would do. The slide followed the course of the ravine to a flat, leaping 100 feet at a bound over the county road, at which point the accumulated snow on the flat turned it, and it then made straight for the upper end of the town."

"A small hollow caused it to again turn, nearly at a right angle, and it then took its course right across the upper end of Bush's Flat. Several houses were instantly and completely raised. Not a timber was left standing, and the occupants of two were crushed to death."

"Those unacquainted with the action of snow on mountain-sides can hardly realize the awful swiftness and force of snowslides. The slide traveled a mile and a quarter in less than a minute. No warning was given and there was no chance of escape. Apparently all the victims were killed without time enough to move hand or foot."

"The entire village was thrown into a state of dread, and all the residents of the upper end of town immediately left their homes and came down to the hotels where less danger was felt."

"HOMER, Mono Co., Cal., Feb. 1, 1890.—Four months ago to-day the storm began, and with a few intermissions of an hour or two each, has raged with unprecedented violence ever since. Nothing like it was ever before experienced in these mountains, or any other that we know of. At least 50 feet of snow has fallen; in many places it is hundreds of feet in depth. The sides of the mountains are overloaded, and there is extreme danger from avalanches in every direction."

"Last Saturday the camp was in a high fever of fear. All day long snowslides were tumbling and thundering, bringing down immense masses of rock and timber and piling them up into grotesque and fantastic mounds, some of which were of huge dimensions. Everybody was nervously anxious, for disastrous results seemed imminent. The gloomiest anticipations prevailed. Both walls of the narrow canyon were covered with immense banks of snow ready to fall and entomb us, and no one place appeared to be more secure than another."

"In the morning, a terrific slide came down from a deep gorge on the northern flank of Mount Gilchrist. Starting from a point about 3000 feet above the town, it was augmented by slides from confluent canyons until its proportions were enormous and with accelerated velocity it barged down the precipitous hill like a flood of molten silver. When it struck the lake, there was a thundering crash of six-foot ice, followed instantly by cannon-like reports on the other side of the lake, as compressed air escaped from blowholes in the ice. Some of these vents, however, emitted sounds like the hoarse roar of a steam fog-horn."

"After a brief interval, another slide started from the southern escarpment of Mount Hector, on the other side of the lake. As it gathered material it accumulated speed, rolling over and over like breakers on a sloping shore and throwing feathery spray hundreds of yards ahead, until it shot out on the lake like a flash, and lay, an inert mass of glittering white, akin to a glacier in solidity. The sight was weirdly and appallingly grand, so startling in its magnificence that the few beholders were prompted to kneel in adoration. It is at once awful and sublime to see a large slice of earth in swift motion; but the sensation becomes one of abject fear when a person realizes the infinite danger that hovers in the track of one of these fascinating spectacles."

"The rain that falls on elevated lands does its humble work without notice, but in the aggregate it assumes enormous proportions."

"Constant freezing and thawing, and even long saturation by water, will disintegrate rocks, and especially soft slates and shales. This is observable near Laporte, Plumas county. Little piles of debris may be seen at the foot of all vertical banks thus loosened and caused to fall in miniature falls. Disintegration by frost has been studied in Greenland and is the admitted cause of considerable geological change in surface rocks."

"Denudation by saturation was illustrated in San Francisco during the recent unusually wet winter. On the hills in many places, rocks crumbled and fell from bluffs on the sides of newly graded streets."

"While I claim so much for local glacial erosion in California, I do not mean to belittle erosion produced by rivers and other forms of water in motion."

"Rivers not only erode deep channels but convey matter in suspension to localities far from their source. This is not only the case with rivers flowing with rapidity in mountain lands, but with great streams moving slowly on

plains. If a vessel is dipped into the Ganges at flood and the water allowed to stand undisturbed for a time, a deposit of sediment will fall which is equal to one-fourth its volume. The Yellow river in China conveys 2,000,000 cubic feet of sediment each hour."

"Aria, once the seaport which gave its name to the Adriatic, is now far inland. The delta of the Colorado in all probability filled a portion of the Gulf of California, which once extended over the now Colorado desert. The whole Sacramento valley is composed of debris from the mountains."

"Great rivers flow slowly, and unlike mountain torrents, the mineral matter they hold in suspension is extremely finely divided. The Ganges at 1800 miles from its mouth is only 800 feet above the sea level, and from that point the water is one month reaching the sea. The Rio del Plata flows so slowly that ships can sail up against the current for 1500 miles."

"Although this is the case, geological changes wrought by rivers are on a gigantic scale; these operations never cease. The Mississippi will eventually fill up the Gulf of Mexico, as did many other rivers, now dead, fill other gulfs now great deposits of sedimentary matter and dry land."

"Here a thoughtful mind sees evidence of design for the maintenance of animal and vegetable life. Were not this the case, vast numbers of beings now in the enjoyment of existence could never have lived."

"It is the order of nature that inorganic matter should precede and furnish food for vegetable forms, which in turn supply animal life with subsistence, and it is the ceaseless changes before referred to, that produce the necessary conditions."

"Malthus has shown that man can only live on the earth to the extent to which he can obtain food. If all organic matter was in use by living animals, no more life could be possible until a portion had paid the debt of nature."

"In the process of agriculture the fertility of the soil is being continually exhausted. To restore this, mountains and elevated lands are eroded by the forces we have considered, all of which thus take part in the economy of nature."

"The example of the Nile, which for many centuries has maintained the fertility of Egypt intact, is certainly worthy of consideration. The valley of this great river has been cultivated for 3000 years. The river commences to rise in June. The Nilometer at El Rodah indicates from 18 to 27 feet. If less than the former number, the overflow is considered scanty; the letter is good, but if exceeded, it is a destructive flood. The silt deposit is about 4 1/2 inches in a century."

"Diodorus Siculus thus describes the overflow of the Nile 2000 years ago, and relates the advantage taken of it by the ancient Egyptians:

"Book I, Chap. III: 'Mountains stand on both sides of the river, and the river forcing itself with great violence against strait and narrow precipices, the water is driven back and flows over the neighboring fields.'"

"This island" (the delta) "has in it many dikes and sluices cut by art, and is the most sweet and pleasant part of Egypt, for being enriched and watered by the river, it produces all kinds of grains and the other fruits, and by the yearly overflowing of the river the face of the ground is continually renewed and the inhabitants have an easy way to water it by a certain engine invented by Archimedes, the Syracusan, which from its form is called *Choclia*, and whereas the Nile flows gently over it and brings with it much soil, which, resting in low and hollow grounds, makes very rich marshes."

"The inundation begins in the summer solstise and increases until the equinoctial in autumn, during which time he hangs along with him new soil and waters, as well the tilled and new ground as that which lies waste and untilled, so long as it pleases the husbandman; for the waters flowing gently and by degree, they easily divert its course by casting up small banks of earth, and then, by opening a passage for it, as easily turn it over their land again if they see fit needful."

"It is so very advantageous to the inhabitant, and done with so little pain, that most of the country people turn their cattle into the sowed ground to eat and tread down the corn, and three or four months after they reap it."

"Some lightly run over the surface of the earth with a plow after the water is fallen, and gain a mighty crop without any great cost or pains."

"When other rivers about the solstise fall and grow lower all summer, this begins to increase and continues to rise every day until it comes to that height that it overflows all Egypt, and on the contrary in the same manner in the winter it falls by degrees until it wholly returns to its proper channel, and in regard the land of Egypt lies low and champion; the towns and country villages, that are built on rising ground, (cast up by art) look like the islands of the Cyclades."

"River silt is the best of all fertilizers, and here the idea occurs to me that perhaps the mode of leveling the rivers of California was a mistake."

"To confine the rivers within their low-water channels is to cause suspended fertility to flow into the seas and ocean, instead of being thinly spread over the bottom-lands to their benefit."

"Levees not only do not entirely prevent overflow, but when an unusual flood occurs, act as barriers to prevent the recession of the water after irrigation and fertilization have been accomplished."

"If there were no levees, the waters would not rise as high as now, and would quickly retire with the falling of the river. The sites of towns could be raised as that of Sacramento has been, and areas sufficiently elevated for farm buildings, as in Egypt, could be built and maintained at less cost, perhaps, than the present levee system."

"The miner does not consume the water he uses in his mining operations; if he did, there would be no complaint, or at least he would not send down the objectionable debris. When he has availed himself of the power created by the fall from one level to another, he practically returns it all to the head of the stream, from which it may be drawn by the irrigator below. The agriculturist has no surplus to return, and even while the population of the State is sparse, there is not sufficient water to supply the wants of all. With increasing numbers, conflicting interests will multiply, and the people of California find that the water question is far from being settled."

"It has been shown that erosion sets gold free and places it within the reach of man. We find the same forces applied in the interest of agriculture. Can we expect to reap this double advantage without drawback? Inasmuch as we cannot prevent the filling of river channels, lake-beds and inland bays by the forces of Nature, let us not overlook the prospective gain, but join hands in utilizing the natural resources of the State, both mineral and agricultural, without discord, or injustice to either interest."

"If some plan could be devised reconciling the interests of both farmer and miner so that the latter could increase the production of gold, it would greatly benefit the State."

"My study of the deep placers of California confirms my opinion that they are more extensive than generally supposed. I believe they can and will be worked on a much greater scale, and that as we become more familiar with their features and peculiarities we shall be able to discover others at localities now unknown."

"Drift mines are expensive to open and costly to work, but gold the world must and will have, as long as it is possible to obtain it, and as it becomes scarce and consequently more valuable, all difficulties will be overcome in the exploitation of the great natural treasures I have attempted to describe."

Mineral Exhibit for the World's Fair at Chicago.

EDITORS PRESS:—Having been, in connection with Prof. Henry G. Hanks, Mr. Melville Attwood and Sol Haydenfeldt, Jr., an active worker in getting up the California mineral exhibit for the World's Fair at Paris in 1878, I naturally, from this experience, have some ideas which may be turned to account for the coming Chicago World's Fair. To begin with, at the start there is always a great hurrah—there is plenty of money and plenty of help, until the money is wanted and the help means work. Then there is a general weakening all around. This fact we experienced; and when I say we, I mean the parties above named (including your humble servant) who did the work and made the success as far as the collection went; and even then all would have been a failure but for the generosity of John W. Mackay, who came forward with a check for \$5000—yes, \$5000.

"The point I am now aiming at is, if the mining counties do not take the matter of an exhibit in hand (each mining county for itself), the work will be but meagerly done and there will be general dissatisfaction."

"Now my proposition would be this: Let the representative mining men of each county organize World's Fair Committees, for the exposition of the mineral wealth of its respective county, and have no affiliation with any other industry. These County Committees can then form by representation a State Committee, who would see to the general business, as appropriation, etc., and see that the mining interest had its due (which it has not had for some years). Unless this is done, the mining interest will be left in the background. As to mining machinery, that can be passed over to the manufacturing interest, or be a matter for the State Committee."

"Another point I have to suggest is that where donations of minerals are made, there should be an understanding that the entire collection, at the end of the fair, be donated to the city of Chicago, they agreeing to place the collection on permanent exhibition in their public library or as they might see fit. By so doing, every county would be benefited for years after the fair was over."

"We certainly want to show, in profusion, the great value of the mining localities for every class of mineral—iron as well as gold, lead as well as silver. The fact of it is, Californians as a body do not clearly comprehend the value of our mineral wealth outside of gold, and we want to show it all. There is enough to do in this especial department without mixing it up with fruits, grains, pumpkins or potatoes. A State Mining Committee, having control of the entire exhibit, could command the situation and make a success of great value to the mining industry."

May, 1890.

ALMARIN B. PAUL.

"The Otay watch factory turned out its first assortment of time-pieces last Saturday. The event was celebrated by a free excursion to and from San Diego and a big banquet."

MINING SUMMARY.

The following is mostly condensed from journals published to the interior, in proximity to the mines mentioned.

CALIFORNIA.

El Dorado.

PROSPECTING FOR GRAVEL.—El Dorado *Republican*, May 31: Steps have been taken during the last week to prospect the extensive gravel ridge east of Placerville, a large part of which is owned by the Blair Brothers. This lava-capped ridge is known to contain in many places large deposits of auriferous gravel, which is probably the continuation of the old river channel which passes through Coon Hollow, Prospect Flat and Smith's Flat, and which has been very rich in many places. The Blair owns a tract $5\frac{1}{4}$ miles long on this ridge and the property has been bonded by a company which have made arrangements to prospect it by boring vertical holes through the cap on the ridge down to the gravel and bedrock underneath, which will require borings of 150 feet and upward in each instance. A. L. Perkins is in charge of the boring. The machinery to run the drills was sent up the ridge last Saturday, and it will soon be in operation by water-power from the El Dorado Canal. The first boring will be on the Painter Ranch. Considerable work has been done on the ridge by running tunnels and inclines without satisfactory results, as the gravel deposit is of unknown depth and extent, and not easily prospected in that way. The object of the boring is to ascertain the deepest parts of the channel and where gravel can be found, so that tunnels can afterward be run so as to drain the ground and develop it at once without the costly mistakes that have so often been made in other deep gravel mines by getting the opening tunnels too high. The borings will be four inches in diameter and will show the exact nature and depth of all the material on the ridge down to the bedrock.

Mariposa.

WHITLOCK MINES.—*News*, May 31: P. H. Breen's new find still shows good prospects and the discoverer thinks he has struck a valuable mine. Two young men by the name of Reed, from Coulterville, have opened up an extension on the Bull Dog lode and have a vein about three feet thick, which shows good milling ore. Work is progressing on the Grove & Ellingham mill. The battery frame is up, and the engine, rock-breaker and self-feeder in place. The water-tanks are in course of construction and the probability is that the mill will be completed inside of six weeks.

Nevada.

GOLD HILL MINE.—*Grass Valley Union*, May 30: The quiet that has so long reigned about the premises of the old Gold Hill mine has been changed to a scene of busy activity, preparatory to a resumption of underground work. Already a comfortable two-roomed building has been put up to be used as an office and storeroom, and necessary repairs to the hoisting and pumping works buildings are well under way. The position of the machinery is being changed for more convenience, and, where necessary, new bed-logs are being placed under the engines and hoisting gear. The carpenter work is being done by I. T. Walker, and James Burke is the mining foreman, having general supervision. No effort will be made to open the incline shaft until steam can be started up, which will take several weeks yet, as there is a good deal of surface work to be done before undertaking to open the shaft. The Gold Hill mine is historical, as upon that hill was the first discovery of gold quartz in California, and where the first regular quartz mining was instituted. Several millions of gold were taken out at that locality first and last, but the mine became apparently barren when it was worked to a depth of 350 feet, and for over 10 years it has been standing idle. Experience has shown that it will not do to say that a quartz mine has been worked out in this district when no greater depth than that has been reached, as such mining as that is but superficial. Deep working has given the best results, and the new company that has purchased the Gold Hill mine will exploit the property on that theory.

PEABODY.—The water is nearly out of the Peabody mine, and a track is being constructed for a dump, in readiness for the underground work which will soon commence.

Shasta.

IGO.—*Shasta Democrat*, May 28: Whit George and Doc Dunham of Igo came in Monday from their mine on Muleton mountain, bringing with them a large sample of ore from the mine. They have developed this mine sufficiently to prove that it is a valuable piece of property. The ore is very heavy in sulphurets and when concentrated assays about \$500 a ton. They have been working some of the ore in a small arrastra and amalgamate about \$50 a ton.

LOWER SPRINGS.—*Cor. Democrat*, May 28: The Beecher property is fast coming to the front. Their tunnel is advanced in the mountain, running west about 240 feet, and have had good ore from the point of tapping the ledge. I learn from good authority that the breast of their tunnel running west is in far better ore than yet discovered in any part of their mine. They have also commenced an upraise to connect with the shaft so as to afford them abundance of air. This mine has good ore in every place of working, and we congratulate them for their energy and hope they will be rewarded double fold for labor. The St. Auburn, Ed Sweeney's mine on Clear creek, is fast becoming a valuable piece of property. I was informed by Peal & Rice, part owners, that their prospect is way up, the best they know of. The Mountain View M. Co. is still advancing their tunnel toward the old shaft where there is still considerable good ore in sight and they intend to run a tunnel still beyond the shaft toward the summit of the hill, where they expect crosscutting for other valuable ledges. The Walton mine on Salt creek is going to start up soon. Jim Hill is bent on starting a tunnel on Salt creek and run west in order to tap the Keystone mine, which is so well known for its ore produced. There is some talk of the Deakin & Taylor group of mines starting up. This is the best piece of mining property in this district and ought not to lie idle.

Sierra.

RIVER CLAIM.—*Mountain Messenger*, May 31: Oscar Jones has gone to work about five miles up the North Fork, to open the river claim of P. Lorenson,

There is supposed to be quite a stretch of the old river channel there which was covered by a slide, which has never been worked owing to its being below drainage.

LONE STAR.—Mr. Snyder, of the Lone Star mine, has sent up men to prepare for operating this summer after the snow has melted around Gold Valley. **THE MOUNTAIN MINE.**—*Tribune*, May 30: Richard Harper arrived here yesterday from S. F., accompanied by Mr. Hancock of London. Work will be commenced at the Mountain mine just as soon as practicable under the able management of Mr. Harper. Mr. Hancock will have charge of the accounts, pay department, etc.

Trinity.

TRINITY CENTER.—*Shasta Democrat*, May 28: Gerald O'Shea of Trinity Center arrived in town Sunday evening via Lewiston, bringing with him some handsome specimens of free gold croppings from the new gold mines northeast of the Altona quicksilver mines. He says there is plenty more yet on the mountain ranges in the northern part of Trinity.

HYDRAULIC MINES.—Louis Raab of Douglas City reports his section of Trinity county prosperous—particularly the hydraulic miners. They will make the biggest cleanup this season that they have made in years; the result of plenty of water, which insures a long season's work. The new mining camp on Canyon creek is booming and is alive with hardy prospectors. Several new and valuable mines were discovered in the new camp within the past six months, which have attracted a great number of miners to the new district. The quartz there is rich in free gold and the veins average good size.

A NEW STRIKE.—*Weaverville Journal*, May 31: T. J. Blakemore was in town this week and informs us that Harvey Springsted discovered a new ledge last March on the Daisy mine location above Lewiston. The ledge averages about two feet in width, carries free gold and prospects well. It is good milling rock. The ledge shows up well for the amount of work done upon it and Mr. Blakemore, who is interested in it, thinks it will prove a good thing.

HETTENSCHAW QUARTZ.—There is some prospect of Hettenschaw's becoming a quartz camp. Mr. Willburn informs us that eight men have been put to work in developing the ledge found last year on Big Rock creek, and that more men are wanted. The ledge is within four miles of Hettenschaw valley and has been traced for eight miles. The parties who have charge of the mine are moneyed men and intend working the ledge for everything there is in it this season.

DEADWOOD.—The past two weeks of warm weather is shortening our supply of water to prospect on the high ridges. There have been no big strikes in camp of late, although we hear that Kline & Co. have a very flattering prospect on the Bismarck mine which we hope may increase as the development goes on. Manuel Enos & Co. are getting a very good prospect on the Wm. Lappin claim. Every one seems to be getting over the effects of the hard winter and doing better than ever.

Tuolumne.

HYDE MINE.—*Sonora Democrat*, May 30: Jack Hammond, the efficient engineer of the Hyde mine, started up the pumps on that mine Tuesday. Work will now be vigorously prosecuted.

BLACK OAK MINE.—The pumps on this mine are in active operation, and other necessary preparations are being made for the future working of the mine. As soon as the mine is freed from water, a large force of men will be put on, and the stamps will sing merrily, as before, crushing high-grade ore.

THE CARRA MINE.—This mine, situated near Soulsbyville, between the Live Oak and Black Oak mines, is looking well. Mr. A. F. Cooper, the owner, is making rapid developments on the mine, which is on the same lode as the Black Oak. The ore yields \$30 per ton in free gold and over \$500 per ton in sulphurets.

SAN GUISeppe.—This mine is being thoroughly prospected—something never done before—under the able management of Supt. Whorf, and will be in a well-developed state before long. The parties having the mine at present will make every examination possible into the merits and demerits of the property before completing the purchase thereof. The vein is now 10 inches in diameter, and has been varying between 10 and 14 inches for the past three months. The similarity between the ore of this mine and that of the Golden Gate is so great that no difference can be noticed when placed side by side, yet the ore from the Guiseppe contains three times as much gold as that from the Golden Gate. The sulphurets are fabulously rich, and are treated at the Malmgren Reduction Works. Eight men are employed in the mine.

NEVADA.

Washoe District.

ORE AND BULLION YIELD.—*Virginia Chronicle*, May 31: This week's ore yield of Comstock mines aggregated 6485 tons, divided as follows: Con. Cal. & Va., 2407 tons, assay value \$23.25 per ton; Savage, 505 tons, assay value \$22 per ton; Hale & Norcross, 1125 tons, assay value \$18.50; Yellow Jacket, 570 tons, assay value \$21; Crown Point, 610 tons, assay value \$22; Justice, 200 tons, assay value \$27.13; Alta, 350 tons, assay value \$22.75; Overman, 260 tons, assay value \$23.75; Chollar, 449 tons, assay value \$21.32. Following was the bullion yield of the ore product from each of the above mines, estimated on the probability that 80 per cent of the value of battery sample ore pulp assays was returned: Con. Cal. & Va., \$45,000; Savage, \$8888; Hale & Norcross, \$17,000; Chollar, \$9563; Yellow Jacket, \$9600; Crown Point, \$17,000; Overman, \$4850; Alta, \$6200; Justice, \$4200; total, \$176,301.

SIERRA NEVADA.—On the 630 level a southwest drift is advanced 665 feet from the shaft station and is discontinued. At a point in this drift 600 feet from the shaft station, a west crosscut is advanced 47 feet, the face in porphyry.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is advanced 422 feet. Repairs to the north lateral drift in progress.

MEXICAN.—On the 1465 level at a point 70 feet south from west crosscut No. 4, west crosscut No. 5 is advanced 75 feet in porphyry carrying quartz showing value.

OPHIR.—On the 1300 level in drifting southwest from the top of the raise carried up 28 feet

above the south drift from the end of the east crosscut from the shaft station, the ore streak followed in that direction has changed into quartz of low value.

CON. CALIFORNIA & VIRGINIA.—The 1300 and 1500 levels continue to yield the usual quantity of ore. Shipped to the Morgan mill 1092 tons of ore and to the Eureka 1419 tons; battery sample assays showing an average value of \$23.25 per ton; 2407 tons milled. Bullion valued at \$13,106.73 shipped to the Carson Mint, and about \$62,000 on hand in local assay office.

SCORPION.—The southwest drift from the 630 level shaft station is advanced 610 feet and continues in porphyry.

ANDES.—A 420 level west crosscut 160 feet north of the shaft is in 42 feet. The face is in low-grade quartz. The 350 level west crosscut is extended 245 feet, the face still in porphyry.

SAVAGE.—Shipped 505 tons of ore, showing an average value of \$22 by battery sample assays. Nothing new in 300 level explorations.

HALE & NORCROSS.—A 1300 level north line east crosscut is in 45 feet, showing porphyry and low-grade quartz. Shipped 1125 tons of ore during the week, showing an average value of \$18.50 per ton by battery sample assays.

WARD COMBINATION SHAFT.—The 1800 level, east drift is out 395 feet; the face continues in porphyry.

CHOLLAR.—Extracted 449 tons of ore, battery sample assays showing a value of \$21.32 per ton.

POTOSI.—On the 930 level the winze is down 134 feet, the bottom principally in quartz giving low assays. Sinking the winze is suspended pending the setting up of a hoist plant at the top.

ALPHA.—The 600 level west crosscut is in 165 feet, the face in quartz.

EXCHEQUER.—The 500 level north line east crosscut is in 210 feet, and continues in quartz and porphyry.

CON. NEW YORK.—The north drift from the top of the raise above the 800 level is out 35 feet, the face in low-grade quartz.

SILVER HILL.—The east drift from the winze below the 800 level is out 75 feet, the face showing bunches of fair-grade quartz.

IMPERIAL.—The joint Challenge-Confidence 1000 level north drift is out 222 feet from the north line of the South Challenge, the face in porphyry. The 750 level west crosscut No. 3 is in 145 feet, the face in quartz and porphyry.

YELLOW JACKET.—Shipped 570 tons of ore showing average assay value of \$21 by battery sample assays.

CROWN POINT.—Shipped during the week 610 tons of ore, showing an average value of \$20.52 per ton by pulp assays. A west drift from the 400 level raise is out 52 feet. Ore shipments suspended on account of high water in the Carson river flooding the mills.

CONFIDENCE & CHALLENGE.—The joint Imperial 1000 level west crosscut No. 2 is in 266 feet, the face in vein matter and the bottom in ore. The joint Imperial raise above the 700 level north drift is in low-grade quartz. West crosscut No. 2, same level, is in 103 feet; the face continues in low-grade quartz.

BELCHER.—The 200 level west crosscut has reached the west wall. Have started a north drift following the vein. The 850 level joint east crosscut is out 483 feet, the face still in soft porphyry and clay. A 200 level west crosscut No. 3 is being advanced to cut the continuation of the Crown Point 300 level stop. The 1300 level east crosscut is in 30 feet in low-grade quartz.

SEG. BELCHER.—The 800 level west crosscut is in 45 feet, the face in porphyry and quartz.

JUSTICE.—During the week crushed 200 tons of ore showing a value of \$27.13 per ton by battery sample assays. The raise above the 622 level continues in low-grade quartz. The bottom of the winze below this level is still in good ore.

ALTA.—The ore output this week was 350 tons, showing an average assay value of \$22.75 per ton by pulp assays.

OVERMAN.—Shipped 260 tons of ore during the week, showing an average value of \$23.25 per ton by battery sample assays. The northwest drift continues in low-grade quartz. The incline winze is down 46 feet below the 1200 level, ore still showing in the bottom.

UTAH.—On the 725 level west drift is advanced 252 feet from the shaft. At a point 225 feet west of the shaft a south drift is advanced 80 feet, the face in vein porphyry and quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels. In the 550 level north line west crosscut the winze is down 27 feet, the bottom showing bunches of good ore. The 550 level north line crosscut has been stopped until better ventilation is secured. The 650 level main north drift is extended 106 feet, showing low-grade quartz.

NORTH OCCIDENTAL.—Work confined to repairs.

BEST & BELCHER.—On the 1200 level, at a point in the north drift 410 feet from the shaft, west crosscut No. 2 is cleaned out and repaired 20 feet.

GOULD & CURRY.—On the 200 level the south drift from west crosscut No. 1 is extended 85 feet. Formation, porphyry with streaks of quartz.

Eureka District.

A NEW MINING DEAL.—*Sentinel*, May 31: An arrangement is pending between Prospect Mountain Tunnel Co., and the owners of the Silver Connor mine to connect the mine with the tunnel. The tunnel has an upraise in the direction of the Silver Connor several hundred feet in length. From the head of this upraise to the lowest workings of the Silver Connor mine is a distance of 350 feet. The running of this 350 feet is all that has to be done to give the mine the advantage of working through the tunnel. It is thought that an arrangement can be perfected at an early day whereby the two properties will be mutually advantageous to each other. If a satisfactory consolidation of the two properties cannot be brought about, then an understanding on the basis of a royalty for the use of the tunnel is believed to be practicable. In any event the parties are earnestly negotiating, and it is more than probable that an agreement will be speedily reached. The Silver Connor, which is already a mine of established value, can be worked to a depth of 1200 feet through the tunnel. With the pending deal consummated, another good and paying property of very considerable magnitude will be added to our list of bullion producers.

ORE SHIPMENTS.—There were 555 tons of ore shipped over the E. & P. railroad during the week.

During this month the shipments to Salt Lake have aggregated 2000 tons.

Freiburg District.

PROSPECTS.—White Pine *News*, May 31: P. N. Hansen, who has been out at Freiburg for the past two years developing the mines of that district, was in town several days this week. Freiburg is about 125 miles south of here, and was prospected and worked years ago by C. C. Goodwin, now of the Salt Lake *Tribune*. The surveys of the western extension of the Union Pacific railroad run within one mile of the mines, and when the road reaches there, Freiburg is sure to become one of the most prosperous mining camps in the State. While the ores are mostly low grade, the deposits are large and contain just the necessary fluxes for smelting. The ores are carbonate found in porphyry between quartz and limestone, and average from 30 to 50 ounces in silver per ton and 40 to 50 per cent in lead. There is now on the dumps from the several mines from 1500 to 1800 tons of ore that will average the figures stated, besides any quantity of the same kind in sight ready for extraction. George Ernst of Belmont has also some promising mines there, the richest being the Shonti, which goes from 200 to 800 ounces in silver and 40 per cent in lead. Considerable ore has been shipped from this mine. Though the country is generally very dry, Mr. Hansen tells us he ran a tunnel this winter 300 feet in porphyry and got a fine stream of water, sufficient for all the needs of the camp.

Pioche District.

THE YUBA.—*Pioche Record*, May 28: Having been tendered an invitation by Supt. Sam Godbe to visit the underground workings of the Yuba, we repaired to the tunnel level of the mine, some 300 feet from the surface, and accompanied our guide some 60 feet east of the shaft, until the flickering rays of our candles brought to view 4 feet 2 inches, actual measurement, of ore, that we were informed averaged 60 oz. silver, 25 per cent lead and $\frac{1}{4}$ oz. gold. From our knowledge of the general characteristics of the Yuba ore, we have no reason to doubt the authenticity of the figures. Having satisfied our curiosity in regard to the 8th level, we dropped down to the 830 where the ledge is smaller, but richer, 2 feet of ore being in sight that averages 300 oz. in silver and 50 per cent lead. The ore at this point is clean, having a dark glossy appearance which resembles black metal. We next visited the 9th level where the ore has undergone a change, it being free-milling quartz, the ledge being 5 feet between walls. Mr. Lloyd places the average of this ore at 50 oz. per ton. From the 9th to the 10th levels we noticed another change in the character of the ore body, the ledge the greater part of the distance being 10 feet in width, the ore being zinc blende and galena that assays from 30 to 80 oz. per ton and carries 25 per cent lead. From the 10th to the 11th the same character of ore is encountered, the ledge, however, being smaller, 4 feet being about an average. We examined the ledge at our leisure between the 11th and 12th levels, where considerable work has been done, and found it to average 4 feet, more than half of it being free smelting, and the remainder good concentrating ore. The clean smelting ore averages 130 oz. silver and 50 per cent lead, and the concentrating 25 oz. in silver and 20 per cent lead. We next visited the 13th level, which is the deepest point in the mine, and from where a prospecting drift of 110 feet has been completed to cut the ledge; the vein matter when uncovered at this point did not show much, but after drifting 25 feet the same chimney of free smelting ore that is exposed on the 12th was encountered, average samples from 2 feet assaying 100 oz. silver and 30 per cent lead. At this writing the hanging-wall has not been reached at this point.

ARIZONA.

JOHNNIE BULL.—*Tomahstone Prospector*, May 28: William Henry of Stein's Pass made a very rich strike last week in the Johnnie Bull mine, which he has been working. At a depth of 264 feet a blind ledge was encountered running at right angles to the copper vein on which he was sinking. The ledge is five feet wide, and is what is known as sand carbonates. An average of the ore was taken to N. W. York by Mr. Henry, who wrote back to a friend that the ore would go 82 ounces silver and carried 40 per cent lead. Mr. Henry is backed by ample capital, and will erect extensive concentrating works between the mine and Galeville. The latter point is but 12 miles from the Johnnie Bull, and there is an abundance of water between the two points. G. H. Montgomery of the Chiricahua mountains, whose ranch and mining interests are below Galeville, is in town and reports some activity in mining matters in that locality. A New York company is working the Texas mine, and on the 17th of the present month struck the ledge in the face of a tunnel at a depth of 250 feet. They are into the ledge over ten feet, and there is no sign of the hanging-wall as yet. Mr. Miller of the Rhode Island Co. is working a small number of men and is taking out good ore.

SILVER.—*Silver Belt*, May 26: The total bullion shipments by the Fame Silver Mining Co., from ore recently worked at the Centennial mill, were 15 bars weighing 1785 pounds or about 26,000 ounces. The Fame is maintaining its reputation as one of the best silver mines in Arizona.

COLORADO.

STRIKE IN THE O. K.—*Aspen Times*, May 29: Manager C. W. Ellis of the O. K., is just now highly pleased over a new discovery in that property. The O. K. has been a producer of small quantities of ore for a long time, but until within a few days, nothing has been found that looks like a big strike. Now, however, there is a face of ore showing that promises to make the property a payer of large dividends. Mr. Ellis has been at work for some time and has just opened what appears to be a continuation of the main ore-chute of the Dollar. He finds it at a point that is a little above and some 40 or 50 feet south of the drift that reaches across the Dollar, connecting the O. K. with the Justice incline. He is running a level that is about 10 feet east of his west side line, and in this he struck ore a few days ago. It had opened out Monday until it was shown to be six or seven feet thick. A portion of it ran over 100 ounces per ton and all averaged up close to 60 ounces. He has every reason to believe that

this will prove to be one of the big strikes of the Park, as the ore-chute has been followed far enough in the Dollar to show that it is continuous and that it is probably as rich where it crosses into the O. K. as where it has been developed.

COKE OVENS.—Elk Mountain *Pilot*, May 28: Work will be commenced at once on the erection of 30 new coke ovens by the C. G. & I. Co., in this town. General Supt. S. S. Ramsey was here yesterday, accompanied by his wife, J. J. Rickard of Greensburg, Pa., who will have the contract to build the ovens, was also here looking over the ground. Also in the party were A. C. Weimer, S. G. Rickard and J. D. Best, all old friends of Mr. Ramsey from Greensburg, Pa.

BRITISH COLUMBIA.

GOOD NEWS FOR MINERS.—Kamloops *Sentinel*, May 31: We are glad to learn that the Provincial Government has made arrangements by which the payment of \$105 required on the location of a mineral claim within the railway belt, will not be exacted until after the locatee shall have proved his lodge and applied for his crown grant. This removes a serious obstacle in the way of prospecting within that Territory. The question was agitating the public mind while the Premier was visiting Kootenay last week, and was the principal subject of discussion. The prompt action of the Government in having the grievance complained of removed will be fully appreciated by the miners.

DAKOTA.

IRON HILL.—Deadwood *Pioneer*, May 31: Two wagons heavily laden with silver bullion came in from the Iron Hill smelter yesterday, and unloaded at the First National bank. There is now at the bank 288 bars, weighing about 13 tons. Several tons have already been hauled to Whitewood and several hundred bars are still at the smelter, which is still in blast.

IDAHO.

STRIKE.—Idaho *World*, May 31: A rich strike has been made in the Pride of Idaho mine, about one-fourth of a mile above the Elkhorn. Hugh Turner a few years ago made a big cleanup from ore from this mine, and if the rich ore continues coming out as rapidly as it is now, some big cleanups will be made this year. There are several very rich mines in the Elkhorn district that should have mills on them; but as most of them are in the hands of prospectors, we cannot expect to see new mills go up until the money is made out of the mines or they pass into the hands of men with sufficient means to go ahead and not be afraid to push work. Three or four of them are now owned by a Boston company that seems to be waiting for them to take fresh root and grow.

A TUNNEL SCHEME.—Silver City *Avalanche*, May 31: Since the early days of this camp, the idea has been advanced that a tunnel commencing in the south branch of Sinker creek, about one mile east of War Eagle mountain, and run in a northwesterly direction, would strike the mines of that mountain at a depth of about 1500 feet. It is now proposed to do this. The tunnel will be commenced at a point in South Sinker, a mile due southeast of the Minnesota mine, and will be run that distance in a northwest direction. It will be seven feet high and six feet wide in the clear, with a drain race in the bottom four feet wide and three feet deep. The tunnel will be run with Burleigh drills, with electric-power, which will be supplied by a very large dynamo, run by water-power part of the year and by steam-power the balance of the time. It is also intended to supply Silver City with lights, by wire run from the dynamo to town. It is estimated that the tunnel can be run to cut War Eagle mountain at the depth mentioned for about \$155,000, but to make success doubly sure, a working capital of \$225,000 will be raised, which it is thought will extend the tunnel still farther into the mountain than is now contemplated to do. It is expected that the tunnel will be completed within two years at most. The object of prosecuting this enterprise is to work the lodes already discovered, and to find new ones. When the lodes on the Oro Fino line shall have been cut, drifts will be commenced by the owners of those mines, ore extracted and run into a large mill, which will be erected near the mouth of the tunnel, and for the erection of which capital will be raised, and the mill erected by the time the lodes are cut. This mill will be erected below the tunnel about 300 feet, and will be run the year round by water from the south fork of Sinker creek, and the four-foot drain in the tunnel, by means of Pelton wheels. The estimated amount of ore expected to be milled before the lode first cut is exhausted is about 2,000,000 tons. The tunnel company will charge for running the ore out of the tunnel to the mill, a royalty of \$2 per ton, so that the ore will cost the owners of the mines above mentioned that price for delivery at the mill. The company will then pay all wear and tear of machinery in working the same. Of course the mine-owners will have to mine the ores, so that the tunnel company will be at no expense other than running the ore to the mill. By this manner of mining it is thought that the mine-owners will mine and mill their ores at a cost of not more than \$7 per ton, which will leave them a very handsome profit.

QUARTZ.—*Avalanche*, May 30: The discovery of a quartz lode was made by Mr. J. F. Sullivan during the week nearly a mile beyond the summit of Long Gulch, which looks well. He has not yet had time to prospect the lode, but so far as developed it is about six feet wide. This is a new district or section in which no lodes have been heretofore found and may lead to the discovery of other lodes of great value.

PLACERS.—It is rumored around town that rich placer diggings have been found in the immediate vicinity of Quicksilver mountain in this county. That gold has been found in that section there can be little doubt, as in the early days of this camp some was washed out. Whether there are any extensive gold fields so near home is a question yet to be determined, but from our knowledge of the country, gained from old prospectors, we are inclined to say no.

BLACK JACK.—Supt. E. H. Dewey informs us that the crosscut to cut the Black Jack and Empire State mines is in very hard ground, but that he hopes soon to have the air compressor in, when better

headway will be made. He has had a good wagon-road constructed on the hillside up Blue gulch to the tunnel, over which all supplies will be hauled to the crosscut or tunnel.

LOWER CALIFORNIA.

SAN DAVID.—The original location on this vein showed a heavy outcrop of low-grade ore. Recently a parallel vein was struck which has given the claim great value. The new discovery has been opened on the croppings for 200 feet, to a depth of 12 feet, and 150 tons of ore extracted that pays not less than \$20 per ton. Unfortunately, like other good veins, it is hindered from sinking deeper by water unless sufficient pumping capacity is provided. About twenty men are at work stripping the ledge and sinking shafts. The vein for its full length will average twenty inches wide.

TELEMACO.—The shaft, 65 feet deep, is on the 70 degree incline of the ledge, dipping south. The mine has shown a bold outcrop, having ore in places eight feet thick. It will average four feet thick for 100 feet in length. The ore is laminated in character, showing a large amount of oxide of iron and free gold, and very rich decomposed quartz in seams. Supt. Rodda is now at work putting up a substantial hoisting works and steam pump to drain the mine.

PENLOPE.—A contract for sinking an almost vertical shaft of 70 feet was completed last week. A crosscut in the bottom shows a ledge four feet thick. By far the greater part of custom ore in camp is milled by Col. Lane. His mill was repaired and started running on the 9th, and for the week ending the 16th Col. Lane reports the amount of custom ore worked as 69 tons, 718 pounds, yielding 148 oz., 9 dwt. of retorted gold, valued at \$2069. This makes an average of over \$42 per ton. The ten-stamp El Paso mill is kept running night and day on Elsinore rock. The Torres Co. has been reorganized under the name of the Santa Clara Mining and Milling Co., composed of Messrs. H. M. Russell, Thos. Rhodes and H. Edwin Moore. Their five-stamp mill will be started next week. All the mines being worked by private parties and smaller companies are doing well and lots of gold is being taken out.

ALAMO.—Cor. *Lower Californian*, May 29: Directly and indirectly the Princessa and Colonization Companies have 150 men in their employ, almost half of whom are tributaries, who seem satisfied with the conditions of contracts and leases, and are making money. The company's mill is Huntington's patent centrifugal, working 14 tons per day. On this class of ore the mill does very good work and is kept steadily running, although the ore is now charged with sulphurets; and I should think it advisable to concentrate the sulphurets now being piled in tailings. The Princessa Co., Limited, incorporated with eight mines—the Princessa, Cocino, Ulises, San David, Gragdisima, Moran, Iron Mask and Spider. The principal ones worked are the Princessa, Ulises and San David. Assessment work only has been done on the rest. The Colonization Co. is working nine mines, of which the Telemaco and Penelope are chief. The others are merely prospects.

ULISES.—The shaft is 100 feet deep, and a crosscut was started in the bottom, but had not struck the ledge in December, when the overflow of water overcame the steam pump. The company now proposes to erect powerful machinery on this shaft, the largest steam pump in camp being now on the ground. The vein at the bottom of the Indian shaft is one foot thick in well-defined walls and pays \$50 per ton.

MONTANA.

BOULDER NOTES.—*Age*, May 31: Another rich strike is reported in the Hiawatha mine, Cataract district. A carload of ore from the Mollie McGreggor mine went to Helena the past week by the Northern Pacific road. Messrs. Hight, Fairfield & Honaker are taking up the bond on the Obelisk mine of Jo McNally, near Basin. Eight bars of Holter bullion came down from Elkhorn the past week for shipment East by the Northern Pacific Express Co. Mining properties in the Amazon district continue to improve and there is every probability that the district will shortly become one of the most noted in the country.

NEW MEXICO.

CONCENTRATES.—*Western Liberal*, May 28: The Standard Mutual shipped a carload of ore and a carload of concentrates to the O. Ford Copper Co. of New York this week. J. W. Hughes of St. Louis was in town Monday en route from Clifton to Gila Bend. Mr. Hughes was in Clifton to expert the Ingram group of mines in Gold gulch, on which he has bond which has about 4½ months to run. Mr. Hughes is very much pleased with the looks of the property and thinks he will have a rare bargain.

OREGON.

RICH GOLD SPECIMENS.—Bedrock *Democrat*, May 22: At the First National Bank Cashier Parker has placed on exhibition a display of gold product specimens of rare beauty and richness, the product of the mines of Baker county. Here will be seen numerous specimens from the Virginia mine of Robinsonville, 40 miles southeast of the city, the richest discovery of gold ore ever found in the Northwest. From this mine with a hand mortar alone upward of \$10,000 has been taken out. Specimens from the famous Connor Creek mines are also to be seen, and last but not least the gold nugget of the value of \$420 picked up on May 13th in the Boreman placers eight miles east of the city, attracts the eye of all lovers of the beautiful.

UTAH.

THE SOLID MULDOON.—Eureka *Chief*, May 30: Some nice-looking quartz from the bottom of the Solid Muldoon shaft was hoisted Tuesday. It will probably assay way up. Col. T. P. Murray of the Murray Hill Mining Co., which has a bond on this and other claims, the property of Capt. H. D. prezin, came down Monday, and is jubilant over the appearance of the prospect. He took some of the quartz in to the city for assay. The shaft is being sunk rapidly, and the operators feel confident that they are very close to a large body of ore.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 27, 1890.

- 428,730.—WINDOW VENTILATOR—P. Abrahamson, S. F.
428,587.—HYDROCARBON BURNER—Avery & Smith, San Diego, Cal.
428,588.—TIME-PIECE DIAL—W. W. Bartram, Portland, Me.
428,829.—HYDRAULIC MOTOR—H. P. Christiansen, Oakland, Cal.
428,898.—BRIDLE—G. T. Duncan, Tacoma, Wash.
429,026.—CAR-COUPLING—F. A. Fox, S. F.
428,673.—CANDLESTICK—Gavin & Cromer, Eureka, Cal.
428,750.—COIN ACTUATED ATTACHMENT FOR PHONOGRAPHS—Glass & Arnold, S. F.
428,751.—COIN ACTUATED ATTACHMENT FOR PHONOGRAPHS—Glass & Arnold, S. F.
428,840.—CRATE—G. T. Hall, Monrovia, Cal.
428,777.—GATE—F. J. Johnston, Sacramento, Cal.
428,757.—RAILWAY RAIL JOINT—Jos. P. Kelly, S. F.
428,733.—SPIKE-MAKING MECHANISM—S. Uren, Sacramento, Cal.
428,986.—OVERFLOW SLOP-HOPPER—E. W. Williams, S. F.
428,708.—SPREADER FOR DRAFT CHAINS—S. P. & E. Windsor, Madison, Cal.

The following brief list by telegraph, for June 3, will appear more complete on receipt of mail advices:

California—Percy Beaulieu, S. F., carpet-fastener; Henry A. Bond, Los Angeles, turfed head rest; Joseph Davy, Oakland, and J. T. Dufan, S. F., box-fastener; George E. Day and E. H. Cole, S. F., wave-force pump; Charles N. Earl, Los Angeles, sand-box for water conduits; Charles W. Elkins, Palermo, and W. C. and S. Foreman, Hildwell's Bar, fruit-pitting machine; James I. Kingeard, S. F., portable windlass; Joel B. Low, S. F., railway car; Willard F. Nightingale, Latrobe, axle set; Owen T. Owens, S. F., assignor to Benilda Agricultural Works, Benilda, draft and haul gauge for plows; Lucinda M. Piersan, Goleta, remedy for ulcers; Mary E. Thraut, Riverside, clo-hespin; Andrew S. Wadleigh, S. F., can-head cutter. Washington—Nels Nelson, assignor of one-half to J. J. Weatherway, Aberdeen, snap-hook. Oregon—Benjamin F. Fuller, McMinnville, clothes-drier.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast, inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SPIKE-MAKING MECHANISM.—Stephen Uren, Sacramento. No. 428,733. Dated May 27, 1890. This invention relates to that class of spike-making machinery in which the bar is clamped sidewise, resting upon a suitable die, and its tapering point is made by the action of a small wheel or roller which hears down upon it. The invention is properly an attachment to a bolt-heading machine, as it has been adapted to be applied readily to such a machine, using the power-transmitting devices and operative parts, such as the frame and plunger and gage of said machine, to effect similar operations in connection with the operations of the spike-making attachment. The subject of spike-making has lately received more consideration, and attention has been more particularly directed to making a proper tapering point which will adapt the spike to enter the wood and hold better without breaking the fiber—a point which is of greater importance than formerly by reason of the use of softer wood for ties as material becomes scarcer. The main object of this invention is to form a perfect point to the spike, thus insuring its best use and results.

RAILWAY RAIL JOINT.—Joseph P. Kelly, S. F. No. 428,757. Dated May 27, 1890. This invention relates to that class of railway rail joints in which the end of one rail is fitted directly into the end of the other rail. The invention consists in the novel construction of the adjacent ends or terminals of the rails. The object of the invention is to provide a simple and effective joint for rails which will avoid the use of the ordinary fish-plates, and which will make a practically continuous rail.

WINDOW VENTILATOR.—Peter Abrahamson, S. F. No. 428,739. Dated May 27, 1890. This patent relates both to the general class of ventilators and to that particular class which is exemplified by a patent issued to the same inventor Jan. 11, 1888, and in which two separate plates or sheets are so arranged in a frame as to leave a passage between them which communicates at the bottom with one side and at the top with the other side. The object of this invention is to provide an adjustable ventilator which a purchaser can obtain without special measurement of his window-casing, and which can be made to adjustably fit any window-casing, adapted to be readily inserted and as readily removed when not required. Another object is to provide for protecting the opening between the meeting rails of the sashes when separated.

COIN-ACTUATED ATTACHMENT FOR PHONOGRAPHS.—Louis Glass and Wm. S. Arnold, S. F., assignors to R. W. Smith, No. 428,750. Dated May 27, 1890. This invention relates generally to the class of devices designed

to be operated by a suitable coin deposited properly, and especially to an attachment of this class intended to be operated in connection with a phonograph. The object of the invention is to provide a suitable device by which the phonograph may be exhibited and heard by any one upon the deposit of a suitable coin.

COIN-ACTUATING ATTACHMENT FOR PHONOGRAPHS.—Louis Glass and Wm. S. Arnold, S. F., assignors to R. W. Smith, No. 428,751. Dated May 27, 1890. This device belongs to the same class as the preceding, and differs from it only in the construction and arrangement of parts, by which the deposited coin is enabled to act the phonograph in operation and open the communication between the spectacle of the phonograph and the hearing tubes.

The Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

§Bullion at Mint, \$11,080—mine expenses not taken out.

||Collecting assessment—month's mine expenses and bullion out, not included.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

AMADOR CANAL AND IMPROVEMENT CO., June 2. Capital stock, \$100,000. Directors—W. A. Keeper, F. P. Bull, John C. Quinn, W. H. Davis and C. E. Parks.

OAKDALE LAND AND IMPROVEMENT CO., June 2. Capital stock, \$500,000. Directors—Mendel Esberg, A. Roos, M. J. Newmark, E. Ettinger, J. Ettinger, N. S. Harrold, Louis Kahn, D. S. Rosenbaum and Geo. S. Sperry.

ETHEL TICKET-REGISTERING PUNCH CO., June 2. Capital stock, \$100,000. Directors—E. E. Etzel, T. M. Sweet, J. W. Dermody, W. D. Etzel and H. R. Judah.

WOMEN'S EDUCATIONAL AND INDUSTRIAL CO., June 2. Object, the increase of good-fellowship among women, in order to promote the best means of securing their educational, industrial and social advancement. Directors—Margaret Deane, Hannah M. Solomons, Mary B. West, Jean Parker, Emilie E. Kirketerp, Harriet M. Skidmore, Abbey Cheney, Adeline N. Belcher, Ellen A. Milkken, Katherine Peixotto and May Lightbody.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none out worthy men.

J. C. HOAG—San Francisco.
R. G. BAILLY—San Francisco.
SAMUEL CLIFF—San Luis Obispo Co.
O. J. WADSWORTH—Cuba, Cal.
W. W. THORALD—Los Angeles and Orange Co's.
E. H. TAFT—San Joaquin Co.
JOHN B. HILL—San Diego Co.
E. H. SCHAEFFLE—Caveros Co.
FRANK S. CHAPIN—Colusa Co.
JOHN R. BOYCE—Alameda Co.
W. B. FROST—Marcel and Stanislaus Co's.
GEO. WILSON—Sacramento Co.
T. M. STARKES—Sierra Co.
H. KELLEY—Modoc Co.
H. H. PARKER—Del Norte Co.
WM. H. HILLARY—Oregon.
R. G. PARSONS—Oregon.
R. G. HUTTON—Montana.

MECHANICAL PROGRESS.

A NEW MODE OF CONSTRUCTING BOILERS.—Boilers are about to be made in England to consist of a series of weldless rings joined together by rivets. London *Engineer* says that Sir Joseph Whitworth & Co. have in contemplation the erection of additional works in the neighborhood of the Manchester Ship Canal, where they propose introducing an important departure from the present practice in the erection of marine and other boilers. It will be remembered that at the recent Manchester Exhibition the above firm exhibited a weldless boiler ring, 12 feet diameter by 6 feet long, which at the time attracted very considerable attention; and at their new works it is their intention to lay down a plant for the construction of boilers built up of weldless rings, for which it is claimed that while they reduce the weight of the boiler by 30 per cent, it is at the same time kept up to its full strength. So far, no marine boilers have been constructed on this principle, but that there is no difficulty in the manufacture of these weldless boiler shells for the above purpose has been evidenced by what Sir Joseph Whitworth & Co. have already accomplished. In some instances these shells would go up to 14 feet diameter, and the practically insurmountable difficulty of conveying such large pieces of work either by rail or road renders it, of course, necessary that works for their manufacture should be placed at the water side.

AUTOMATIC PRINTING PRESS FEEDER.—A firm in London has devised and put in operation an ingenious arrangement by which the operation of automatically feeding single sheets of paper to printing machines of the ordinary cylinder pattern or two feeder, perfecting, lithographic, or ruling machine, is successfully carried out. The apparatus is the invention of Messrs. Cleather & Nichols, of 23 Manchester avenue, Aldersgate street, London. By this apparatus the operation of automatically separating a single sheet of paper from the bulk and laying the sheet to exact register in the grippers of the machine is perfectly effected. To carry this out, two boards are affixed in the usual position on the sides of the machine, which sides also carry two vertical sliding frames surmounted by a cross-head which supports a radial beam for the purpose of regulating the weight or pressure upon the paper, the apparatus being allowed efficient play on the slides by means of anti-friction pulleys. The motive-power for carrying the sheet forward is taken by means of a chain-drive from the shaft of the cylinder, thus insuring that no sheet is fed except in accord with the motion of the cylinder.

GAS AND STEAM IN THE SAME CYLINDER.—In a paper recently read before the French Academy of Sciences, M. Ch. Tellier spoke of a new scheme for cheap power, by which he claims to be able to produce motive-power by using a combustible gas, employing the heat generated by its explosion to generate steam, and the use of the vapor of ammonia. When the gas has operated on the piston, it escapes at a temperature of about 400 degrees into a generator, where steam is produced, which is used to act upon the opposite side of the piston from the gases. There are two advantages claimed for this—the high temperature due to combustion of the gas prevents cylinder condensation, and the steam assists in lubrication. The completed machine for which this claim is made will consist of two cylinders, one making its forward stroke under the action of the explosive gases, and its return stroke by the action of steam; the other is operated entirely by vapor of ammonia. Under these conditions, says M. Tellier, there can be no doubt, theoretically or practically, that .44 pounds of coal per horsepower per hour is an economy which can be secured.

CASTING AND FORGING.—The great distinction which has heretofore existed between casting and forging is being gradually lessened. Press forging—forming articles by pressing them into shape in a red-hot or half-melted condition—is now being very generally introduced all over the world. The most intricate forms and sharpest lines are now readily produced by recently invented machinery capable of exerting thousands of tons of pressure. A large number of the smaller articles are now being made on this principle in San Francisco. Powerful plungers, driven by hydraulic or other force, forcing or "flowing" the heated iron into metallic molds, simply require celerity of action to prevent cooling by radiation. The system is both practical and economical as compared with the old methods of casting or hammering.

WHY THE SOUTH DOES NOT MAKE STEEL.—According to a communication from William B. Phillips of Birmingham, Ala., in the Bulletin of the American Iron and Steel Association, the chief reason why the South does not make steel is a matter of dollars and cents. Furnaces down there are doing so well on foundry forge and mill irons that the inducement to enter into the production of the metal in its higher forms is as yet a sentimental appeal to local pride and the spirit of emulation. So long as steel-making, which is an untried experiment in the South, with an outcome to be determined by a contact with contingencies, can offer no higher rate of profit than ordinary

pig iron, it is not to be expected that capital will quit the beaten track of manufacture, now satisfactory in its pecuniary results, in order to demonstrate a capacity for a wider range of accomplishment.

PERFORATED SAW BLADES.—Perforated blades for band and circular saws are just now attracting attention in Germany, and are apparently giving general satisfaction. Blades of this character, as some of our readers may know, are not entire novelties, but have been known in modified forms for some years. As a general thing, however, their use has been much decried. Still they appear to have some advantages worth considering, and many claims of superiority are made for them. Among them is that of reduced blade friction, due to reduced area of rubbing surface; less tendency to heat, because of the circulation of air through the holes, and economy of power. The holes further prevent the dangerous extension of cracks in the saw blades, and, in general, make it a comparatively easy matter to keep the saws in good running order.—*R. R. Gazette.*

A NEW RAIL.—The Bargioli rail, which the Southern Pacific Company will experiment with, is the invention of an Oakland mechanic. It is in two sections. The upper part or rail proper has a wedge flange which sets in a matrix groove in the lower part or bed. Both are united firmly by bolt catches. In a channel at the foot of the wedge terminal will be inserted a cable or bundle of telegraph wires. A perfect insulation is thereby effected, and the pole system of stringing wires will be obviated. Telegraphic communication between stations and gliding trains can be maintained easily. It is claimed that this new-fangled rail will afford better traction and that it is superior generally.

ALUMINUM ALLOYS.—According to Mr. J. H. G. Dagher, says the *Horological Journal*, alloys containing 60 to 70 per cent of aluminum are very brittle, glass hard and beautifully crystalline. With 50 per cent the alloy is quite soft, but under 30 per cent the hardness returns. The 20-per-cent bronzes have a whitish-yellow tint, and is so brittle that it can be pulverized in a mortar. The brittleness of alloys containing more than 11 per cent prevent their use, but from 11 per cent downward to 1½ they are of very great value, possessing great tensile strength, high resistance to compression, low specific gravity, and greater resistance to corrosion than any alloy known.

ANNEALING AND HARDENING.—Copper, brass, German silver and similar metals are hardened by hammering, rolling or wire drawing, and are softened by being heated red-hot and plunged in cold water. Copper, by being alloyed with tin, may be made so hard that cutting instruments may be made from it. This is the old process of hardening copper, which is so often claimed to be one of the lost arts, and which would be very useful if we did not have in steel a material which is far less costly and far better fitted for the making of edge tools.

PROPELLING CARRIAGES BY GAS. is a new method now being introduced into the cities of Germany. The gas is generated from benzene. Numerous vehicles of this description are said to be in successful operation in several cities and on some of the country roads, where they move at the rate of ten miles an hour. A new motor has been devised for this purpose, which is placed in the rear of the vehicle and over the main axle. The benzene is carried in a receptacle under the seat, which holds enough of the fluid for a trip of 80 miles. The gas mixture is ignited by an electric spark.

ALUMINUM BRONZE FOR PROPELLERS.—Aluminum bronze is coming into more general use in Germany, and as an instance it may be mentioned that aluminum bronzes are being used for propellers for all the naphtha boats that are being built at the establishment of Esher, Wyss & Co. It is also being used for propellers elsewhere, for bearings, boat-fittings, etc. It consists of 90 per cent copper, 10 per cent aluminum, looks almost like gold, and has the same weight as iron.

IMPORTATION OF IRON INTO JAPAN is increasing yearly. Last year the total was nearly double that of 1887. The increase was most marked in rails, but iron work and machinery show a marked increase. The value of the iron produced in Japan is only about \$250,000 per annum, or about three per cent of the value imported.

THE SCREW.—Screws of all kinds are still a theme for study, especially in the wood working line. Some one has proposed to make them hollow, and after they have been driven into place, to expand them a trifle with a wire nail to get more of a hold in the wood.

ENGINE VIBRATION.—In cases where there has been excessive vibration noticed with engines hotted to beams or girders of the upper stories of buildings, hanging heavy weights from the bottom of the engine has overcome the vibration almost entirely.

IN USING EMERY WHEELS it has been found that at a high speed one ounce of wheel material would only grind off six ounces of metal, while at a lower speed it would grind off 11 ounces. At this lower speed the wheel was making 2150 revolutions.

SCIENTIFIC PROGRESS.

Formation of Hailstones.

Meteorologists are not a unit in agreement upon the manner of formation of hailstones. The theory of Dove has been given most credence. He believed that the hailstones passed rapidly from the cold air to the warm, moist air, and again from the warm air into the colder, thus alternately taking on a jacket of moisture and freezing it around the nucleus or heart. The formation of the nucleus itself, it is conceded, is from the snowflake in the cold cloud, which being whirled about forms a small ball, about which subsequent layers congeal as the ball is tossed about into the atmosphere of different temperatures. The hailstone, from its varying shapes and angularities, shows that it has had a wild and irregular career in the sky, sometimes melting into crooked shapes, then being tossed upward and congealed rapidly. It takes but ten minutes, so the meteorologists say, to form the largest hailstones known. Some are nearly spherical, more rough and jagged, while some have a flat face on one side and are covered with nodules on the other.

The most remarkable hailstorm on record was that of July 13, 1783, which passed from Touraine, France, to Belgium. It traveled in bands or separated belts. While the western band had a width of ten miles and a length of 420 miles, the eastern band had a width of five miles and a length of 500 miles. A band of rain twelve miles wide was between them. Over 1000 communes suffered and property to the value of \$5 000 000 was destroyed. The most fatal storm of this kind was that of April 30, 1888, at Moradabad, India, in which over 280 lives were lost. John Eliot, meteorological reporter to the Government of India, says of this storm: "Verandas were blown away, and the massive Pucca portico was blown down. It was nearly dark. Hail was on the ground two feet deep. Persons caught in the open were simply pounded to death. The area of this storm was only about six or seven miles around Moradabad."

Probably the worst hailstorm that ever occurred in this country was that of June 16, 1882, at Dubuque, Iowa. For 13 minutes, beginning at 2:35 P. M., hailstones fell, some of which were 17 inches in circumference. The largest weighed 1½ pounds. They exhibited diverse formations, some of them having knobs and icicles half an inch in length. Others were surrounded by rings of different-colored ice with gravel and blades of grass imbedded within. The foreman of the Novelty Iron Works stated that he melted two which had living frogs within them. This report comes from the *Monthly Weather Review*, issued by the Government.

A Dubuque newspaper report accompanying the picture states that hailstones as large as cocoanuts were thrown down, and some ladies cooled a pitcher of lemonade with them, and wrote to Eastern friends that they had made the drink palatable with ice frozen in that city on June 16. In falling the stones went through the roofs of street cars.—*Baltimore Sun.*

AQUEOUS SOLUTIONS OF ESSENTIAL OILS.—It has been found by Bergmann that while mixtures of the fixed alkali soaps with hydrocarbons and essential oils form only emulsions in water, under separation of the respective oils, a mixture of an ammonia soap with an essential oil will form a clear solution in water, especially in presence of an excess of ammonia. Turpentine oil, or some other essential oil, is first mixed with castor oil, or a mixture of it with some other fat oil, the mixture is then subjected to the action of concentrated acid, and the product, after being washed with solution of salt, is saturated with ammonia in excess; or the fat acids may be first separated by treatment of the fatty oil with concentrated acid, then washed with salt solution, and the essential oil added either before or after saturation with ammonia. The preparation thus obtained is said to form a clear solution, and not only to possess the properties of a soap, but also to exercise, in aqueous solution, the solvent action of an essential oil.—*Pharm. Jour.*

A NEW FUEL.—A St. Petersburg journal states that a Russian civil engineer, M. de Nicolaoff, has succeeded in producing a fuel from peat greatly resembling anthracite coal. The inventor has obtained a patent for his process, which is said to be accomplished by the aid of certain chemicals, and lately an imperial commission has been engaged in experimenting with the fuel, the result having been very favorable. The peat was found to give a little less heat than ordinary coal, but more than fir or birch wood, which is largely used on railways and steamers and in factories in Russia. In other respects, however, the peat is superior to coal, being cheaper, containing but a very small percentage of sulphur, and being much smaller in bulk. The artificial fuel throws off no dirt and emits no smell, while burning with a clear white flame. It is believed that the new fuel has a great future before it, the Russian Government being much interested in the invention.

GRAVITATION AND DISTANCE.—Some one says that the physicist is bewildered by the apparently simultaneous action of gravitation upon

widely separated bodies. M. J. Van Hepperger thinks that the time taken by gravitation to travel the distance from the sun to the earth does not exceed one second. Would it not be more reasonable and correct to say that gravitation is a constant force, always universally present; that it never "travels" as do light and electricity, and whenever the greater loses its influence by distance, the lesser acts immediately—that neither "travels"? Distance simply weakens the force.

Brittle Bodies.

Under the head, "What are brittle bodies?" Prof. Frederick Kick recently communicated the preliminary results of some very interesting experiments in *Polytech. Journal*, 274, 405. He starts with two theses: (1) Those bodies or substances are brittle which, in order to become ductile or plastic, must be subjected to a high pressure, acting uniformly from all directions; (2) the hardness of a substance may be determined with numerical accuracy by means of its shearing stress if every bending and every fluxion of the material particles be excluded. To substantiate the first thesis, the following experiments were made with pieces of gypsum, eucastite, rock salt and calcite, all of which are, under ordinary conditions, very brittle. The test materials were cut and ground into prismatic shape. A suitable piece of ordinary iron gas pipe was closed at one end with a well-fitting plug, and filled with molten shellac, avoiding carefully any formation of bubbles. Into this were immersed the test pieces, which had previously been coated with shellac solution, and after filling up the remaining space with shellac, the top was closed by a second plug. The pipe was allowed to cool slowly for several hours, and then bent into U-shape. In dilute nitric acid the iron pipe was dissolved, leaving the shellac core unaffected. This was dissolved in alcohol, leaving the bent prism of rock salt, eucastite, etc., in perfectly coherent shape. The softer enveloping material, the better the results.

The author constructed then a simple but effective apparatus, in which oil was the enveloping medium instead of shellac, and succeeded in altering the shape of the most brittle substances without affecting transparency or coherence. In regard to the second thesis, the author's experiments are yet few in number. It seems true that the hardness and shearing stress are directly proportional, but more experiments are necessary to establish the thesis as a law of nature. Shellac and tin are substances of widely differing nature and composition. Their hardness, however, is equal, and Prof. Kick finds for both the same shearing stress, i. e., 2.6 kilogrammes to the square centimeter.

DUST IN THE AIR.—Mr. John Aitken has been continuing his researches into the number of dust particles in the air, and recently read a long paper on the subject before the Royal Society of Edinburgh. Swiss air he finds to be comparatively free from dust. So is Highland air; for example, some wild parts of Argyleshire, Scotland, have little more than 200 particles in the cubic centimeter of air. This is about the lowest he has yet observed. Paris has 210,000 to 160,000 particles per cubic centimeter. In all the fogs tested, the proportion of dust was found to be very high. Particles of dust serve as so many nuclei on which the moisture of the atmosphere can most readily condense into fog.

INFLUENCE OF HIGH TEMPERATURES ON CONDUCTIVITY.—The alterations in the conductivity of pure copper, aluminium and magnesium, and of commercial zinc and German silver, after a lengthened exposure to a high temperature, have recently been investigated by J. Bergmann. Discs, 70 millimeters in diameter, were heated to 300 degrees C., and maintained at that temperature for one hour, and then allowed slowly to cool. The conductivity of copper was increased by something like 2.4 per cent by this process; that of aluminium, magnesium and zinc being increased respectively, 5, 6.8 and 2.4 per cent. The conductivity of the alloy was, on the other hand, diminished by about 2 per cent.

A UNIQUE BAROMETER.—An old Belfast sea captain has improvised a unique barometer which he believes to be most accurate. It consists of a thin strip of white pine with a number of cross-pieces upon it. This is hung on the side of a building, and when damp weather is approaching the barometer bulges out in the center, while in dry weather the center sinks in and the ends out. The captain claims it to be correct, and would not exchange it for the most valuable patent weather indicator.

A STRANGE GIFT, IF REAL.—M. Pedroux, a physician at Nantes, France, has the strange gift of being able to see the color of sounds. He says that human voices are red, blue, black, tan, slate and all other colors, and that the color of some very handsome women's voices is like buttermilk.

IN THE MILK OF A CODEFISH, the microscope discovers animalcules so minute that 100,000 of them would not exceed in bulk a single mustard seed; and the creatures are supplied with organs as complete as those of the whale or elephant.

PIG IRON is made in 25 States of the Union.

GOOD HEALTH.

TURPENTINE FOR LUNG TREATMENT.—A writer in the *Medical and Surgical Journal* says: "I have been using pure oil of turpentine in affections of the throat and lungs for some time, and find better and more satisfactory results than from any other remedy I ever tried. I use the ordinary hand atomizer, and throw a spray of the liquid into the throat every few minutes, or at longer intervals, according to the gravity of the case. The hnh of the instrument should be compressed as the act of inspiration commences, so as to insure application of the remedy to the whole surface, which can be done in cases of children very successfully. It is surprising how a diphtheritic membrane will melt away under an almost constant spray of pure oil of turpentine. I now use the turpentine spray whenever a child complains of sore throat of any kind. In cases of tuberculosis of the lungs, bronchitis, and the latter stages of pneumonia, I have found the turpentine inhalation very beneficial. I use an atomizer, or paper funnel, from which the turpentine may be inhaled at will. I hang around the bed and in the room, flannel cloths saturated with oil of turpentine, in all cases of catarrhal bronchitis—in fact, in all affections of the air-passages, and my patients invariably express themselves as being much relieved."

MEDICATED LIQUID SOAPS.—In a paper read before the recent congress of Russian Pharmaceutical Societies, Herr Seidemann called attention to the therapeutic value of liquid soaps, which he claimed to present the advantages of being more suitable for injection, favoring admixture of medicinal substances, and being always producible from vegetable oils, thus avoiding the use of animal fats. The formula recommended by him for a liquid soap is to mix one part of caustic potash dissolved in an equal weight of water with four parts of olive oil and one-fourth part of alcohol, and shake it vigorously during ten minutes. The mixture is repeatedly stirred during the next hour, then mixed with an equal quantity of water, and after standing several days filtered. The author states that carbolic acid incorporated with a potash soap has its caustic and poisonous properties paralyzed, while its disinfectant action appears to be increased. It is also stated that the Berlin District Sanitary Commission has found a solution of potash soap in 10,000 of water to completely prevent the development of the spleen fever bacillus, and has recommended a solution of 15 parts in 10,000 as one of the best disinfectants.

ACHIEVEMENTS OF SURGERY.—At the Surgical Congress at Berlin, Prof. Gluck of Berlin gave (says Dalziel) an exhibition showing a most valuable advance in surgery, namely, the successful substitution of catgut, ivory, and bone freed from chalk, for defects in bones, muscles, and nerve sheaths. The juices of the body are sucked up in the inserted material, thereby establishing the junction of the separated ends, without any shortening of the part. He presented the cases of patients in whom there had been an insertion of from six to ten centimeters of catgut to supply defects in the leaders of the hands, to which complete mobility had been restored. This case has previously been impossible. In the case of another patient Prof. Gluck removed a tumor from the thigh, causing a considerable defect in the bone. He inserted ivory, and no shortening ensued. In another case he removed a large piece of nerve in the groin and inserted catgut, and the functions remained completely satisfactory.

TIGHT COLLARS.—The influence of wearing tight collars in impeding the circulation in the head by pressing on the jugular veins is well known to military surgeons with the troops in India; but the bad effects of such pressure in cooler climates have been demonstrated by the observations of Prof. Forster of Breslau, who states that 300 cases have come under his notice in which the eyesight has been affected by the disturbance of the circulation caused by wearing collars that were too small.

CONSUMPTION FROM DISEASED MEATS.—The result of several hundred experiments conducted at the laboratory of the University of Pennsylvania leaves no room for doubt that consumption can be, and beyond question very often is, contracted by eating tuberculous meats. It was found that calves and pigs fed on milk infected with tuberculous material from a human source contracted consumption, and the converse would seem probable.

TOBACCO SMOKE quickly contaminates delicate fruit of all kinds. A few whiffs blown upon a box of raspberries will entirely destroy the delicate flavor of the fruit and render it unpalatable. The same in a degree may be said of strawberries.

CURIOUS SPRING.—There is said to be a spring of a curious nature near Stonington, Conn. When the water is drunk the veins of the drinker are said to swell in a most extraordinary manner; but the effects gradually disappear.

POISON IN CELERY.—Dr. Charles M. Creeseon of Philadelphia states that he has more than once found the typhoid bacilli in the juice that has been squeezed out of celery grown near Philadelphia. *Annals of Hygiene.*

ENGINEERING NOTES.

RAILWAYS IN AFRICA.—The French are very active in Central Africa, but in a quiet way. A French engineer, Capt. Trivier, has just completed a journey through Africa, similar to that performed by Stanley, but undertaken with a view to strengthening French commercial stations. He has strengthened old and established new French stations all the way from the West Coast to the south of the Congo river. It is expected that active steps will be taken to facilitate the development of those regions by the construction of railways which shall form a means of communication through French territory from the coast to the river Congo. A company is being formed with that in view. The Congo State Railway Company also intend to open up that region as rapidly as possible by proper railway connections. Considerable attention is bestowed at the present moment upon the colony of Tunis, which has a fascinating reputation in France for its mineral wealth and resources. Railways are being extended in all directions, and as the present constructive capacity is not sufficient for the wants of speculators, a bank has just been formed for financing such enterprises in Tunisia. This rapid opening up of Central Africa to the commerce of the world will soon prove one of the marvels of this progressive age.

THE HUDSON RIVER TUNNEL has been found to be a much more difficult engineering project than was originally supposed. As the work proceeds out under the river, the silt becomes softer and more difficult to hold. Engineers are coming to the conclusion that it will be impossible to go much farther with the work by use of the present shield. The one now in use was of the same construction as was used in the stiff clay under the Thames river at London, but has never before been used in soft, wet ground. The lining on the New Jersey side is already in bad condition, hulging in places, and will probably have to be stiffened with more lining to make it safe. Very little progress is now being made from either side. The difficulties and discouragements are great enough to discourage the most skillful engineers. It is thought that some new methods will have to be employed or the work must shortly stop again. It is to be hoped that the work may in some way be completed, as its abandonment would be a great loss to capital and a decided damage to modern engineering. Railroads must eventually cross the river either over or under it, or both. Ferry boat transportation will have to be abandoned at all such places.

SHORTENING THE ROUTE TO EUROPE.—The scheme of greatly shortening the time between America and Europe by the construction of a railway to the coast of Labrador, and putting on a line of fast steamers to Milford Haven, looks less reasonable the more it is considered. No engineering plans have yet been formulated. The distance, even, is as yet quite uncertain, but not less than 1000 miles of road will be required. The cost of the work cannot be intelligently guessed at. The country is desolation. The winters' snows are fearful. Even grain will not ripen in the short summer. The traffic along the greater portion of the route would be nearly nil. More than 30 rivers will have to be bridged. The proposed terminus is at a port on the Labrador coast, which there is good reason to believe is closed by ice a large portion of the year. But few travelers would think of taking such a route outside of, say, four summer months. It is quite safe to say that the proposed Labrador railway will never be built.

THE HIGHEST GRADE.—An interesting little railway has just been opened for traffic between Lynton and Lynmouth, which are separated from each other by a cliff nearly 500 feet high and are only connected by a road so steep as to be almost impracticable for vehicles. The new line is 900 feet long with a uniform gradient of 1 in 13, which is the steepest incline in the world. The road is operated by two cars connected and moved by a wire rope, the one dragging the other up the line as it descends, the necessary excess of weight being obtained by filling a tank on the car at bank from the reservoir already mentioned. Safety appliances have been fitted to prevent a breakaway of the cars in case of accident.

BRIDGING THE NORTH RIVER.—The Hudson river bridge known as the Greene hill has become a law by lapse of time without the signature of Gov. Hill. It provides for erecting what is practically Mr. Lindenthal's bridge at New York, a central span of 2550 feet, and six tracks, with room for ten, being provided. It is not in the interest of the Lindenthal bridge which is now before Congress, but so far as appears upon the surface is a mere "strika," to get a certain control of a valuable franchise and sell out. Should the Lindenthal bill pass Congress, however, it will require no State action to confirm it, while the New York bill is worthless without concurrent action by both New Jersey and Congress.

PUMPING UNDER GREAT PRESSURES.—In the coal mines at Kladow, in Bohemia, there are located two pairs of compound pumping engines which form a notable plant. They drive double-acting plunger pumps with 28-inch stroke for one engine and 3-foot stroke for the

other, and run at a speed of from 40 to 72 revolutions per minute. The engines are located 1700 feet below the surface of the ground, and they raise water against this whole head, doing the work with ease and smooth running. The pumps are the invention of Prof. Riedler of the Polytechnic Institute at Berlin, and the design has given remarkable results wherever used.

USEFUL INFORMATION.

A NEW JOINT MAKING MATERIAL.—A permanent and durable joint can, it is said, be made between rough cast-iron surfaces by the use of mineral asbestos mixed with sufficient white lead to make a very stiff putty. This will resist any amount of heat, and is unaffected by steam or water. It has been employed for mending or closing cracks in cast-iron retorts used in the distillation of oil and gas from canal coal. The heat being applied to the bottom of the retorts and the temperature of the iron maintained at a bright red heat, after a time the bottom of the retort would give way, the larger portion of the crack being downward toward the fire. The method employed was to prepare the mixture, and place it on top of a brick, then put the brick on a bar of iron or shovel, and press the cement upward to fill the crack in the iron, holding it for some time until it had penetrated the cavity and somewhat set. Of course, during this operation, the lid was removed from the retort, so that no pressure of gas or oil forced the cement outward until set. For several reasons the use of asbestos is very excellent. It is well known that this substance cannot burn and there is no danger of it being the cause of fire in the shops where it is used. The idea is being largely adopted by foundrymen generally.

TO CLEAN A SPONGE.—When a sponge has become slippery and disagreeable to the touch, the following simple method will be found very efficacious in cleansing it: Put a piece of common soda, about the size of an egg, into a quart of boiling water; allow it to stand until just brisk warm, by which time the soda will be entirely dissolved, then put in the sponge; let it remain for half an hour, then squeeze it thoroughly, extracting as much of the slimy substance as possible. Repeat the process, using clean water prepared as above, until the sponge feels soft and pleasant to the touch. Two waters are generally sufficient to effect the purpose.

WEST POINTERS NEVER SMILE.—It is said that smiling is something totally against the rules at West Point. No man ever dreams of smiling at anything, no matter how ludicrous, when he has been in the West Point academy a few weeks. The face is required to have a stony, expressionless stare, the eyes fixed as if in a trance, gazing on futurity. The head is thrown back, the arms held rigidly, the body straight, and this is the attitude of "attention," which is expected to be the normal condition of a cadet, except when speaking with his own or with lower classmates.

COSTLY BARN.—A contemporary says that the costliest horse barn in the world belongs to D. E. Crouse and is located at Syracuse, N. Y. It has now cost the owner something like \$700,000. Incidental expenses will make the stable cost little short of a round million. Rockefeller, the Standard oil king, is about completing a \$3,000,000 mansion at Tarrytown. The estate comprises 1000 acres, and a \$100,000 house was torn down to furnish a foundation for the new stable.

ALLOYS.—Among the most valuable substances known in the arts are the metallic alloys. It has been recently discovered that strong as steel is, it can be made yet stronger by an alloy of three to five per cent of nickel. This means that in the future we can have larger bridges, higher towers and lighter machinery than ever.

TO PRESERVE LAMP CHIMNEYS.—A woman in Americus, Ga., is using a lamp chimney that she has used daily for the past eight years, and she expects to use it for many years yet. She says that she hauled it in salt and water when it was bought, in 1882, and no matter how large a flame runs through it, it won't break.

GOLD LEAF.—The Berlin gold-beaters at the Paris Exposition showed gold leaves so thin that it would require 282,000 to produce the thickness of a single inch, yet each leaf was so perfect and free from holes as to be impervious to the strongest electric light.

CEDAR OIL is now produced at Lyndon, Vt., by distillation. The small branches of cedar trees are used, and are much more convenient and productive than shavings, which are used to some extent. The oil can be profitably produced wherever the cedar grows.

QUICK PHOTOGRAPHY.—A great progress is being made in rapid photography. Lord Rayleigh has photographed a minute jet of water in the 100,000th of a second; and a new camera takes ten successive views a second on the turning of a crank.

A SILK HANDKERCHIEF, so often recommended for wiping spectacles or eyeglasses, is not good for this purpose, as it makes the glasses electrical and causes the dust to adhere to them.

ELECTRICITY.

THE BOLDEST ELECTRICAL PROJECT yet suggested is one which is under consideration in Russia for a line from St. Petersburg northeast to Archangel on the White Sea, a distance of over 500 miles. It is proposed to furnish the electric current from a series of generating stations distributed along the line, and the cost of the undertaking, including rolling-stock, is estimated at only about \$15,000 per mile. Archangel, the proposed northern terminus, lies in the icy latitude of 64½ degrees, almost up to the Arctic circle. It is far above the latitude of the northern shore of Hudson's bay, and almost as far north as the narrowest part of Behring straits, the suggestion of crossing which by a railway has been assumed by many to be impracticable. Who knows but that electricity is to furnish the solution of the difficulty of operating railways in extremely cold regions which attends the use of steam? Evidently an electric railway can be built of any desired length if power-generating stations are supplied at proper intervals, and hence it becomes only a question of obtaining sufficient traffic to warrant the cost of construction and operation. The electric locomotive has no steam or water pipes to freeze and burst in the intense and long-continued cold of a far Northern winter, and electricity, by which trains can already be lighted, will doubtless be long and successfully applied to the purpose of heating also. Should the remarkable enterprise of an electric railway to the White Sea be actually carried into execution, it will not be hard to believe that a similar line may be pushed through Alaska to meet at Behring straits an extension of the Russian railway system through Siberia, and complete a continuous railway line uniting America, Asia and Europe.

ELECTRICITY VS. HORSES.—Joseph Wetzler, a well-known New York electrical expert, expresses his opinion on the comparative economy of horses and electricity on street railways as follows: "The operation of street railways by electricity, although even now completely demonstrated to be more economical than by either horses or cables, is yet too recent to afford the more reliable figures which can only be obtained after extended use; but from an investigation recently made on a number of roads by O. T. Crosby, some very interesting data are developed." The results of Mr. Crosby's investigation show that the average cost of motive-power for the roads in Washington, Richmond, Cleveland and Scranton, was about 5.09 cents per car mile. At the late eighth annual meeting of the American Street Railway Association, the committee to whom the matter was referred, reported that "if it is desired to make a change from horse-power, electricity will fill the bill to perfection, no matter how long or short the road, or how many passengers are carried. In the investigation of the subject the most satisfactory results have been shown; it not only increases the traffic over the road, but reduces expense, and actually enables us to operate a line, which heretofore entailed a loss at a profit."

AN ELECTRIC SEA GOING VESSEL.—While it is beyond a doubt that Americans lead in many of the classes of electrical development, there is also no doubt that in the application to marine engines the English lead us. A second sea going electrical vessel has now been launched. It is 26 feet long by 5 feet 4 inches beam, and will hold 15 people. The craft has 18 inches mean draught and a displacement of 2½ tons. She steers by tiller, and a switch controlling the power is within easy reach of the helmsman. Under the seats are 40 hand-lined compartments for accumulators. With the battery, it is figured that power will be furnished at one charge sufficient to propel the craft 8 miles an hour for 5 hours. The motor is in the central compartment of the boat. This craft is built for sea-going purposes, and has trial trips indicated considerable speed and sea going qualities. She was built for Mr. Paare, her owner, by W. S. Sargent, electrical-launch builder, Cheswick, England.

COMPUTATIONS BY ELECTRICITY.—The computations to be made after the taking of the census the present year are to be made by electrical machinery, which is capable, it is said, of doing the ordinary work of 55 hours in five hours. Special sections of the canoes, including homes and farm mortgages, etc., will receive careful attention, and every effort will be made to have the entire work performed in the shortest possible time consistent with the immense amount of necessary labor and the importance of the general result.

RIVETING BY ELECTRICITY has been successfully accomplished. The cold rivet is placed in the hole, and when heated to the proper temperature it can be closed by any of the ordinary apparatus now in use. The heating of a half inch rivet of two or three inches in length takes about half a minute.

ELECTRICITY IN LONDON FOGS.—In London they are utilizing electricity in a novel way. During heavy fogs, horses carry an electric light on their heads which can be illuminated as occasion requires, the storage battery being in the wagon.

BASE BULLION is being shipped by the carload from Colville, Washington, to Newark, New Jersey, for refining.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hinkle's Improved Roasting Furnace for Sulphureted Ores; Abandoned Hydraulic Mine Showing Growth of Young Trees, 377. Sketch of Apparatus for Mine Ventilation; Ventilating an Upraise; Hoskins' Hydrocarbon Assay Furnace, 385.

EDITORIALS.—Passing Events; Local Shipbuilding; The World's Fair; Auriferous Gravels of California; Tree Growth in a Gravel Mine; Ventilation of Mines, 384.

CORRESPONDENCE.—Powell's Arid Argument on Irrigation; The Deep Gold Placers of California; Mineral Exhibit for the World's Fair at Chicago, 378-379.

MECHANICAL PROGRESS.—A New Mode of Constructing Boilers; Automatic Printing Press Feeder; Gas and Steam in the Same Cylinder; Casting and Forging; Why the South Does Not Make Steel; Perforated Saw Blades; A New Rail; Aluminum Alloys; Annealing and Hardening; Aluminum Bronze for Propellers; The Screw Engine Vibration, 382.

SCIENTIFIC PROGRESS.—Formation of Hallstones; Aqueous Solutions of Essential Oils; A New Fuel; Gravitation and Distance; Brittle Bodies; Dust in the Air; Influence of High Temperature on Conductivity; A Unique Barometer; A Strange Gift, if Real, 382.

GOOD HEALTH.—Turpentine for Lung Treatment; Medicated Liquid Soaps; Achievements of Surgery; Tight Collars; Consumption from Diseased Meats; Curious Sprains; Poison in Celery, 383.

ENGINEERING NOTES.—Railways in Africa; Shortening the Route to Europe; The Highest Grade; Bridging the North River; Pumping Under Great Pressure, 383.

USEFUL INFORMATION.—A New Joint-Making Material; To Clean a Sponge; West Pointers Never Smile; Costly Burns; Alloys; To Preserve Lamp Chimneys; Gold Leaf; Quick Photography, 383.

ELECTRICITY.—Electricity vs Horses; An Electric Sea-Going Vessel; Computations by Electricity; Electricity in London Fog, 383.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 380-381.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 383.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 383.

Business Announcements.

[NEW THIS ISSUE]

Mining Capital Wanted—Real Estate Exchange, Salt Lake City, Utah.
Flax Packing—W. T. Y. Schenck.
Rock Crusher—Pelton Water Wheel Co.
Iowa's Resources—Board of Trade, Boies City.

Passing Events.

As the fact becomes recognized that there will be no silver legislation by Congress at this session, the price of the metal gradually runs down. There has been an unloading of bullion which has aided in depressing prices, and it is thought there will be a still further decline. However, toward the end of the week there was a recovery in value as compared with the previous days.

Arrangements have been completed for a State Convention on the World's Fair in San Francisco on Sept. 11th, and a Committee of Arrangements has been appointed. It is pleasant to note that some systematic action is to be taken toward having California properly represented at the coming fair.

Two San Francisco foundries have sent representatives to Washington to bid on the new Government cruisers, and it is greatly to be hoped that some more of the vessels will be built on this coast.

There is very little to note concerning the mining situation aside from what we have mentioned in our usual "Mining Summary."

Local Shipbuilding.

The new cruiser *SAN FRANCISCO*, being built at the shipyards of the Union Iron Works, is rapidly approaching completion and will be ready for her trial trip early in July.

W. H. Taylor, the president of the Risdon Iron Works, and L. R. Meade, secretary of the same establishment, left the city on Monday for Washington to submit bids for the 5100 and 3300-ton cruisers, bids for which are to be opened on the 10th inst.

It is evident that the building of large iron and steel vessels is destined to be a very prominent industry in San Francisco. When the Union Iron Works commenced to prepare to do such work, our own people were somewhat skeptical as to the success of the undertaking, and the authorities at Washington could hardly believe that California mechanics had the facilities or skill to do the work. Experience has, however, shown it can be done, and done well. The Charleston was a complete success, and the San Francisco is about ready for trial.

Now more cruisers are to be built, and another large firm in San Francisco has started in to get the work. A few years ago there was no one prepared for such construction; but one firm having been successful, we now see two anxious to bid. This argues well for an increase in this industry in San Francisco.

This city has the necessary geographical situation to become the seat of a very large industry in the shipbuilding line. We have contented ourselves mainly thus far in building schooners and steamers for coasting and inland trade, but there is no reason why this branch should not be widely extended. Having proven that Government cruisers can be built here in competition with Eastern shipbuilders, it is evident that any kind of vessel can be constructed. The existence of the Pacific Rolling-Mills, with its extensive plant, is an important factor in this connection, for it is in a position to aid any of the local foundries which may obtain Government contracts. Certain work done by those mills relieves the foundries of the necessity of adding expensive appliances to their own plants. We should very much like to see two or three of our large foundries, each working on a Government vessel or two, and it is very probable this will be the case in due course of time.

The World's Fair.

At a meeting held in San Francisco on Tuesday last, the report of the Committee on the World's Fair was received and adopted, as follows:

That the World's Fair Convention be held in this city on Thursday, the 11th day of September next.

Each State organization and each county government to have a representation of five (5) delegates. Each local organization two (2) and each newspaper in the State one (1) delegate.

The Governor of the State, the State World's Fair Commissioners and their alternates, the Mayor of each city, or the Chairman of each Town Council or Board of Trustees, and the Chairman of each County Board of Supervisors, to be delegates, ex-officio.

That all commercial and industrial organizations; all art, scientific and educational institutions; all Chambers of Commerce and Boards of Trade, State and local; all societies of California Pioneers; all Parlor of the Native Sons and Native Daughters of the Golden West; the State Board of Agriculture and District Agricultural Societies; the State Board of Horticulture and County Horticultural Societies; the State Board of Silk Culture; the State Board of Viticultural Commissioners and County Viticultural Societies; the State Mining Bureau; the Patrons of Husbandry; all World's Fair associations which may be now or hereafter formed; all County Boards of Supervisors and all legislative bodies representing cities and towns in this State, be invited to send delegates.

We recommend that an assessment of \$1 be levied on each member of the convention, on Tuesday, June 3d, to defray expenses of printing, etc.

An amendment was adopted to the effect that the president, or, in his absence, the vice-president of each commercial organization throughout the State, be requested to act as delegate ex-officio to the World's Fair Convention.

A. T. Hatch offered the following resolution, which was adopted by a unanimous vote:

That the Honorable United States Commissioners for California of the World's Columbian Exhibition be and are hereby respectfully requested when they meet to arrange for awarding premiums to urge upon their fellow-commissioners that any individual exhibitors who may place their exhibits in the State collective

displays may compete for premiums on the same footing as individual exhibitors outside of State collective exhibits.

In addition to this, a San Francisco World's Fair Association was decided upon to represent the city and county of San Francisco.

Mayor Pond has appointed the following committees:

Committee of Arrangements for the State Convention to be held September 11th, in accordance with the plan decided upon by the General Committee—Col. C. L. Taylor, Chamber of Commerce; Major James D. Phelar, Art Association; Colonel William Harney, Manufacturers' Association; J. Q. Brown, State Board of Trade; E. W. Newhall, San Francisco Board of Trade; C. B. Binschn, State Board of Viticultural Commissioners; Homer S. King, San Francisco Stock Exchange; B. M. Lelong, State Board of Horticulture; W. L. Locke, Canned Goods Association; Irving M. Scott, Engineers and Iron Founders' Association.

Committee to Incorporate San Francisco's World's Fair Association—George W. McNear, Chamber of Commerce; M. M. Estes, State Board of Trade; Colin M. Boyd, Board of Supervisors; Colonel A. G. Hawes, Art Association; Isidor Jacobs, Canned Goods Association; A. W. Scott, Mechanics' Institute; A. S. Halliday, Manufacturers' Association; Jules Cerf, San Francisco Board of Trade; B. F. Bissett, Produce Exchange; C. Carpy, Wine Dealers' Association.

Auriferous Gravels of California.

In this number of the PRESS is given the concluding article of the series written by Henry G. Hanks on the auriferous gravels of California. The theory propounded by Mr. Hanks is at variance with the generally accepted one as to their origin, but he has given the reasons on which he bases his conclusions. Mr. Hanks' articles have interested very many of our readers, who will be still further interested by subsequent articles from the pens of others who do not agree with his ideas. We shall be glad to hear from any one who can contribute any facts bearing on the subject one way or the other.

The fact is that there is very little reliable data concerning our gravel mines. Few seem to have taken the trouble to make any permanent records. Take, for instance, the drifting districts of the Forest Hill ridge or divide, in Placer county. The earliest developments in this section (covering about 25 miles of the gravel channel) were confined to the more accessible portions of the beds. The amount of gold produced has been estimated at from \$25,000,000 to \$30,000,000, and the greater part of the ridge remains untouched. Many of the claims being worked out or proving unprofitable, were abandoned and the openings have been filled up by caving.

Information which has cost large sums of money to obtain, and which might have furnished a valuable guide in subsequent undertakings, was lost for want of a proper record. It has been necessary to repeat a great deal of prospect work merely to test the memory of predecessors.

Of late years a number of bolder enterprises have been started with the object of attacking the more deeply buried portions of the ancient gravel-channel system. It is difficult to obtain reliable data, and large expenditures have been made in determining the location, course and depth of channels. It is not unusual for a company to expend \$100,000 or more before determining the exact location or even the existence of a pay channel within the boundaries of its property. Two contributions on the subject of the auriferous gravels are promised the PRESS, and we shall hope to receive others.

ACADEMY OF SCIENCES.—At the meeting of the California Academy of Sciences, on Monday evening, the following donations to the cabinet were reported: Five hundred and eighty-two specimens of fish from the bay and coast, collected by Curator Eigenmann, one reptile, one batrachian, and four specimens of birds in flesh from L. Bolding of Stockton, and one Oregon mole from E. D. Flint of Oakland. Prof. J. S. Brandegee, who recently returned from a visit to Santa Catalina island, on the southern coast of California, showed a fine photographic view of the island, and gave a brief description of its beautiful scenery and its topographical features. He also spoke of its flora and fauna, and asserted that the island has the finest and best sheltered bay on the coast, excepting San Francisco.

JOHN FORD, one of the oldest residents of Grass Valley, and well known in mining circles all over the coast, died on Monday. He

was foreman of the Allison Ranch mine as long as that famous property was in operation. The deceased was about 60 years of age.

Tree Growth in a Gravel Mine.

The out shown on the first page is a photograph of a view taken by W. R. Nitting in one of the old abandoned hydraulic mines at Gold Run, Placer county. A landscape of this nature can be seen by the travelers on the Central Pacific railroad from the car windows. The photograph is reproduced here to call attention to the growth of young pines which has sprung up since the mines stopped work. Although the material is very unpromising for any plant growth, the soil having been washed away, these young trees are thrifty and vigorous and have attained a good size.

This is an evidence of how rapidly Nature will reproduce the forests of the Sierras, even under unfavorable circumstances. Of course in this instance no planting has been done by man, and no care has been given the young trees. In fact, one of these old hydraulic mines—a mass of boulders, cement and gravel—is about the last place in which any one would expect trees or plants of any kind to thrive. Possibly if people tried to cultivate anything there they would be unsuccessful; on the principle shown in the starting of a lawn in a suburban town where a carefully prepared plot, watered and seeded, has to be coaxed and cared for, while everything will grow luxuriantly in the walks where it is not wanted and gravel has been placed.

The question of forest culture, although now talked of and considered, has not as yet become as important with us as in older countries, where generation after generation has destroyed the trees in all directions. In some countries the Government has taken the matter in hand and enforced the planting of trees. Up to this time, on this coast, we have been too busy cutting them down to think much of the needs of those who come after us. The subject is, however, destined to become of more importance from now on. The State Board of Forestry is issuing bulletins of information and has established experimental forestry stations in California. The fact that the pines of the Sierras will reproduce themselves under such unfavorable circumstances as that indicated by the view, is encouraging to those interested in the subject of forest culture in this State.

Ventilation of Mines.

In the colony of Victoria they have a Board of Commissioners on the ventilation of mines, and the various superintendents give, under oath, their experience and the methods they adopt. Many of these statements are of general interest as applicable elsewhere. Geo. E. Thompson recently described a system he had devised. Tubing of requisite size is fixed in the shaft and extended to the workings. Above the surface this tubing is carried to where the exhaust steam from the engine or steam from a boiler can discharge direct into it. When the steam is not of sufficient pressure, a steam-pipe is carried through a heated chamber to increase the temperature. The bottom of the exhaust tube is closed except as to the insertion of the steam-pipe, and the top of the tube, into which the steam exhausts, is closed with a hinged door opening outward. It is computed that a 10-inch pipe and 20-inch exhaust tube, eight feet long, with engine working 180 strokes per minute, will remove air from the mine at the rate of 3000 feet per minute. A sketch of this system is given herewith. (See opposite page).

The manager of the Hercules and Eoergetic described a method he had adopted for ventilating an upraise from a crosscut. They had a shaft 10x4 feet in three compartments, and at the 700 ft. level drove a crosscut east about 255 feet and south about the same distance. Then they put up a rise 266 feet and they had a jet of water from the 540 feet, an inch pipe and an air collar of two feet. The air was got into this by a water-pipe coming down the shaft from the 540 ft. level. They put the pipes in the drive over the air-collar, which drove a current of air over the collar. At the end of the drive they put up the rise and then conveyed the pipes under the collar and up one division of the rise, and turning the pipe into the other division of the rise, the air was forced down with it. The accompanying out shows the arrangement adopted. The air was kept good in this rise by this means.

Hydrocarbon Furnace for Assaying, Etc.

[Geo. E. R. Ellis, F. C. S., of Montana, in "Journal" of the Society of Chemical Industry.]

I have ventured in this paper to give particulars of a piece of apparatus which my own experience—confirmed by that of many other assayers—has shown to be eminently serviceable as a readily controllable source of intense heat, such as is required by analysts, assayers, metallurgists, and others. This furnace has been before the American public for several years and is therefore past the experimental stage, but, so far as I am aware, it is comparatively or wholly unknown to the English scientist.

Assayers know full well that there are many inconveniences and annoyances necessarily connected with the use of furnaces burning coal or coke; this apparatus, on the contrary, does away with the constant replenishing of fuel, with all dust and ashes, and with a large

(2) Place the burner against the inlet of the furnace.

(3) Turn out burner flame with *E*, and immediately turn it on again without lighting it (or simply blow the flame out), when, if the furnace is hot enough, the gas will light inside the furnace. When burning inside the furnace, there must be no flame in the burner tube. The heat can be regulated by the use of *E* and *P*.

The tanks are made in two sizes; one contains half a gallon of oil, the other one gallon, and cost (with blowpipe complete) at Chicago respectively \$23 and \$26.

The muffle furnace is represented in Fig. 2. It is made in two sizes, the one taking a "C" Battersea muffle (8 inches long x 4½ wide x 3 high), the other an "F" Battersea (10x6x4). The inlet for the blast is opposite to, and below, the mouth of the muffle, and cannot be seen in the cut. The muffle furnace requires a length of two (not more) of stove-pipe in order

The temperature of an ordinary room at the same time was 16° C.

The general compactness of the apparatus is also a feature in its favor; the larger size muffle furnace stands 14 inches high, is nine inches wide and 12½ inches long, while the corresponding measurements for the crucible furnace, taking two crucibles at a time, are 10½, 8 and 14½ inches respectively. The whole apparatus can be conveniently used on a table four feet long by two feet three inches wide. It is also to be noticed that the burner in Hoskins' apparatus is outside of the furnace during the whole of the operation and is, therefore, not subjected to the destructive influence of very high temperatures, as is the case in many forms

FIG. 1.—SKETCH OF APPARATUS FOR MINE VENTILATION. (See Opp. site Page.)

amount of radiated heat; indeed it may be said that it possesses all the advantages of a gas furnace, with the additional advantage that it may be forced to practically any extent without the use of a blower or foot-hellows. Once pumped up—which operation occupies only a few seconds—the blast will continue for a long time without further attention.

The apparatus consists of three parts (each of which may be procured separately), viz.: The tank and blowpipe, the muffle furnace, and the crucible furnace. The tank and blowpipe are represented in Fig. 1. *P* is an ordinary force-pump at the bottom of which, at *A*, is a valve which closes automatically upon releasing the pressure from the pump. *C* is a check-valve which closes the inlet to the tank *T* completely; *F* is a filling screw for introducing the fuel used, viz., gasoline; *V* is a vent screw for letting off the pressure when the operation or experiment is finished; *H* is a pipe leading from the tank to the burner *D*; *E* is the burner-regulator, terminating in a fine point, closing the orifice of the burner; *S* are packing-boxes. Upon opening *C* and pumping a few strokes, a pressure is created in the tank and on top of the fluid, forcing it through the tubes of the burner, which being previously heated, vaporize the gasoline. This issues from the orifice at the end of *E* as a highly heated gas, and burns as such in the form of a powerful blast. After being once started, the heat of the flame, passing through the burner *D*, vaporizes the fluid in the tube, and hence the apparatus is automatic.

The air which is forced in is not consumed, so that to keep up the blast it only requires a few strokes of the pump occasionally (every half-hour or so) to maintain the pressure lessened by the consumption of the gasoline.

The way to start the blowpipe is simple and as follows: Close *E*, unscrew *F* and introduce gasoline according to the capacity of the tank. Replace *F*, close *V*; open *C* one or two turns, and give three or four full strokes of the pump *P*, then close *C*. Heat the burner by burning some of the gasoline in a suitable vessel (an old scroffler will do well) placed under the burner; when hot, apply a match and open *E* gradually until the action is more or less uniform. The burner is hot enough when no liquid or spray issues from the orifice; if not hot enough, let the oil burn slowly until no liquid or spray issues. When sufficiently heated, the blast can be made of any desired intensity by the use of the force-pump as above. The mouth of the burner *D* should be 2-3 inches from the inlet of either furnace, otherwise the combustion in the interior of the furnace will not be complete. To stop the action of the blowpipe, simply shut the regulator *E* or open screw *V*, or do both. When not in use, keep *V* open.

For very high temperatures on muffle work we proceed as follows:

(1) Light as above, and heat inside of furnace to bright redness.

to create a draught through the muffle, or they may be connected with a flue; in the latter case, a damper must be put in the pipe, for too much draught is prejudicial.

The smaller muffle costs \$10; the larger one \$15.

Figs. 3 and 4 represent the two kinds of crucible furnace, Fig. 3 being adapted for taking one crucible at a time; Fig. 4 for taking two or four crucibles at the same time. The No. 1 furnace costs \$4 and takes a crucible 4 inches in diameter and 5½ inches deep inside; No. 2 takes a crucible 5 inches in diameter and 6½ inches deep inside, and costs \$5; No. 3 costs \$7 and takes two crucibles 4 inches in diameter, while No. 4 costs \$12, and can take four No. 10 French crucibles, or equivalent sizes.

We will now consider some of the conveniences attending the use of this apparatus.

Cost of Running.—This naturally depends upon the local price of the fuel used as the source of heat, viz., gasoline. In a large city, e. g., Chicago or New York, the cost per hour does not exceed 3 cents, while 5 cents may be put down as the maximum in out-of-the-way districts. A certain prejudice exists against the use of gasoline, but, from its construction, no accidents can happen from use of this apparatus save as the result of gross carelessness.

Power of Furnaces.—The heat of the blowpipe can be controlled from that of a Bunsen burner to that required to melt cast iron. Using the crucible furnace, ½ pound of cast iron can be melted in 15 minutes (furnace cold at the start), or 1 pound of brass can be melted in 7 minutes (furnace hot at the start). The muffle furnace can be heated to a scorification temperature in 15 minutes. Six scorifications can be performed at the same time in the larger furnace.

Amount of Heat Radiated.—In this respect these furnaces will compare favorably with any in the market. The following readings were taken with the larger size muffle furnace during the scorification of some copper-silver ores:

Distance from Side (or Front) of Muffle.	Temperature.	Distance from Side of Muffle.	Temperature.
5 ft. (front)....	17° C.	9 in. (side)....	42° C.
22 in. " "....	21° C.	6 in. " "....	52° C.
13 in. " "....	28° C.	3 in. " "....	81° C.
19 in. (side)....	28° C.	1 in. " "....	103° C.
12 in. " "....	34° C.		

FIG. 2.—VENTILATING AN UPRaise.

of furnaces using ordinary coal-gas as a source of heat.

Note.—Since writing the above I find that a muffle furnace is now manufactured sufficiently large to accommodate a 15 inch by nine inch muffle. This furnace is heated by two blowpipes of the same size and power as described in the above paper.

This apparatus may be obtained from the manufacturers, Wm. Hoskins & Co., 81 South Clark street, Chicago, or from dealers in assayers' supplies.

THE STEAMBOAT MINE CASE.—The case of W. H. Bullock and others against the Mayflower Gravel Mining Company was this week transferred from the Superior Court of Placer

HOSKINS' HYDROCARBON ASSAY FURNACE.

county to the United States Circuit in San Francisco. Bullock and others seek to recover possession of the Steamboat placer mine, located in Placer county, near Forest Hill, besides \$1000 damages and \$50 000 rent for use of the mine, which, they claim, they were unlawfully dispossessed of. The directors claim that the mine was purchased by them in good faith from the Central Pacific Railroad Co.

A HANDSOME VIEW of the city of Tacoma has been published on a very large sheet by Will Carson. Accurate sketches of the buildings and the general surroundings give a very good idea of the city and its location.

Mines and Mills of Shasta County.

NUMBER IV.

[From our Traveling Correspondent.]

After returning to Shasta from Iron Mountain, I was somewhat at a loss as to my next move, whether to go to Old Diggings or French Gulch, but after talking with some of the old settlers concluded to go to Old Diggings as being the liveliest and finest part of Shasta's mining labor. Old Diggings is on the east side of the Sacramento river, the upper part being about 10 miles from Redding and the lower about six. It is one of the celebrated localities of the olden time for gold. Its placers were immensely rich, and even to this day, when there is a hard rain, the miners turn out and make fair wages washing in the ravines and old gravel-beds. At the present time quartz mining takes the lead, and for quartz it is wonderfully prolific. There are quite a number of mills.

Passing over from Copley, you first reach the Hart & Flemming mine and mill. Copley is a railroad station and is one of the depots for Squaw Creek. There is here a postoffice, telegraph and store, also hotel, both of the latter being kept by W. W. Nickols, an old Nevada Co. man. Mr. Nickols knows all about the mines, and can tell you where you can find a good prospect for a fortune, and will put himself out of the way to accommodate you, even to the extent of peddling you across the river, as he did your correspondent, because he asked too many questions.

The Hart & Flemming mine is a fine property. The ore carries about one per cent of sulphurets, which are very rich in gold—and free gold as well. The lode is opened by several tunnels, the upper ones, however, being about worked out. The lowest tunnel gives a development of near 500 feet below the crown of the mountain, and is the lowest work now in the district, and rather settles the point as to the lode going down. As to the matter of the lodes going down—where do they come from? If from below, why not go down? No matter which theory is accepted, that of fire or water, the commencement must be below.

The deeper they have gone on this lode the better it is; the lode varies from two to eight feet in width. The mine at times furnishes very rich specimens of gold and sulphurets.

The mill consists of a Dodge pulverizer and two of Hendy's Triumph Concentrators. They work very coarse, using about No. 30 screen; they work thus mainly for concentrating; most of the ore and all the concentrates are shipped to Selby's Works. There is nothing about this ore, as I see it, that should prevent its being worked on the ground. The fact that most of it will bear shipment expenses is a good card for the mine, but the fact that they do ship is not so good a card for the owners, but that is their business.

There is one remarkable feature connected with this property. It belongs to and is superintended by two preachers. How a preacher can run a quartz mill and mine, and not at times do some tall swearing, will puzzle many superintendents. At the time of my visit Mr. Hart was absent, but Mr. Flemming, by his very courteous manner, impressed me very favorably as an intelligent gentleman.

Next on the line is the Mammoth mine, now bonded to Myers & Co. of San Francisco, who are doing prospecting work prior to purchase. This lode is large, being from 6 to 16 feet in width; there is any amount of quartz, and some of it looks well. They are running a tunnel and are in some 700 feet, which will give some 200 feet of backs. Some mills stop for the want of quartz, but the owners of a 40-stamp mill here would never live long enough to see the last of this. As to the value of the quartz, that can speak for itself.

The view from these high ranges is very fine, all rugged and broken, and all more or less timbered with scrubby oaks and pines, etc. It looks as though it were made for mines.

FATAL RAILROAD ACCIDENT.—On Friday of last week an engine and one car of the South Pacific Coast R. R. Co. ran off the bridge at Oakland creek, through the open draw, and 13 persons were drowned. The coroner's jury charges the engineer with manslaughter and censures the company for not adopting proper measures of safety in the matter of signals at the drawbridge.

THE WELLINGTON COAL MINES.—Advices from Victoria, B. C., are to the effect that the situation at the Wellington mines remains unchanged, and the prospects are that the mines will be closed down indefinitely. The steam collier Costa Rica, which depended upon the mines for a cargo, is doing nothing. Her crew, including the captain, have been paid off and discharged.

CEDEOS ISLAND ORE.—The steamer Pomona brought to San Francisco this week from San Diego 100 tons of ore taken out of the mines on Cedros Island, off the coast of Lower California. The mines on this island have not been worked for a number of years until a short time ago, when they were again started. The ore was shipped to San Diego by the steamer Carlos Pacheco.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 5, 1890.

General trade was only fair the past week. The unfavorable influences heretofore reported—tariff and silver legislation—are still felt. The light supply of near-by and spot tonnage is also cause for conservatism, owing to the belief that wheat will move slow for the first three months of the new-crop season, which will make close collections.

The money market continues easy, but there is a growing impression that there will be considerable stringency in August and September, owing to the demand for crop purposes and the light return remittances until toward the forepart of October. Considerable money is being disbursed for improvements—building, etc.—in this and adjoining cities, and liberal disbursements are being made for railroad building, repairs, and other interior improvements.

The steamer leaving here for Hong Kong, June 4, took out \$307,632 in Mexican dollars and \$13,727 in gold coin.

MEXICAN DOLLARS—There was a fair demand for shipment by the last outgoing steamer to China. The market has held steady at 80¢@81c, closing firm.

SILVER—Adverse and bear reports regarding prospective silver legislation had an unfavorable influence on the market at the East and also in Europe. Although everything was done to depress the market, bimetalists did not lose faith, but on the contrary felt more confident that the unfavorable criticism regarding the possibility of no silver legislation would be the means of bringing about a free coinage Act. Our Washington advices indicate that a vote in the Senate on the silver bill will probably be reached during this month, and that in July the bill will be passed. It is confidently asserted that Congress will not ignore the demand of the country, which is unmistakably in favor of free coinage. With free coinage in this country and the Comstock mines yielding nearly all gold, it will be only a short time before the European Governments will fall into line and favor bimetalism. It is asserted by those who should know that European capitalists reading the signs of the times are investing in mining property in this country. A private letter from J. B. Farish, mining engineer, Denver, Colorado, states that he is kept exceedingly busy in reporting on mines, and that English capitalists are paying more than ever before. This shows the present drift of affairs. It is claimed that the Rothschilds have been investing on this coast.

In the local market silver shaded off to \$1.03, then to \$1.02½, but at the close the tendency is upward under higher prices abroad. Exporters named \$1.03 to-day, which would cause the Mint to pay more on a firm selling offer.

Private cables received to-day from London quote silver at 47½d, which is quite an advance on yesterday's price of 46½d. New York came through at \$1.03½.

QUICKSILVER—Receipts the past week aggregate 223 flasks, and exports by sea 30 flasks to Auckland and 58 flasks to Mexico. The market continues firm. The home or coast consumption is reported large.

LIME—Receipts the past week aggregate 6380 bbls., and exports 50 bbls. to Honolulu. The demand shows a slight increase. The market is easy.

BORAX—Exports by sea the past week aggregate 63,780 lbs. to Liverpool. The market is barely steady. Some concessions are reported to large buyers.

ANTIMONY—The local works are running to full capacity and turning out about 750 lbs. a day. The market is easier under better supplies.

IRON—The market is overstocked, but large holders are not disposed to make much if any concessions. The consumption is enlarging. The East and Europe report firmer markets. Imports the past week aggregate 250 tons from New York.

LEAD—The market holds strong. Our Eastern advisers report consumers buying in a small way, but holders are firm in their views. The speculative movement was, at last advices, less pronounced.

TIN—The market continues strong, with a good home consumption. The quantity used this year will not vary much from that of 1889. The East reports an uncertain, hesitating market, yet the tone was steady. English cables report plate active, with the market stiffer.

COPPER—Exports by sea the past week aggregated 31 ingots to Hamburg. The home demand continues free at full prices. The East is reported as follows: The consumptive demand is represented as being phenomenal, and absorbing the product of the mines so closely that the mining companies or other holders will consider offers at the last prices quoted where deliveries further ahead than August are asked for. Quite a large block of Arizona ingot has been disposed of at \$13.90@13.95c, and 14c is now a strictly inside price for that class of material. Common casting brands were sold at \$13.35@13.40c during the week, but at the close 13½c seemed to be the lowest at which any could be secured. Our private cables state that French holders are still realizing in the foreign markets, but prices there continue to advance, and merchant bars are up to \$14.55@14.60c in London.

COAL—Imports of coal the past week aggregate as follows: Coos Bay, 150 tons; Seattle, 4560; Comox, 4300; Tacoma, 4000; Newcastle, N. S. W., 3325; Nanaimo, 1300; Kobe, 1750; Departure Bay, 2260; total, 22,595 tons. The market for spot is steady at unchanged quotations. The demand for steam is active. The strike in the Wellington mine is still on. For Australian, importers' views are strong, but buyers do not appear disposed to operate much for distant shipments unless offered concessions. Some offer \$7. Importers ask more, by from 12½c to 25c a ton.

Always Take a Receipt.

Subscribers to this paper are earnestly requested to take a receipt for every payment made on subscription, no matter how small the amount or to whom paid. We use printed receipts, with stubs attached, to prevent mistakes, through carelessness (or other reason), by agents or others. For our mutual interests take a receipt, whether you preserve it or not.

Mining Share Market.

The market opened weak on Monday, and under fair selling by the outside public, prices shaded off up to Tuesday morning, when a better tone set in, with a demand for Potosi and Bullion. Wednesday witnessed more activity, with Potosi and Bullion still climbing. Following in their wake came Exchequer, Chollar and Savage. The remaining stocks did not show much activity, but strengthened slightly in sympathy. There were unmistakable signs that the pool was still in the market, for notwithstanding bull points on the street, they were not able to sell but hard to buy, so as to sustain the market and advance quotations toward the close. The market has a healthy look for an upward move, but how much, the writer can form no idea, not being on the inside. The upward move is based on concentrated stocks and assessments to be collected preparatory to others later on.

In outside stocks, dealing the past week was light in the Tuscaroras, but at steady prices. In the Bodies, nothing was done. In Peer, Central, Crocker and Peerless of the Quilotoa group, trading was also light. Judging from appearances, it looks as if a movement is near at hand in the Tuscaroras under the new control, for Grayson Sr. should do something in that direction in consideration of giving his son so many secretarieships; besides, the roads in that district are in good condition, and summer is when they generally deal the stocks.

This week's official letter from Hale and Norcross reports running into porphyry and quartz carrying some water. This acknowledgment of a strike, even if it is water, must be a source of gratification to stockholders. If some of the superintendents could be induced to carry some water, perhaps we would have more intelligent reports from the mines.

From the Comstock mines our advices contain of the most gratifying character. Drifts and crosscuts are the order of the day. It looks as if several of the mines are being put into position for better working, perhaps to show up the ore body found to the west. While we are not able in this issue to give any particulars further than heretofore published by us, yet our correspondent is more hopeful than ever of the result. He states that it is the intention to sink the Potosi winze to the 1100 level before drifting. In sinking this winze this stock will be more of a gamble than ever, for the character of the ore in the winze is liable to change every few feet. If, in sinking, the ore should be richer and wider, then the proposition is for a mine; but if poor ore and porphyry come in, then future work only can demonstrate "what is what."

Work from the Ward Shaft is being vigorously

pushed. From a reliable source we are advised of an important strike on the 500-foot level in Hale and Norcross. Another equally as reliable party states that on the 1200-foot level in Chollar they have a large ore body averaging across its face \$40 a ton. The official letter from Savage reports that the 1300-foot Hale and Norcross drift has been extended 20 feet into the former's ground and was in a fine body of quartz giving from \$7 to \$16 assays. The official letter from Belcher reports active prospecting of a promising character. In Challenge, Confidence and Cons. Imperial, similar work is being done, with favorable results looked for.

Our correspondent speaks very hopefully of the work going on in the North End mines, and predicts something important in that group. The official letter from Overman reports that they milled, last week, 1176 tons of ore at the Brunswick mill, giving \$21.31 battery assays, of which \$13.84 is in gold; and 64 tons milled at the Vivian mill gave \$24.04 a ton, of which \$14.98 was gold. They shipped three bars of bullion on May 19 and 22, valued at \$13,769. The increased crushing at the Brunswick mill proves that our statement that 40 stamps would drop on the Overman ore was correct. It would be singular if Overman should pay a dividend. Important work is going on in Seg. Belcher and also in Caledonia.

Boise City, Capital of Idaho.

Now that Idaho is about to be admitted as a State, the people of the State are known to be the third richest precious mineral-producing State, its output being seventeen million annually. But it is not so generally known that Idaho has a delightful climate, is a stock-growers' paradise, and a great farming and lumber producing country. Special attention is called to the card of the Board of Trade, Boise City, Idaho, in another column, soliciting capital and skill to develop their resources.

Utah's Mines.

The Real Estate Exchange of Salt Lake City, Utah, desires to enter into correspondence with Mining Men and Capitalists. The purpose is to encourage the development of the mining interests of Utah. For years the output of Utah mines has been light to ten millions per annum, and the field is not much developed. A point made is that native coal now produces the coke used, a very important item. It is encouraging to outside capital that Utah reaches out a helping, friendly hand. Detailed information will be freely furnished on application to the Real Estate Exchange of Salt Lake City.

BOISE CITY, CAPITAL OF IDAHO.

Metropolis and by provision of Constitution Permanent Capital. Unusual opportunities for investment and business. Capital needed. Mortgages net 10 percent. Saw mills, brick kilns, woolen mills, iron works wanted. Unlimited water power. Best society schools, churches, perfect climate. Stock growers' paradise. Free Government Land. Gr. at grain, fruit and vegetable country. Field crops net \$25 p acre. Idaho, "Gem of the Mountains," will soon be a State. Third in precious minerals. Output last year, \$17,000,000. Combine business with pleasure and visit us. Excursion rates.

IDAHO, "GEM OF THE MOUNTAINS."

Idaho's rapid increase in late years in mineral production is due to the scientific methods formed by capital and long experience. There is large opportunity throughout the mining districts of Idaho to develop mines with almost the certainty of large profits. Gold bullion is cashed at the Government assay office in Boise City. At the same time no mining field offers more attractive inducements to the hardy miner whose capital lies chiefly in his experience and in his pick. Full and complete information concerning Idaho mines will be mailed on application.

IRRIGATING CANALS.

Another great opportunity for capital in Idaho is in large irrigation enterprises. Projects are on foot to reclaim several hundred thousand acres, but there is room for many other such projects. Idaho has abundance of water, and the profits of irrigation are large and sure. For further details address

BOARD OF TRADE,

Boise City, Idaho.

FOR SALE—AN ONYX MINE IN SAN Bernardino County, only about three miles from Railroad. Down grade from mine to the road. Price, \$5000. NOLAN & SMITH, 34 North Spring Street, Los Angeles, Cal.

Assessment Notices.

ACME MILL AND MINING COMPANY; Location of principal place of business, San Francisco, California. Location of Works, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of March, 1890, an assessment, No. 10, of 3 cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of May, 1890, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of June, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

The delinquent day of the above assessment is hereby POSTPONED to June 2, 1890, and this day of sale to MONDAY, June 23, 1890.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
San Francisco, May 15, 1890.

GRAY EAGLE MINING COMPANY, Location of principal place of business, San Francisco, California. Location of Works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of May, 1890, an assessment, No. 17, of five (5) cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of June, 1890, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 30th day of June, 1890, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. M. BUFFINGTON, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

DELINQUENT SALE NOTICE.

GOLD HILL MINING COMPANY—Location of principal place of business, San Francisco, California. Location of works, Grass Valley, Nevada County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 9) levied on the 17th day of April, 1890, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Directors, made on the 17th day of April, 1890, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Company, Room 20, Phelan Building, San Francisco, California, on TUESDAY, the 10th day of June, 1890, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

C A CROW, Secretary.
Office, Room 20, Phelan Building, San Francisco, California.

A MIDDLE-AGED MAN BY THE NAME OF JOSEPH A. McLEARN, Miner, left Nova Scotia 17 years ago for California. His friends would be thankful to any person who could give any information concerning his whereabouts.

SALT LAKE CITY!

ONE OF THE GREAT FIVE.

New York, Chicago, Denver, Salt Lake City and San Francisco.

Midway between Denver and San Francisco, 700 miles from either, with no rivals north to British Columbia or south to Old Mexico, Salt Lake City is destined to become one of the great overshadowing commercial centers in the chain between New York and San Francisco.

The recent mighty inflow of the best American blood has doubled her population, begun the development of untold resources, built up strong churches of a leading denomination, created charming social conditions, fostered the public school system, directed municipal improvements and opened the most profitable business investment, manufacturing and mining opportunities ever presented by a city that in three years will contain over 100,000 people, and before the end of the century several times that number.

MORE MINING CAPITAL NEEDED.

The resources of Utah as a mining region may be shown by the following from the books of the **ONTARIO SILVER MINING COMPANY, Park City, Utah** (near Salt Lake City):

Dividend paid, No. 168, to April 1st, 1890 \$10,850,000.00; ore and bullion sold to April 1st, 1890, \$24,121,203.13. Incorporated January 1st, 1877. Capital Stock, 150,000 shares; par value of stock, \$100.00 per share; market price of stock, \$45.00 per share and upward. Average number of men employed, 425. Value of improvements and property (inventory December 31st, 1889), \$2,935,354.77.

The Company pays regular monthly dividends of \$75,000.00 or 50 cents per share. Utah has numerous dividend payers on a large scale. There are many other mines that are partly developed that promise the richest returns, with sufficient capital. Within three months, coke from our own home coal (Castle Gate) has supplanted foreign coke in our lead smelters.

Salt Lake City is now one of the most delightful homes in the world, with a perfect climate, good society, churches and schools, 50,000 population and growing rapidly. We will be pleased to correspond with mining men a capitalists and point the way to some specially inviting fields. We have many mining capitalists here, who will cordially meet and aid new men. Our field is large, there is room for all. For illustrated pamphlets, summer tourist rates, and specific information, address

Real Estate Exchange,
SALT LAKE CITY, UTAH.

—THE—
**PERFECTED
DOUBLE
Economic
Quartz
Mill.**

Attached to each Mill
is an effective
**Automatic Ore
Feeder.**

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz Mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours; that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient Mill for prospecting, or for a small mine, it fills the bill.
Yours truly,
JAS. S. REYNOLDS,
Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

TATUM & BOWEN,

34 and 36 FREMONT ST., SAN FRANCISCO, CAL.,
AND PORTLAND, OREGON.

SAN FRANCISCO, CAL.

SQUARE FLAX PACKING,

Manufactured from strictly first-class flax and pure lubricants. Superior to all others for water and steam. Packs with less friction and makes a tighter joint than any other packing made. It is a limitation of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center of its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. **W. T. Y. SCHENCK,** Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (36"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

RUPTURE AND PILES.

We POSITIVELY CURE all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. TENDS NO CURE, NO PAY, and NO PAIN until Cured. If afflicted, come and see us or send stamp for pamphlet. Address:

AGENTS FOR THE PACIFIC COAST OF

BRYAN'S ROLLER QUARTZ MILL.**NEW COMMON SENSE STEEL WHIM.**

All Complete for \$150.

No cog-wheels or clutches to break. Ninety per cent of this Whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. The Brake sets itself when the horse stops or anything gives way.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "husted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation. We also make Two, Four and Eight Horse Power Whims, Derrick Whims, and Building Hoists, Ore Buckets, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

Varying from the fraction of 1 up to 15 and 20-horse power. Unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR ADDRESS AS ABOVE

"Sensible" Horse Power Hoisting Whims.

These Hoisting Whims are built entirely of Iron and Steel, mounted on a heavy base plate, and, consequently, are very durable and cannot be affected by extremes of either cold or heat or climatic influences.

The hoisting drum is completely under the control of the person in charge of the hoisting or lowering through the shaft of the mine.

As the drum is entirely independent from the driving gears, the operations of hoisting, dumping bucket and lowering can be performed with the horse in constant motion, a feature not possessed by any other horse hoist in the market and one that greatly increases their capacity by avoiding the loss of time due to stopping and starting the horse.

They are very light and compact, and can be packed for transportation by mules. Their cost of erection is very slight; two men, in half a day, being able to put one in place, ready for work.

With each Whim, working drawings are furnished showing in detail the proper construction of Gallows Frame and foundation for Hoisting Whim.

We carry in stock the following sizes:

No. 1.—Capacity with One Horse and Single Line, 800 pounds, 75 Feet per Minute.

No. 2.—Capacity with One Horse and Single Line, 500 pounds, 125 Feet per Minute.

Weight of machine, 1200 pounds. Total shipping weight, including Sweep, Levers and Sheaves, 1400 pounds.

Retorting and Melting.

Cuts on this page illustrate a single retort with melting furnace for bullion in the same setting. Amalgam is placed on trays in the body of the retort, and as quicksilver is vaporized, it passes through the nozzle into the condenser, from which it flows into a receiving tank. Connections are made with the water-jacket of the condenser, so there will be a constant circulation of water while retorting. When all the quicksilver has been driven off

by the heat, the gold and silver will be found in a spongy mass ready for melting. This is done in the melting furnace, the gold and silver from the retort being placed in a crucible, and, after being melted, it is poured into a bullion mold, from which it is taken, cleaned, and made ready for shipment.

When desired, two or more retorts may be placed side by side in the same setting, having flues running to one stack, as shown in other cuts on this page. The melting furnace for bullion is usually built in with the retort set-

ting both for convenience and to save expense.

Engravings are also presented showing M. P. Boss' improved bullion melting furnace. This improved furnace is operated on the principle of an ordinary forge. The pan constituting the bottom of the furnace should be filled with a mixture of bone-ash and fire-clay, thoroughly tamped down and then scooped out, leaving a lining about two inches thick of the mixture over the entire inner surface of the pan. On top of this and confined by a wrought-iron basket or grate, charcoal and bullion are placed. As the bullion melts, it percolates through the charcoal to the bottom of the pan, and as it accumulates here it is to a certain extent refined by the absorption of the base by the bone-ash lining. The melted bullion is drawn off directly into moulds by tapping the discharge spout

(Concluded on page 400.)

BOSS' IMPROVED BULLION AND MELTING FURNACE.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Mines of Calaveras County.

Sheep Ranch.

[From Our Own Correspondent]

The Sheep Ranch mine is running steadily. This mine is down 1100 feet on a six to seven-foot vein. The property has been worked for many years, and is owned by Mr. J. B. Haggin. Report has it that Mr. Haggin has stated that it paid \$80,000 a year net. Mr. W. Clary is superintendent. While in the engine-room, I was shown a model of an engine with a new valve-motion, the invention of Mr. A. N. Pos, the company's machinist. Mr. Pos is building his model for the Mechanics' Fair, where interested parties will have an opportunity to examine the peculiar mechanism of this independent valve-motion. Mr. Pos is also the inventor of the indicator used at the mine hoist. I have seen no indicator that was as simple or more effective than this. The mine engineer informed me that in the seven years that it had been in use, there had not been a single mistake.

While the Sheep Ranch is the only mine working in the camp, there are a number of other properties in the vicinity that only need capital to bring them to the front. Mr. C. Rodaseni of Mountain Ranch is the owner. The Tom Smith has a tunnel 300 feet long cutting the 2 to 3 foot vein 150 feet deep. One hundred and fifty tons of rock have been crushed; 90 tons at the Sheep Ranch mill, which gave \$14 a ton, and 60 tons at Woods' mill, which yielded \$20 a ton.

The Chas. Anderson has a shaft 80 feet deep on the one-foot vein. This is the same vein as the Sheep Ranch mine. All of the vein matter prospects, and in depth would no doubt swell to the size of the vein in the Sheep Ranch, as the Sheep Ranch vein was not as wide at the same depth.

Mt. Ranch or El Dorado.

Here Mr. Rodaseni has several mines. The Gaston Hill has a shaft down 103 feet, with a drift from the 80-foot level 75 feet long. The vein runs from six inches to four feet; 50 tons milled from the vein, which gave \$15 a ton. The Rose Hill is another of Mr. Rodaseni's properties. This has a 170-foot shaft and a drift 800 feet long on the vein. The drift is run from the hillside to connect with the shaft. The vein crops 20 feet wide. In the bottom of the shaft the vein is 18 feet wide. This ore milled \$4 50 a ton in free gold; rock carries ten per cent of sulphurets, assaying \$69 to \$400 a ton, not saved. Another tunnel of 1000 feet on the vein shows an 18-foot vein; no ore milled from this level, which cuts the vein 460 feet deep, and can be continued on the vein and 120 feet more slope secured. Ore in this drift is heavy with sulphurets—U. S. patents. All of these mines are for sale.

Glencoe.

Mining is very quiet here. The San Pedro is driving a tunnel to crosscut the ledge. The vein is opened to a depth of 250 feet and levels run 225 feet on the 5 to 7 foot vein; 221 tons crushed averaged \$27.83 a ton; vein is called "a seven-foot vein of \$8 rock" by the owner, G. W. Monroe. The Glencoe Con. mines and mills are idle.

West Point.

The Lone Star mine is owned by Wisconsin parties. The mine is on the north fork of the Mokelumne river, three miles northwest of West Point. Mr. Geo. L. Brown, formerly of the Lockwood, is superintendent. The mine has a new 20-stamp mill crushing 2½ tons to stamp; 700 feet pressure requires but 30 inches of water to run breaker, stamps and fine concentrators. There are two parallel veins about 75 feet distant from each other. The veins run from 3 to 16 feet in width, all in granite. The tunnels tap the vein 550 feet deep. The ore is largely sulphurets. Some of it goes as high as \$625 a ton. The mill has run two months. As this is the best plant that has ever been erected in West Point, the people of the town hope for great things from it.

The Tom Paine mine is now the property of Mr. G. A. Billings, formerly of the S. F. Post-office. Mr. Billings has the shaft down 100 feet and a level out 60 feet, showing a four-foot vein; 47 tons milled gave \$35 a ton in free gold, besides the large per cent of sulphurets, which give \$60 to the ton. Mr. Billings is not skeptical in his faith, but is a true believer that the Tom Paine will pan out well.

The Blazing Star. C. J. Moore, superintendent, is now down 275 feet on a vein running from 2½ to 3 feet, which mills \$26 to \$60 a ton from the refuse ore left from sorting, the richer ores being shipped to the Selby Reduction Works, and realizing as high as \$2000 a ton. The mill was burned down this spring but has been rebuilt, and everything is now in running order.

The West Point Chlorination Works are now in charge of Mr. C. Wilson, chlorination and pan process; charges \$20 a ton.

Bonanza Gravel Mines.

This property is on the Amador side of the forks of the Mokelumne river, about five miles north of West Point. The claim is an old river channel 100 feet above the present river-

bed. The storm destroyed almost the entire plant, but a short run has brought the lucky owners out even. The gold is of the same character as that at Forest Hill—cucumber to pumpkin seed in size and appearance. Mr. J. Buhlert of West Point is the owner. It is a difficult thing to say what the future has in store for West Point. The residents are firm in the belief that in depth the mines would all prove valuable. That there is rich ore is not doubted. So far the most of the work has been of a prospecting character—\$5000 to \$20,000 taken out here and there and the vein abandoned. The Lone Star, Blazing Star and San Pedro promise to force up the camp. The Lockwood is working a small force of men in development, but as I could not find the superintendent I cannot say with what success.

West Point has been avoided on account of the want of good hotel accommodations. Heretofore the traveler was compelled to put up with what was offered. Now the Mountain View House and the rooms of Mr. J. Buhlert make a visit to West Point a pleasure instead of an affliction.

E. H. SCHAEFFLE.

The Mesquite Bean.

[Written for the PRESS by C. R. ORCUTT.]

One of the most useful and characteristic of the trees indigenous to the southern-Mexican—borders of the United States is the mesquite tree, also known vernacularly in some localities as the Cashaw, or Algeroia tree.

According to Dr. V. Havard of the United States army, this tree constitutes the principal growth of the wooded tablelands and high valleys throughout South and Southwestern Texas. It extends westward through New Mexico and Arizona to San Diego, California, and is found to the southward through Mexico, Central and South America to the southern parts of the Argentine Republic (exclusive of Patagonia).

Prosopis dulcis (Kunth) is probably the correct botanical name of our tree, though it is usually called *Prosopis juliflora*, D. C., by American botanists. *Algarobia glandulosa*, *Prosopis horrida*, *P. juliflora*, *P. siliquastrum* and *P. glandulosa* are either synonyms or mere varieties, according to Bentham.

The mesquite is frequently nothing but a thorny, straggling shrub, growing in large impenetrable thickets near the coast or over the sandhills of the Colorado desert. Elsewhere, in less exposed situations, it becomes a low, wide-spreading tree, 20 to 30 feet in height, with a trunk seldom over a foot in diameter, although sometimes found from two to three feet in thickness.

In the arid regions, where this tree is found in its best estate, this tree is most useful for the excessively hard, durable wood, valuable for fuel, in fencing or for other uses. Mesquite posts and rails are but slightly affected by exposure to the influences of ordinary weather. The trunk and roots as well as the unbranched sections, from California to Texas, is the most common, often the only obtainable, fuel. The wood is also useful in cabinet work, being heavy, fine-grained, and taking a fine polish, when it has the appearance of mahogany. It is richly covered, varying from purplish-black in the center to a reddish-brown and yellow near the bark.

The tree is also adapted for live fences; of rapid and easy growth in situations where scarcely any other tree will thrive, it can be made to form impenetrable hedges in a few years from the seed.

Baron von Meller says: "The variety *glandulosa* exudes a gum not unlike gum-arabic, and this is obtained so copiously that children could earn two to three dollars a day in gathering it in Texas, latterly about 40,000 lbs. being bought by druggists there."

On the other hand, Dr. V. Havard in speaking of the mesquite tree of Texas, says: "During the summer months the bark secretes an amber-colored gum which has the taste of gum-arabic, and like it makes excellent adhesive mucilage. Its solution in water is slightly acid and astringent; it is a useful and palatable drink in the diarrheas of children. The quantity of gum secreted by each tree is not large enough to make it an important article of commerce."

In California I have never observed the gum in any quantity. I have collected specimens of this gum that closely resembled jet in color and very hard when found—evidently caused to exude by fire.

The tree produces abundantly of its long and slender bean-like pods, with a thick and spongy mesocarp, sweetish to the taste. These pods contain from 25 to 30 per cent of grape-sugar, 11 to 17 per cent of starch, 7 to 11 per cent of protein; of organic acids, pectin and other non-nitrogenous nutritive substances 14 to 24 per cent. They are also comparatively rich in potash, lime and phosphoric acid. The pods of several varieties are said to be rich in tannic acid.

Containing, as they do, more than half their weight in assimilable nutritive principles, these pods constitute a valuable article of food, and are one of the staples with many Mexicans and Indians. The Cahulla Indians, and also the Cocopas of the Colorado desert region in California, gather large quantities of the pods annually, the time of harvest lasting from June into August, when the trees are frequently loaded with their golden wealth.

The squaws go out into the groves and bring back their "hotls" (a large coarse-mesh sack, resembling a hammock) and baskets full of the yellow pods. They then grind the pods in their stone mills, or "matates," into a coarse meal or flour, remove the seeds and hard shells around the seeds, and then cook to suit their taste. Sometimes they boil the flour in water and make a gruel or pudding, but the larger portion of the meal goes to form large, flat cakes or loaves of bread which may be made to supply food for many months to come, and are easy for the nomadic tribes to transport.

This bread is very sweet and pleasant to the taste, with a pleasant, slightly acid and astringent, spicy flavor. A sparkling drink, called *alcija*, is also made from these pods. The Comanche and Apache Indians formerly used large quantities of an alcoholic drink—a weak beer—made by fermentation of the flour.

The mesquite beans (as the pods are commonly called) are relished by most herbivorous animals, and horses and cattle will eat them with avidity and thrive on them as a substitute for grain. They are likely to be more largely utilized as fodder for stock than as human food.

In this connection, it is worthy of note that the pods of the mesquite produced in the valleys near the coast are almost invariably thin and bitter instead of thick, sweet and nutritious, as are those grown in the more arid sections on the Colorado desert and eastward. Evidently a warm, dry climate is necessary to the best development of the fruit, the fogs and coast winds causing a very inferior product. The delicate green, finely divided foliage renders this a very beautiful tree when in leaf, and it is well worthy of being extensively cultivated.

San Diego, Cal.

Hidden Dangers in Dam-Building.

EDITORS PRESS:—In the construction of water-storage dams there is an element of insecurity to be guarded against in some cases, which does not seem to have been publicly noticed. I refer to the swelling of the ground under, or near to, the dam-building.

A valley or wide ravine with a slight descent, and having side-hills coming near to each other at its lower end, is economically favorable for water-imponnding purposes, provided that the collecting surfaces above are large enough to insure the supply required. In the arid regions such a valley is usually so dry that, on the side-hills at least, the general water level can only be reached by deep sinking. If solid primary rock, with little permeability, is available in founding the dam, its bulk, when submerged, will not increase; but if dependences are placed on a stratified formation containing layers of clay, talc or shale, its expansion when exposed to pressured water must certainly be expected. Every old miner has had trouble with swelling or "oreeping" ground, and builders of escarpment walls are aware how hard it is to keep some kinds of rock in place during wet weather.

Assuming that a dam has been built on an unstable foundation of the kind described, what will the effect be when a pressure of 50, 70 or 100 feet of water comes upon it? The whole "country rock" above the dam will, in the center of the ravine especially, both underneath and outside of the dam-building, be saturated to a great depth. Under the abatments on the converging side-hills the pressure will be less, yet every pore and interstice will be filled. Should there be the slightest tendency of this water-charged rock to expand, either laterally or vertically, it is easy to understand how even a dam to itself well planned and carefully built may in time give way owing to such expansion.

The sapping and weakening effects of water percolating under high pressure may go on for years without being noticed, but if the dam erection is ultimately, though it may be imperceptibly, lifted or compressed by the slow swelling of the ravine or hillside formations, so that cracks and veinlets are formed in or beneath it, increased pressure may suddenly destroy it.

The wearing or mechanical effects resulting from a sweating process going on in a dam, or the rock underlying it, is not the only evil which is to be feared. The air acting on wet surfaces promotes chemical changes which are followed by disintegration of the affected rocks, and thus slowly yet surely there may be destructive agencies at work where least expected.

Should there be veins of porous rock dipping under a dam from its upper side, the passage of water through such veins may of itself prove a hidden cause of disaster. The escape may be small at first, but a softening and widening work going on for years cannot fail to weaken a heavy dam-building not very far above it.

If I am right in assuming from reasons stated above that the building of dams on some kinds of stratified rocks renders them unsafe, I trust by calling attention to the subject to encourage investigation and the adoption of adequate engineering remedies. It would be some satisfaction to know whether the Johnstown and Walnut Grove dams were built on stratified rocks. If they were affording evidence long before they collapsed, which they did not give when first in use, that cracks had been opened in them, it is reasonable to assume that they had been injured by the expansion of the foundation and hillside rocks.

JOHN DARE EMERLEY.

The Gold Belt of Northern California.

Ancient River Channels and Gravel Deposits.

NUMBER I.

[Written for the MINING AND SCIENTIFIC PRESS by JAMES F. TALBOTT, Shady Run, Placer Co.]

The original purpose of this paper was to direct the attention of mining men to the unexplored and unprospected mining section of country between the North fork of the American river and Bear river, which in my opinion contains an ancient river channel as rich as any in the county, and from which the gold in the hydraulic mines of Dutch Flat and Gold Run had its source. To give my reasons for this opinion, I have outlined my theory of the gravel deposits and old river channels. The paper was prepared a year ago and left at the State Mining Bureau for publication. Owing to some misunderstanding, its publication has been delayed to the present time, when it is given to the PRESS. I was not aware that Prof. Hanks, or any one else, intended writing on this subject till I saw his first paper in the PRESS.

I lay no claim to scientific attainments or literary embellishments, but have aimed to express my views in a practical form; related facts that are obvious, and accounted for all of the conditions, as appears to me, by the most reasonable and natural methods. With deference to Prof. Hanks' scientific eminence, I protest against his arguing both sides of this question. He is a decade or two behind the age in regard to the miners in this section of country. Some of the authors he refers to as being advocates of the river theory were as visionary as that very limited class of miners who left ounce diggings and rushed to Gold Lake, believing there they would find the fountain-head of the rich deposits below. They possibly had a remote idea of his theory, and believed the lake had been scooped out by a glacier and they would get the coarse gold in its bed.

In point of intelligence the miners of this section of country will compare favorably with any in the State, and it is uncommon at the present time to find one who does not believe in the river theory. They consider it proven and well established from facts made known by developments within the past decade. I have been a firm advocate of the ancient river theory for the past 30 years; have been a close observer of all the conditions and deposits in the deep gravel beds and drift mines. I have stood in the uncovered channel of a hydraulic mine (and handled the pipe) and have swung a pick at the breast of a drift mine in California, and I have not seen or read anything that would cause me to doubt the correctness of it. I have seen nothing in all of my experience and observation within the gold belt, from the Calaveras river to the South Yuba, but what can be satisfactorily accounted for by the action of water and extensive landslides.

Prof. Hanks has failed to show wherein his theory possesses any practical advantage over the river theory in regard to the discovery of new mines, or working those already developed.

That those gravel deposits, channels or basins are here as a fact no theorist will deny; and I think more valuable results will be obtained from a correct knowledge of just how they are, and an examination and study of the conditions and indications that denote their existence in unexplored localities, than any theory about how they came there, however scientific and interesting.

The MINING AND SCIENTIFIC PRESS is the only paper we look to now to bring our section of country into notice among mining men, and through your instrumentality, in the near future, this region will have as great a notoriety for its drift mines as it had last winter for snow during the blockade.

With this brief explanation, I will go on with my paper as originally written, considering, in due course, the hydraulic mines of Dutch Flat and Gold Run, and the prospects of mining in an extensive unexplored and unprospected section of country.

There has been so much written about the "Citrus Belt of Northern California" that, for a change, I propose to write a chapter on the "Gold Belt of Northern California."

This gold belt is on an average about 20 miles wide, extending from south to north, running through the counties of El Dorado, Placer, Nevada and Sierra, in Townships Ranges 10, 11 and 12 east, Mt. Diablo meridian. In some places it extends beyond the lines here indicated, on either side. In no portion of the world has as

Rich Gold Mines

Ever been discovered and worked, in as healthy a climate, with easy access and every facility at hand for working them. In the early days of mining, the richest ravine, canyon and river diggings were found within the limits of this gold belt. From numerous localities, from Hangtown to Downville, on this belt, gold-dust was packed out by the mule-load.

From the character of the diggings and the thousands of miners working them, it was apparent that a few years would exhaust this class of mines. In 1851-52 the miners began to realize the fact and feel the effects of the waning rich diggings.

The accidental discovery of gold on Georgia

Hill, at Yankee Jim's, in the summer of 1851, marked

The Commencement of a New Era

In mining, and started a mining boom as big as the days of '49.

On a point high above Devil's Canyon, on the south side, near the trail leading from Yankee Jim's to Todd's Valley, a large tree was upturned by the roots, and exposed to view some fine gravel and decomposed boulders. A company of experienced Georgia miners were at work in Devil's Canyon and had got big pay in the canyon, just below this gravel point on the hill. They prospected some dirt from about the roots of this tree, got a good prospect, located and worked the first hill diggings in Placer county. No claim of the kind and same extent in the State has produced more gold than this one on Georgia Hill.

When this company worked out their claim and left for the States, they loaded several mules with gold-dust, the proceeds of their work in Devil's Canyon and on Georgia Hill. This discovery excited universal astonishment among the miners; heretofore the richest deposits were looked for in the deep gorges of the canyons and gulches.

Up to this time no particular theory had been advanced in regard to the source of the gold and method of deposit.

The great mystery and all-absorbing topic of the day was to find out how the gold got from Devil's Canyon up on Georgia Hill. Some of the pioneer philosophers of the pick are always equal to any emergency, and they solved the problem in this instance to their own entire satisfaction. They pointed to the admitted fact that the same kind of gold was found on Georgia Hill that was in Devil's Canyon, and that there was but one way by which it could possibly get from the canyon up on the hill, and that was it was "hove up." This "hove-up theory" prevailed for a short time. Every gravel deposit found on the hills had been "hove up there," according to their ideas.

The army of prospectors for hill diggings soon developed the fact that

An Extensive Gravel Range

Extended northward along the western border of the gold belt. Rich strikes were made all along the line south and north. This gave rise to a new theory, the "cross channel." This class of theorists claim that the ancient river channels run across the country on a line with the extensive gravel deposits, and that the modern rivers cut them at right angles. A scientific writer of the times, following in the footsteps of the practical miner as strikes and developments are made northward, thus expresses the ideas of this theory. Of Placer county he says: "It is traversed from south to north by one of the most extensive auriferous gravel leads in California. Commencing in the south at Todd's valley and extending northward through Yankee Jim's, Wisconsin Hill, Iowa Hill, Indiana Hill and Gold Run, from Gold Run the channel bears northeast to Dutch Flat; here it makes a short horse-shoe curve and turns directly to the westward and enters Nevada county at Little York." There is a wide difference of opinion among the advocates of this theory. One portion claim that the grade of the channels was originally from south to north, while in places where the bedrock has been reached and worked to, the present grades show this to be impossible. They tell us the bedrock has been "hove up." The other portion contend that the channels ran from north to south. Both parties arguing from the same premises, point to the admitted fact that certain gravel deposits, channels, and the gold in them, are identical in Sierra, Nevada, Placer and El Dorado counties. A direct, imaginary connection is made between points 50 or 100 miles apart, over high, barren, bedrock ridges and deep canyons, where for miles there is not a vestige of gravel or a color of gold. This theory is but little better sustained by existing facts than the "hove-up" theory, although there are many good practical miners who still adhere to it.

This is an outline of the principal theories that prevailed in this section of country until the winter of 1852-53, when a company of miners working near the head of Jenny Lind canyon, south of Forest Hill, had their claim and tools covered up by a big slide from the hill caused by the heavy storms of that winter. After the storms let up, this company commenced washing off the slide to clear their claim of the debris and recover their tools, when, to their great surprise, they found this slide had uncovered a very rich lead of coarse gold and revealed its source. This accidental discovery turned the progressive miners' ideas into the right channel and added many millions to the stock of gold.

Tunnels Were Run in

Through the rimrock for miles above and below Forest Hill and all of them that were low enough struck rich gravel and established the fact that an extensive rich channel was buried deep beneath the lava-capped ridge. These developments originated what I shall term the progressive theory, which will now be considered. It is apparent that some great revolution of Nature has completely changed the condition of things from what they were at some remote period of time, and those extensive lava ridges point directly to the prime cause that produced this great change:

(To be Continued)

Entries on Arid Lands.

There seems to be an effort in progress to get Congress to amend the existing law which prevents the issue of patents for arid lands in view of the proposed action of the Government in building reservoirs or at least in reserving sites for them. The claim is made that

"Not an acre of such land in the great West entered since October 2, 1888, can be patented and such entries, without useless relief, will be canceled. Tens of thousands of acres on existing irrigating canals, actually being cultivated and reclaimed by water from such canals, cannot now be patented because entered since October 2, 1888."

Thousands of bona fide settlers in California, Arizona, New Mexico, Utah, Colorado, Washington, Nevada, and throughout the entire surrounding region have been allowed to enter Government land, are complying with the law as they suppose it to be, and as it has existed, are getting water from constructed irrigating canals, are honest, hard-working settlers, but who would to-day be denied a patent for that same land and are unconscious of the fact.

If the facts are as stated, the hardship is certainly great and the relief measure should receive general attention. How the deplored condition came about is explained in this way:

"It is stated that in drafting the Act of Oct. 2, 1888, which reserves from entry, settlement or occupation certain public lands, the conference committee did not intend to prevent and prohibit the entry and reclamation of lands adjacent to constructed irrigating canals or those in process of construction, but that they did overlook the fact that the broad wording of the Act would have a wide-reaching and disastrous effect not intended or desired by its projectors."

We give these statements as we draw them from a circular which we receive from Chicago, without our indorsement, because we are not at the moment informed upon the truth or bearing of the statements. They commend themselves to the attention and investigation of those who have patents pending on entries made since 1888. We know there are hosts of such entries, and many of them have been made not by actual settlers but by speculators, and we are not sure that the movement we allude to is not nine points for the speculator to one for the hard-working settler, who does not even know what a box he is in. For this reason we counsel inquiry and contributions to our columns from those who are possessed of the facts in the case. The remedy which is proposed is two-fold. One is to repeal Act of Oct. 2, 1888, so far as it might be construed to affect land which can be reclaimed from existing irrigating canals with vested rights, allowing every person who has made entry of lands lying so adjacent to such canals since the passage of said Act to perfect the title to the same. Another remedy is to insert in the objectionable law the following amendment:

"And every person who has made entry under homestead, pre-emption or desert-land laws, of any desert or arid lands lying so adjacent to any constructed canal that the water therefrom may be used for irrigating said land, shall be protected in his said entry, and allowed to perfect the same, subject to the exceptions in this section."

On the face of the matter, it appears merely to give title to lands to those who really merit it, but we have seen so much legislation which accomplished results not held in view by the framers that we apprehend evil from any measure to unsettle the present status of the arid lands likely to be improved by the Government work.

THE CARLISLE MILL.—The person in charge of the Carlisle mill, at Carlisle, has been ordered to take the machinery on a ship to San Francisco, and sell it for whatever it will bring, excepting the 20 stamps leased to John A. Miller. As to this lease, the company has retained counsel with a view of having it set aside and canceled. Geo. W. Eustice, manager and superintendent at the time, executed a lease in behalf of the company to Mr. Miller to 20 stamps, and agreed to put everything in good order for the running of that many stamps. The company desires to avoid this lease, and a hard-fought lawsuit is liable to be the result. It is such conduct as this on the part of alien corporations that brought into existence and prevents the repeal of the alien law. After this company had enjoyed dividends in England from the products of this mine, it should have shown enough liberality when it abandoned the property to let someone take the mill on fair terms, instead of trying to barter the machinery off as old iron. The conduct of the company indicates that if it cannot make money, no one else shall get the benefit of its cast-off property. Hardly gratitude, that. *Southwest (N. M.) Sentinel.*

THE DYES FROM COAL.—No less than 51 distinct substances are found in coal, all of which, though not equal in importance, are largely utilized. In the manufacture of coke, coal tar is a resultant product. The coal tar, upon redistillation, yields, among other things, a large amount of volatile oil called benzole. Hofmann found that benzole, upon proper treatment with certain chemicals, yielded aniline, an oily liquid akin in its nature to the alkaloids, nicotine from tobacco, and conine from hemlock. Hofmann also succeeded in

getting a beautiful dye from aniline by oxidation. This dye is called rosaniline, and from it may be obtained every conceivable shade of color. It is a curious fact that this intense dye is colorless in an absolutely pure state, but on uniting with acids it at once takes on its characteristic vivid crimson color. Since the most important part in the manufacture of these dyes depends upon the oxidation of the aniline, it is necessary to get some common and inexpensive substance for that purpose. Unfortunately for the personal comfort of many people, arsenic acid, one of the most fatal poisons, is the substance generally used. It is due to this chemical that so many of the fabrics dyed with aniline colors are injurious. The dyes in themselves are harmless. The arsenic acid is not essential to the color, but after it has done its duty as an oxidizer, the manufacturer does not take the trouble to remove the poison carefully from the dyes. The suggestion to use other oxidizers that are harmless has often been made, but arsenic acid is in such general use that manufacturers are unwilling to give it up. The only possible check upon its use is stringent legislation.

Cerro Gordo District.

H. M. Yerrington, Sam Jones, Lon Hamilton, Evan Williams, John Ludwig, Colonel W. J. Sutherland of the Candelaria Company, and Captain Hulse of England, who is also largely interested in Candelaria, have made an extensive examination of the mines of Cerro Gordo District, Inyo Co., Cal., and saw developments and promising prospects enough to much more than justify the glowing accounts that have been received from that section. The celebrated Union mine was thoroughly inspected, and its prosperous condition was sufficient to satisfy the experts as to the immense wealth of the district. The appearance of this mine and of other valuable mineral properties aroused so much interest that Messrs. Jones, Ludwig and Hamilton remained a day longer for further examination, while the other members of the party took a hurried glance at the various other important industries of that section. It is pretty well understood that Cerro Gordo is on the eve of a return of prosperity that will cast in the shade the recollections of former days of opulence.

The conditions attending the development of the rich ore bodies of the district have been so changed for the better by the facilities for transportation and reduction afforded by the railroad, that the renewal of activity that has arrived at such a stage as to attract widespread attention is but the legitimate result of confidence in the ability of operators to make a permanently profitable business of handling the ore of the camp—not as formerly, obliged to cast aside any but rock of very high value, the owners are now able to treat successfully the entire yield of the mines, and enforced search for rich pockets will no more cause periods of unremunerative mining.

However, although Cerro Gordo district is the present center of attention, owing to its magnificent promise of large and speedy returns, it is not by any means the only field of important enterprise in Inyo county.

The party with Mr. Yerrington, after leaving the mining district, visited the great soda works at Independence lake, and also the Inyo marble works, where the quantity and quality of the marble surprised those of the visitors who had not previously seen the quarries. It is from these works that the marble used in improvements on the Palace hotel is being shipped.

On Sunday the party reached Candelaria on the return trip, and were there hospitably entertained by Colonel Sutherland and Captain Hulse. Candelaria has again become one of the rushing camps. The energy of Col. Sutherland's management has put the mines in good condition for working, and the excellent prospects have renewed the hurry and bustle of other times. No time has been wasted in the work of preparation; work has been pushed with vigor, and the mill in town will begin crushing ore on the 20th of this month.

The great chain of rich mineral districts extending from Candelaria south is scarcely as yet well understood by the mining world. The extent of territory, value and quantity of ore cannot be realized without a visit of inspection. The abundance of all classes of mineral from free gold to heavy lead ore assures for the country a brilliant future.—*Virginia Enterprise.*

TECHNICAL SOCIETY.—The Technical Society of the Pacific Coast held its regular monthly meeting last week. There was a good attendance, and Professor Frank Soole presided in the absence of President J. Richards. The feature of the evening was a paper read by Professor Irving Stringham on "Napier's Definition of Logarithm and its Consequences." He said Napier's definition was by means of the relative motion of two points in a straight line: the one moving with a constant velocity, the other with a velocity proportional to its distance from a fixed origin. He said this definition led directly to the fundamental principles of the differential calculus, and one of the principal objects of the paper was to show how this connection was made. It appeared from the paper, as read, that Napier was on the threshold of the discovery of the differential calculus more than half a century before the publication of its discovery by Newton.

Big Tree for the World's Fair.

Neal Girard Van Doornom of Cramers, Tulare county, is making preparations to take out a section of a big redwood tree for the purpose of exhibition at the World's Fair in 1893.

This will be the largest section of any big tree ever taken from California. The tree measures 99 feet in circumference, making it 33 feet in diameter. The section to be taken out will be nine feet in height and 60 feet in circumference. It will be divided into three cuts.

The first cut will be one foot in height by 20 feet in diameter. This cut will be split once across, making two half rounds. The next cut will be seven feet in height by 20 feet in diameter, and will be hollowed out, leaving the bark and sap and about four inches of the timber. The last cut will be the same as the first, allowing all the timber to remain and only splitting once. All three cuts will be set up together when on exhibition.

The manner in which this tree will be gotten out will convince the most skeptical of people that this is not misrepresented, but the largest section of any big tree ever taken from California. The World's Fair Big Tree is to be taken from Mammoth Forest, Tulare county, California, which is located 52 miles east of Tulare City, at an altitude of 6325 feet above the level of the sea.

The work of felling the tree has already begun. Ten skilled workmen have been engaged and are busy at work. The saw to be used in getting out these sections is 22 feet in length, and was made to order by the Pacific Saw Company of San Francisco. It is said to be the largest crosscut saw ever made of one piece of steel, and is supposed to require eight men to handle it. It will take ten men at least two months to complete all the work to be done. Considerable time will be required for the timber to dry, as the weight of green redwood is very considerable.

Everything will be in readiness long before the proper time arrives for shipment.

Three flat cars will be necessary for transportation, as the total weight will not be less than 65,000 pounds.

Chinese Miners on Public Land.

The Idaho County *Free Press* says: Since Judge Sweet's decision in the Moose Creek case that Chinese have no right on public land and that the leasing of mining ground to Chinese is equivalent to abandonment of the same, quite a number of people with more or less good intentions—and not a few in the hope of getting something for nothing—have started out to give the Chinese a literal interpretation of the judge's decision by evicting them from sundry claims on Salmon river, Pierce City and elsewhere. The mere fact that a claim has been worked for a number of years is regarded by some enthusiasts as *prima facie* evidence that the ground is very rich. We apprehend that there will be more blasted hopes than gold-dust realized out of the bunk of these claims, and that their owners will be as eager to relinquish as they were to acquire possession of their "mines." With the exception of the Moose Creek, Buffalo Hill and Campbell claims in Elk City, and possibly a couple of the Meadow claims in Warrens, there is no ground of any consequence in Idaho county now worked by Chinese.

The time has gone by when this decision can affect the status of the Chinese placer miners in Idaho county. It was announced 20 years too late. The Chinese have skimmed the cream of our camps over and over again, until the Chinese question has solved itself. When we first knew Warrens, ten years ago, it was a busy hive of Chinese industry. To-day, owing to the exhaustion of the ground, the Celestial population has dwindled away until now they scarcely equal the white men in numbers. Elk City and Pierce City have undergone similar experiences, and the last two summers witnessed a very large exodus of Chinese from this county. May their stay be long.

THE MOUNTAIN LEDGE.—The Mountain Ledge Gold Mining Co. (Limited) of London has recommenced operations on its newly-acquired mining property near Sierra City. Contracts have been let for a 40-stamp mill, tramway and other essentials for a complete plant. This event will stimulate other enterprises, and as this corporation ranks foremost among the English mining companies, there will be no lack of capital to develop the property, which is said to be very valuable, and will consequently prove of great advantage to Sierra county.

SAVING FUEL.—In view of the numerous claims of inventors for saving fuel, a well-known locomotive engineer declares that if he could invent a red patent that would withstand the action of the fire, he would have no difficulty in getting certificates of a saving of 25 per cent in fuel.

GOLD AND SILVER.—The U. S. Sub-Treasury in this city has now in its vaults \$68,073,411.78 in gold and hard cash. Over \$42,000,000 of this is in gold coin and over \$25,000,000 in silver coin. The shipments of silver from the Sub-Treasury during the past month amounted to \$53,705.

MINING SUMMARY.

The following is mostly condensed from journals published to the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BIG CLEANUP.—*Ledger*, June 7: The last cleanup of the South Spring Hill mill, made early in May, was the largest ever made in the history of this famous mine. The yield amounted to \$66,000, including the sulphurets for the month. While the yield would have been a heavy one under any circumstances, still the fact that a thorough cleanup of the plates was made at that time helped materially to swell the figures to the above handsome proportions. The plates had not been so thoroughly cleaned before for several years.

NEW LONDON.—The 40-stamp mill is kept plodding along steadily, eating up about 100 tons per day. It only requires about four hours per day to hoist and deliver to the mill all the ore required for the 24 hours. The Frue concentrators are working well. The mine is unquestionably on a solid paying basis, although the ore is not high grade. About 80 men are employed in mine and mill. The superintendent, H. Reese, to whose judgment and management the development of this splendid property is mainly due, has everything about mill and mine in excellent shape and running with clockwork regularity. Owing to the strong pitch of the ledge south, most of the ore which now supplies the mill has to be run 600 feet to the shaft. To avoid this travel, it is probable that a new shaft will be sunk in the near future some distance south of the mill.

PLYMOUTH CONSOLIDATED.—Twenty stamps of the Pacific mill are kept running. The new ore body struck in the Indiana ground is five feet wide and estimated to mill at least from \$10 to \$12 per ton. The discovery holds out every promise of insuring another long career of prosperity for this famous mine. The development is at a considerable distance south of the Pacific shaft, necessitating running the ore 600 or 700 feet underground. To obviate this difficulty it is probable that a new shaft will be sunk. Messrs. Hayward & Hobart were expected in Plymouth early this week to determine this matter.

AMADOR GOLD MINE.—The mill was started Monday afternoon. As anticipated, considerable trouble was encountered in getting the car-track in order. This track is about half a mile long with a grade of a couple of hundred feet. The loaded down-car is intended to pull the empty car back. As the grade is not uniform, and there are one or more curves to be made, it was soon found that more rollers for the cable to run on would be necessary. These have been sent for, and other defects will be remedied as fast as discovered. It is the general opinion that with a few changes the track can be made to work as intended. J. O'Neil has charge of the mill, with Jas. Mushett running the concentrators.

GOVER.—This mine has never been in such a flourishing condition as at the present time. At the mine they are putting in self-dumping skips, which will be a great advantage in the handling of the ore. At the 500-foot level there is a 25-foot ledge from which the mill is kept running. They are prospecting at the 600 level north and south. In the west crosscut there is a four-foot ledge which is increasing in size as it is driven forward. There is every indication that this mine will run for a good many years to come. Mr. Call has given his greatest attention to this property, and is working the mine to the best advantage. Improvements have also been made at the mill. Four new Woodbury concentrators have been put in, as the other machine did not catch the fine sulphurets, which are very rich in the Gover rock. The machines are run by a separate water-wheel, which is put 12 feet above the machines so that the water that runs the wheel will also supply the concentrators. New mortar blocks have also been put in. A new clean-up room has been erected, adjoining the mill. A coat of paint inside and out gives it a neat appearance. The mill is in good working order and is one of the mills that decorate the mother lode of Amador county.

Calaveras.

FINE ROCK.—*Calaveras Chronicle*, June 7: Some fine rock has been struck in the Occident tunnel of the Sandy Bar M. Co., on the Mokelumne river, this week. The rock is heavily charged with galena sulphurets and carries a liberal quantity of free gold. The ore is good for \$60 a ton. This rock was encountered 200 feet below the surface. The surface ore resembles in every particular the ore 200 feet below, except that it is not so rich, thus leading to the presumption that good rock extends all the way down. The ledge is $\frac{3}{4}$ feet in width, but the rock is not, of course, of the same grade throughout. It is estimated that the whole vein will average a yield of \$10 or \$12 to the ton. A force of carpenters is at work upon the mill pushing it as fast as possible to completion. There is a large supply of rock on hand ready to be put through the mill. The mine bin, with a capacity of about 800 tons, is full, awaiting the completion of the mill-bin to be relieved of its contents.

MORE STAMPS.—*Mt. Echo*, June 5: The Tuloc & Lane management will erect at once an addition of five stamps to the original battery, making ten stamps in all.

Inyo.

SYLVANIA.—*Cor. Index*, June 7: J. C. Crocker, just in from Sylvania mining district, reports everything progressing finely. The foundations for the engine and smelter are completed and the furnace is being put up. Lumber for building the balance of mill arrived Monday and will be shipped out immediately. About 40 men are working at present. Coal pits are up and ready to burn on completion of furnace. Everything in and around the Co.'s works is progressing as well as could be expected under all circumstances, Sylvania being 48 miles from Alford on the C. & C. R. R. We were shown some of the ore to-day and pronounce it the best smelting ore we have seen for several years. It is high up in silver and carries from 35 to 85 per cent lead. It is Ho! for Sylvania now, or bust! The travel to and from there is increasing daily. We hope soon to see the first output of base bullion arrive at Alford for shipment. The company has hoisting machinery on the road which will be erected as soon as possible and

the shaft sunk another 100 feet. They are running tunnels and opening up the mine so as to have plenty of ventilation and mine in good shape for work.

Mariposa.

THE HART.—*Gazette*, June 7: For the past two weeks work has been nominally at a standstill as far as the actual developments of the Hart mine are concerned. The preparations that have been made, however, will allow of much more quickly and extensively carrying out the necessary opening of the mine. It has been demonstrated that the ledge is of an average width of two feet, having gradually widened from the surface where it was but six inches to the present level, 80 feet. The former force of three men has been increased to six, and the quarters for the men have been removed to a convenient point near the works, enlarged and made more of a permanent character than those heretofore occupied. The new whim was completed this week, and work is now being pushed with a vigor, worthy of the ample reward the present prospects surely indicate must result.

Nevada.

A SLIGHT HITCH.—*Grass Valley Tidings*, June 3: The Brunswick machinery is ready to start up and will be in operation in a few days, when differences relative to the contract for water with the Grass Valley Water Co. are adjusted. One day last week a $\frac{1}{2}$ -foot ledge was cut in the second level of the Brunswick. The ledge shows free gold and has a "lively" appearance generally. It has never before been worked. Supt. Fitzgerald regards the find as full of promise and is anxious to sink on it.

Placer.

LOST CAMP.—*Truckee Republican*, June 4: A discovery of gravel placers, rich in gold nuggets weighing from half an ounce to six ounces, is reported in the vicinity of Lost Camp, between Blue Canyon and Emigrant Gap. Rich placer ground was discovered in Lost Camp in 1854, but the prospectors, forced to leave their location to visit Sacramento for the purpose of obtaining supplies, on their return failed to find the locality, hence it was christened Lost Camp. At the date of its first discovery Lost Camp was in a dense forest without wagon-roads, or even trails, leading to it. After the construction of the Central Pacific railroad the ground in the vicinity was divested of timber to furnish fuel and lumber for building purposes, and the auriferous character of the ground led to prospecting, which resulted in the rediscovery of the lost placers.

FOREST HILL.—*Placer Herald*, June 7: At the Mayflower the tunnel has been run 1200 feet in a northerly direction under the old works, and Supt. Beech expects to start the mill in six weeks. Swansborough & Co. have leased the Dardanelles and are taking out good pay dirt. The Breece & Wheeler mine is paying big. The yield for the last month netted the owners \$10,000. Work at the Hogshack is progressing satisfactorily. The tunnel is now 1500 feet in length. The tunnel at the Gray Eagle is in about 1500 feet. The rock is soft and easily worked. Henderson & Pease expect to make a good cleanup in their claim at Yankee Jims, as the gravel prospects well. A. Clark has the iron ore band for some 600 feet of car track at the Wolverine tunnel. Tom Harper is rubbing his tunnel at Sailor canyon, having run about 700 feet this winter.

San Diego.

SHAFT.—*Julian Sentinel*, June 6: The contract for sinking the shaft on the Kentuck S. mine was awarded to L. N. Bailey. Work at the Owens mine is progressing rapidly and operations will be commenced in another week.

Shaeta.

LOWER SPRINGS.—*Cor. Democrat*, June 6: The Ottawa reduction works are almost ready to resume work again. They have changed crushers and now have a Dodge pulverizer. They have, or will have, 100 tons of ore from the Becker mine, located on the Igo road. It is not their best ore but will be a general sample. Sheriff Hopping and Cowen, owners of the Chalk Hill mine, located about seven miles southwest of Redding, have bought 160 acres of land from the railroad company and on this land is some very good placer ground, but the most attractive feature of this property is the Hopping & Cowen quartz ledge. They have taken out about seven tons of ore that ought to mill \$100 per ton free milling, and still more in sight. Near Ladpole, below Centerville, they have three large ledges, all of which prospect very well. One of the three is called the Legal Tender mine, which has \$15-ore in sight. The Pearl mine, in Lower Springs mining district, is having assessment work done for 1890. Some of the ore runs 10 per cent in sulphurets, and assays over \$300 per ton. The ledge will average one foot wide.

REDUCTION WORKS.—*Redding Free Press*, June 7: The reduction works below town are ready for business. The gold is separated from the quartz dust by specific gravity and a system of air currents. Wm. P. Miller of Lower Springs is having a couple of tons worked by way of test. Should this process of reducing ores prove a success, there will be plenty of business for the projectors of the enterprise, and these works will be followed by a smelting plant.

A THIRD TUNNEL.—Mr. Hart of the Texas and Georgia mine says that the mine at Old Diggings is looking splendid. He is driving his third tunnel into a mountain of ore, which is very rich at a distance of 640 feet from the surface.

CASTLE CRAG.—Hufface is down from Castle Crag and says that country is alive with prospectors and that many locations have been made all over the Castle Creek district.

Sierra.

A FAILURE.—*Mountain Messenger*, June 7: The Red Cliff quartz mine, on Kanaka Creek, Sierra county, on which Prof. Barnhardt, from Cleveland, Ohio, with a flourish of trumpets, built a big mill last year, with Eastern capital, without first taking the precaution to ascertain if he had enough pay ore to make a mine, has been attacked by Albert Hotchkiss, who has a judgment against the property for \$638.50.

Siskiyou.

GRAVEL AND QUARTZ.—*Yreka Journal*, June 11: The Black Jack Mining Co., at Cottonwood intend having their hard gravel crushed in Coyle & Jacobs mill, as an easier method than endeavoring to dissolve it in sluices. River miners on the Klamath are busily engaged in getting ready for hoisting

ore. On the 650 level the exploring drifts have reached quartz that is beginning to carry metal.

CON. CALIFORNIA & VIRGINIA.—The 1300 and 1500 levels continue to yield the usual quantity of ore. On the 1435 level, west crosscut No. 3, from the main south drift, 110 feet south of west crosscut No. 1, is advanced 302 feet, continuing in porphyry and quartz showing value. Are still obtaining good ore at several points on the 1650 level. The usual amount will this week be shipped to mills on the Carson river and the average of battery assays will be about the same as last week.

SCORPION.—The southwest drift on the 630 level still continues in a favorable formation composed of a mixture of porphyry and clay.

Eureka District.

ORE SHIPMENTS.—*Sentinel*, June 7: During the present week the E. & P. railroad shipped 370 tons of ore to Salt Lake City. This amount is not up to the general average of shipments per week. The falling off is due to the Diamond Co. using the teams in hauling their new machinery and lumber, in place of hauling ore from the mine.

Hicks District.

AN EXAMINATION.—*Elko Free Press*, June 7: We understand that a mining expert of high scientific attainments, from the East, visited this (Hicks) district some 8 or 10 days ago with a view of examining the Woonooke mine and its extension, and reporting thereon to a party of prominent St. Louis capitalists. After examining the mines and their surroundings he was much pleased with the size and character of the ore bodies exposed to view, as well as the richness of the same, and when informed of the number of mining districts that lie in this mineral zone unexplored he was perfectly amazed at the vast metallic wealth that seemed to be in this remarkable region. The price fixed for the property examined is only \$100,000, and there is no doubt but what the sale will be consummated. The Hicks mining district is situated northeast from Mountain City some 13 miles, and from Elko about 75 miles due north. The mineral surface indications are very conspicuous and naturally attract the attention of geologists and mining experts. This mineral field is about 8 miles long and 5 wide. The formation is slate limestone with dykes of granite here and there. The ores are smelting, galena and carbonate in character with considerable desulphurized iron. The principal mines are situated on one of the main spurs of Hicks Mountain, known as Capital Hill. The principal ledges are the McDonald and Woonooke, owned by McDonald, and the First North Extension, which is owned by Messrs. Sproule & Mayhugh. To the south, on the same vein, is located the Constitution and the First South Extension; also the Globe, with several other locations of importance. The McDonald mine has been thoroughly explored and developed, and exposes to view several thousand tons of ore that will average from \$65 to \$70 per ton. The Woonooke is also well developed by a number of shafts and stopes which show a ledge 25 feet wide, giving an average assay of \$75 to \$80 per ton. The First North Extension has not been opened out yet to any extent, but all indications give promise of great value. Hicks Mountain is covered with an immense growth of large timber, suitable for mining, milling and domestic purposes. Just below the mine, in the canyon (which has an easy descent) some 800 or 900 feet, flows one of Nevada's most beautiful streams of pure water, gurgling the entire year from the base of this great mountain, whose altitude is not less than 12,000 feet above the level of the sea.

Jackrabbit District.

PROMISING OUTLOOK.—*Pioche Record*, June 2: Tuesday we paid a visit to Jackrabbit, and while there examined the Day mine and Onondaga, both the property of the Pioche Consolidated and Yuba Mining Co.'s.

THE DAY MINE was purchased by the present owners some three months ago, and is, under the ownership of Mr. T. C. Williams, proving a valuable piece of property. They are at present working a force of about 35 men and expect soon to increase. The mine is 900 feet deep, but work at present extends to 400 feet only. A drift of 800 feet leads one to where the engine is; a drop of 400 feet and you are on the 4th station where there is a body of ore in sight that is 100 feet wide and 7 feet thick and opened for about 200 feet. The amount of ore on this level is hard to compute, but it is safe to say that 100 tons a day can be shipped for two years at least. The advent of the railroad next fall will see trains loaded with Day ore leaving the depot regularly. The average of this ore is about 40 oz. silver and 20 per cent lead. On the engine level and where the strike was made which partly induced the purchase of the mine, a stope has been run for a distance of 200 feet, the ore averaging for the whole distance three feet in width, and will assay 50 to 80 oz. and 25 per cent lead. On the top workings of the mine there is a fine body of two feet of ore exposed that goes 200 oz. silver and with a little assorting will go 40 oz. per ton. The mine as it now stands with work only being done on the above-mentioned places shows more ore in sight and of a larger body than any mine on the coast, possibly outside of the Comstock. The same body of ore shows itself on the 6th level, but has not been opened up yet.

THE ONONDAGA MINE, which has recently been purchased from Messrs. Turner, Welland and Williams for the sum of \$36,000, is another fine piece of property. The ore of this mine is easily worked and of a more than average grade. There are at present five men taking out ore, and it is understood that it will not be long before more men will be put on.

Jersey District.

SHIPMENT OF LEAD ORE.—*Reese River Reveille*, June 4: John Able hauled to the N. C. track, this side of Bridges' station, yesterday, 40 sacks of lead ore, taken from Blossom's mine in the Jersey district. He, S. W. Sturgeon and George Able have leased it, and propose taking out a carload and having it sampled at Ledlie. We learn that it carries a large per cent of lead, and that the Ledlie sampling works will take every ton of it, as it is very valuable to mix with smelting ores. The boys speak very favorably of their prospect and propose to get out everything that there is in it.

Jungo District.

PROSPECTING.—*Silver State*, June 5: C. S. Wright and Charley Harvey are prospecting a mine which they own in Jungo district, 40 miles west of

Winnemucca. They have sunk a shaft twelve feet deep and have a lead about ten feet wide. The ore carries considerable galena and carbonate of lead combined with silver and gold. They have brought in 16 sacks of ore which they will ship to the Selby smelting works to be reduced.

Montezuma District.

TO RESUME WORK.—Walker *Lead Bulletin*, June 4: On Friday last two Eastern mining men, Messrs. Vorhees and Baxter, passed through Hawthorne en route to Montezuma, an old mining camp in the southern portion of this county. In the early days the mines of Montezuma district yielded rich though rebellious ore, but owing to the great cost of transportation and the primitive manner of mining and milling then in vogue, work was discontinued. The property has now fallen into the hands of energetic Eastern men, and if Messrs. Baxter and Vorhees report favorably, work will be resumed at once. These gentlemen were favorably impressed with Hawthorne as the site for smelting furnaces, and promise on their return to devote several days to an examination of our mines.

Oceola District.

GOLD PLACERS.—Nevada *Transcript*, June 7: The big ditch at the Oceola placers, at the base of Jeff Davis peak, Eastern Nevada, the construction of which James Marriott, formerly of North Bloomfield, has been superintending, is completed. It brings an immense supply of water for hydraulic mining. There is a great field that will not be washed out in 20 years. It is not only rich in fine gold, but also in huge nuggets. A mass of gold worth several thousand dollars was taken out of the placers years ago, when some work was done on a small scale. The parties who now have the mine are going to work with the best of apparatus, and will use electric lights in order to run day and night.

ARIZONA.

MILL RUNNING.—Tombstone *Prospector*, June 6: The Sterling silver mill is running a hundred tons of ore from the Bunker Hill mine. This company is purchasing some ore also on the outside and paying cash for it.

TOMBSTONE.—*Prospector*, June 7: The State of Maine is shipping at regular intervals and keeps the same force of men at work. At the Uncle Sam the north extension of the State of Maine ledge is being opened up in good shape. The Randolph shipped a carload of ore last week and is still taking out ore from the same streak. The Diamond litch is being worked by two parties of chloriders who must be doing well as they bought a new whim and put it in place last week. The Sterling Silver Mill is running steady on ore from the Turquois and Bunker Hill mines. The T. M. & M. Co. are steadily working on four of their properties and making regular shipments of about 300 tons per month. They have any amount of mining ground that has never been explored yet, but the company is prospecting it as fast as the output of the mines will pay for doing it. In the Lucky Cuss they reached water level in a winze from the 5th level where they found that they can sink their main shaft 85 feet further before reaching water, and which they intend to do soon. At the Northwest small feeders of ore are followed with the expectation of finding the continuation of the rich old ore chimneys.

QUICKSILVER.—*Journal-Miner*, June 3: The editor of the *Journal-Miner* recently paid a visit to Copper Basin, in company with H. A. Owens, a miner of many years experience, to look at the cinabar claims of Mr. McNary and son. They have, in all, 13 claims located, and have done a little prospecting on the surface of several of them. One shaft is down to a depth of 30 feet, and shows ore all this distance, while croppings can be seen covering the hills for a mile or so in extent. The locators of these claims are poor and are in no condition financially to prospect the property, but the showing made by the work they have already done is certainly of an encouraging nature and would justify a mining company to expend a considerable amount of money in developing the property. Both of the visitors mentioned above were surprised at the apparent richness of the prospects. The ore taken just as it comes from the mine gives a percentage far above that required to pay expenses. Mr. McNary and his son have a bottle of pretty nearly pure quicksilver, which they obtained from the rock in the most primitive method by means of heating in an ordinary metal quicksilver flask, with a pipe screwed into the top of it, the pipe leading into a vessel containing water, where the quicksilver fumes were condensed and caught. The opening up of this property, should it hold out on development as well as indicated by surface croppings, would certainly be the means of making one of the largest mining camps in Arizona. The claims are located within 12 or 13 miles of Prescott. Water is in abundance within a mile of the claims, while plenty of wood is also convenient, making the working of the property a practical proposition.

COLORADO.

STRIKE IN QUEEN'S GULCH.—*Aspen Times*, June 6: A strike has been made in the Dubuque tunnel in Queen's gulch that gives promise of being one of the most important that has been recorded in this district for a long time. It has been definitely ascertained that in drifting south from the tunnel a streak of ore has been opened up that is somewhere from five to eight feet thick and that runs very high. The Dubuque tunnel is on a group of claims owned by the Castle Rock Mining Co., which claims are under lease and bond to a party of gentlemen headed by ex-President John Scott of the Midland railroad. S. M. Boyer is manager for the lessees, and other Aspen gentlemen are interested in the enterprise. Several months ago the tunnel struck the contact after having been driven about 675 feet. The contact looked well, and it was determined to drive another tunnel at a point lower down in order to cut the lode some 400 feet deeper. This second tunnel has been driven 100 feet, and it is expected that it will reach the contact in about 30 days. In the meantime some drifting has been done from the Dubuque tunnel, and it is in the south drift that the present strike has been made. The contact in which the ore has been found is somewhere from 20 to 30 feet thick. The ore was first met with about two weeks ago and has been continually improving from that time

to this. Parties who have recently visited the property state that it is the best outlook for a big mine that they have ever seen. Assays from the ore body run all the way from 1000 to 5000 ounces, and the entire pay streak is said to be very high grade.

DAKOTA.

AT THE CALEDONIA.—*Deadwood Pioneer*, June 6: It was reported late yesterday afternoon that the Caledonia mine was flooded with water, and that all the men were compelled to quit work. The report that the mine was flooded could not be verified, but it was positively stated that the men had quit work on account of some unexpected occurrence at this mine.

FLOAT.—There is no boom or great excitement prevailing in oil, but slowly and very surely the big drill of Kilpatrick Bros. & Collins, of Newcastle, is going down after a flow of oil, and then you who have kerosene, look out. A miner in from Hill City last evening reports the greatest activity in that camp. James Wilson is bonding mines every day and is paying up on those previously bonded. A stream of money is going out to mine and claim owners every day. He, our informant, made a sale to Mr. Wilson of a good mine, for which he received, spot cash, \$13,000. He was informed that Mr. Wilson would disburse a half million dollars before he returned to New York.

IDAH0.

ANOTHER STRIKE IN THE RED ELEPHANT.—*Wood River Times*, June 4: Another ore body has just been uncovered in the Red Elephant, at the extreme northwestern part of the present workings, in a crosscut run in a westerly direction for the purpose of determining the location of an ore chute cut by a raise some time ago. The new find is now fully three feet in width, of first-class ore carrying a large amount of gray copper, and promises to be extensive, as it has already been followed three or four days and has improved right along. The Red Elephant is opening up splendidly, and will evidently give employment to a large number of men and prove very profitable to its owners.

THE CAMAS NO. 2.—The \$2800 gold brick brought to town yesterday, and which is the result of the cleanups of the last ten days' run of the Camas No. 2 mill, was sent to the United States Assay Office at Boise to-day. It weighs about 14 pounds and is worth about \$15 an ounce. This gold was caught on the plates, but it does not constitute the whole yield of the property during the time stated, as between three and four tons of concentrates worth about \$50 per ton were also extracted from the ore put through the mill during the same time. Reckoning the free gold and the concentrates together, the yield of the No. 2 during the past ten days therefore averaged over \$400 per day, or at the rate of about \$150,000 per annum. The actual cost of operating the property does not exceed \$200 per day. This, while not a very astonishing yield for a mine property, is nevertheless very gratifying. It is especially so to those old-time friends of the gold belt who have heard so many so-called experts gravely express the opinion that there was not a claim upon it that could ever be made to pay.

NEW DISTRICT.—*Idaho Avalanche*, June 7: Mr. B. H. Hyde of Oreana paid our town a visit on Wednesday. He informed us that a new mining district had been discovered on Poison creek, but just where he did not know. The lode found is about 40 feet wide, carrying some very rich silver ore. The lode was discovered by a sheep-herder, who informed Mr. H. W. Brown of Oreana, when the latter at once went to the lode and had some work performed. Mr. Hyde showed us a piece of the ore which carried a good deal of metallic silver. The lode lies between granite and slate. There is great excitement in the valley over the discovery, and as a result the country in that vicinity will be thoroughly prospected.

HARRISON.—*Ketchum Keystone*, June 7: Thomas Popham of the Harrison mine, at Boyle mountain, was in town this week having some assays made of samples of ore from his mine, with the following very flattering results: No. 1 gave 450 ounces silver and 72.60 per cent lead, and No. 2, 135 ounces silver and 59.50 per cent lead. These samples were from ore taken 62 feet from the surface. Mr. Popham says the vein averages about 2½ feet wide, four inches of which is high-grade ore. A tunnel has been run in on the ledge a distance of 181 feet, which will give about 84 feet of stopping ground from the end of the tunnel. T. B. Keller returned from a trip to the Buckskin mine last Tuesday and reports the mine looking well. He says that they have from four to seven feet of high-grade ore, and that in the last nine days four men have taken out about 40 tons of ore.

EAST FORK.—Our informant says that the mines and mining matters in general throughout the district are in a prosperous condition. It is expected that the North Star concentrator will start up in a few days. Mr. Thos. Rowe is foreman.

MONTANA.

ANACONDA AND ST. LAWRENCE.—*Butte Inter-Mountain*, June 7: At the Anaconda and St. Lawrence progress on the hoisting of the water from the Mammoth mines is progressing as favorably as the condition of affairs at present existing will permit. As fast as the water recedes the shaft is placed in serviceable condition by a force of men especially detailed for doing that particular work. The upper drifts are now free from water and is also receiving attention and is being put in a condition that will allow of the taking out of ore at the company's earliest convenience. Ore from those levels can be taken out while progress is being made in getting the water out from below that point. The steel tanks continue to accumulate copper as they are used and when sufficiently long in use to become dangerous they are replaced by others that are always ready at hand and no delay made in the hoisting.

NEW DISTRICT.—*Butte Inter-Mountain*, June 6: From Mr. A. H. Hedley, who is just in from near Jefferson Island on the line of the Butte & Gallatin road, it is learned that some rather important quartz discoveries have lately been brought to notice in that section. The district is named Cardwell, and is situated in the foothills and mountains three miles north of Jefferson Island. Up to this

time some 30 or 40 claims have been located, and although the development done is not very extensive as yet, the showing made is unusually good. The course of the veins is northwest and southeast and they are generally strong. One which he is at present developing has a width of between 25 and 30 feet. The locations thus far made cover the belt of mineral ground for a distance of two or three miles. The formation is porphyry. The ore bodies thus far shown up do not exceed five or six feet in width, but the great masses of paying float rock, which are lying around in great quantities, indicate big ore bodies. The ore is generally pretty high in grade, running from \$40 to \$200 in gold and silver, and carrying more or less copper and lead. Mr. Hedley has recently bonded to the Meader syndicate one group of his claims for \$20,000, and from the showing made there is no doubt of the bond being taken up. The outlook is very promising for a prosperous district.

THE DRUM LUMMON.—*Mining Journal*, June 6: The report has gained currency the past week, though from what source is not known, that the Drum Lummon has of late materially reduced its force at the mine. A careful inquiry refutes the rumor. Instead of curtailing its operations the Montana Co. is making preparations to extend them. A mammoth pump has been ordered from England and work will begin directly on a shaft which will be sunk to a much greater depth than the present workings. The company's last semi-annual report predicted a season of great prosperity for the mine—a prediction well founded, if one may judge from the confidence now expressed by those most competent to judge.

THE LION.—*New Northwest*, June 6: The company put in its new pump and got it to work on the 28th of last month, and it works like a charm. On the morning of the 29th the company commenced sinking, and have been going downward as fast as three shifts constantly at work could go through the ground.

THE McDERMOTT.—The McDermott Co. has had two assays made from 600 sacks of ore now ready for shipment. Assay No. 1 went \$23.56 copper, \$31 gold and \$7 silver; total, \$61.56. Assay No. 2 went \$7.59 copper, \$18.60 gold and \$5 silver; total, \$31.19. Two hundred additional sacks will at once be filled, and next week a shipment of 800 sacks will be made.

THE DUNKELBERG DISTRICT.—Both the Forest Rose and Hattie are looking well. Seven carloads of ore were shipped last week from the Forest Rose, the result of the work for May. The Hattie has several hundred sacks of ore and is now hauling to the Mitchell & Mussigbrod spur at the railroad, preparatory to shipment.

MINING NOTES.—Following were the shipments of bullion from the Butte mines for the week ending May 31: Butte & Boston, 16 bars, estimated value, \$25,840; Lexington, 16 bars, \$31,792; Moulton, 6 bars, \$9456; Clark Brothers, 3 bars, \$2320; total, 41 bars, \$99,408. Last week's shipment from the Bi-Metallic, 26,544 ounces, was the largest ever made from that mine. The output of the Bi-Metallic has been increasing for several weeks, and the appearance of the property is said to be improving at every point. The output of the Granite Mountain for the week ending May 29 was 49 bars of bullion, containing 72,435 ounces fine silver and 149 ounces fine gold.

NEW MEXICO.

DEVELOPMENTS.—*Silver City Enterprise*, June 6: A shipment of \$500 in bullion was made from the Atlantic last week. New triple-plated electroplates have been ordered for the Pacific mill. M. C. Jay of Georgetown returned Tuesday from Socorro. The car of ore which he took to Socorro returned \$3683. Two and a half tons of gold ore from the St. Helena of Central yielded \$138 through the arastra treatment. Considerable fine gold was carried in the tails. The output of the Graphic mine in Cook's Peak district, during the month of April, is reported to have netted \$12,000 above transportation and reduction. The *Enterprise* is reliably informed that Geo. W. Eustice did not ship any of the machinery from the Carlisle Co.'s property except the plates, which were sold in San Francisco. W. H. Loomis of Lone Mountain made a rich strike on the west slope of Lone Mountain. The claim is called the Good Luck. The vein is seven to eight feet in width, the whole of which assays from 10 to 15 ounces in silver, while a rich streak of from three to four inches runs 2178 ounces. Wm. Beall has purchased an interest in the property from Mr. Loomis, and has leased and bonded the remaining interest. He is now working the property and taking out good ore.

WASHINGTON.

LEDGE MATTER.—*Okanogan Outlook*, June 3: A powerful steam hoist has been purchased by the Arlington Co. to be used in working their mine. The hoisting machinery and a large quantity of supplies arrived this week for the Fourth of July mine. August Leiber and Andy O'Mally are taking some fine-looking rock out of the Eureka mine in the Lime Belt. The Lady of the Lake is looming up in great shape. Out of an 18-foot bole they have taken about 20 tons of high-grade ore. The Lone Star Co. will ship 50 tons of ore to the Tacoma smelter for treatment as soon as it starts up, which will be in about a month. It is reported by good responsible parties that T. L. Nixon of Tacoma has bonded the La Euna mine to Eastern parties for \$75,000. The Arlington Co. have started to sink 300 feet deeper on the ledge, which will give them a depth of 500 feet. They will also drift from the different levels as they go down. This work will take about a year, but by the time the mill is completed the mine will be in shape to put out ore at the rate of 75 or 100 tons per day. Allen C. Mason of the Lone Star returned to Tacoma the first of the week. During his stay in camp Mr. Mason visited all the principal mines in the Conconully and Ruby districts, including the Arlington, Fourth of July and First Thought on Ruby Hill, and declares that the Lone Star will not take second place with any of them. This visit has only strengthened his conviction that the Lone Star is a bonanza, and no expense will be spared in the opening up of the mine, which will be developed to the fullest extent. The main shaft will be sunk 100 feet deeper, and drifting from the different levels will be continued during the summer.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 3, 1890.

- 429,410.—CARPET-FASTENER—P. Beamish, S. F.
429,207.—TOURISTS' HEAD-REST—H. A. Bond, Los Angeles, Cal.
429,374.—SYRINGE—A. E. Charlesworth, Seattle, Wash.
429,510.—BOX-FASTENER—Davy & Dufau, S. F.
429,231.—WAVE FORCE-PUMP—Day & Cole, S. F.
429,191.—SAND-BOX FOR WATER CONDUITS—C. N. Earl, Los Angeles, Cal.
429,209.—FRUIT-PITTER—Elkins & Foreman, Bidwell's Bar, Cal.
429,378.—CLOTHES-DRIER—B. F. Fuller, McMinville, Ore.
429,242.—PORTABLE WINDLASS—J. I. Kinkead, S. F.
429,216.—RAILWAY CAR—Joel B. Low, S. F.
429,362.—SNAP HOOK—Nels Nelson, Aberdeen, Wash.
429,245.—AXLE-SET—W. F. Nightingale, Latrobe, Cal.
429,220.—DRAFT AND LAND-GAGE FOR PLOWS—O. T. Owens, S. F.
429,152.—DIPHTHERIA REMEDY—Lucinda M. Pierson, Goleta, Cal.
429,550.—CLOTHES-PIN—Mary E. Thrall, Riverside, Cal.
429,489.—CAN-HEAD CUTTER—A. S. Wadleigh, S. F.
19,874.—DESIGN—H. J. Crocker, S. F.

The following brief list by telegraph, for June 10, will appear more complete on receipt of mail advices:

California—Anders G. Anderson, West Oakland, tension device for belts; Charles Clements Kropp, S. F., musical notation; John P. Cutler, Los Angeles, pipe-ladder; E. Fish, Los Angeles, steam and gas generator; Melville D. Hemenway, S. F., shattering hanger; Edward C. Lottus and E. H. Booth, S. F., ore-feeder; R. N. Daleo, Palz, Alameda, calendar; Houghton Sawyer, S. F., apparatus for aging wines. Oregon—William L. Gilson, McMinville, grain-separator; Charles W. Treman, Portland, assignor to a prospective mining and machinery company of Oregon, amalgamator; Oles W. Weller, Baker City, ore crusher. Washington—Charles N. Henschel and H. E. Hall, Spangle, header-brake; Nathan A. Wheeler, Alpowa, wagon-brake.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DRAFT AND LAND GAGE FOR PLOWS.—Owen T. Owens, assignor to the Benicia Agricultural Works. No. 429,220. Dated June 3, 1890. This draft and land gage for plows consists of a draft bar having its rear end swiveled to a depending yoke beneath the beams to which the plows are attached, a guide through which the front end of the draft-bar passes and within which it is allowed a vertical movement, horizontal transverse guide-bars upon which this guiding yoke travels from side to side, a lever by which it is adjusted, and a holding-rack and the means for altering the points of attachment of the rear end of the draft-bar. By means of these adjustments and the free vertical movement allowed to the draft-bar within the yoke, the work is very much improved and the draft upon the horses is made very much lighter.

RAILWAY CAR.—Joel B. Low, S. F. No. 429,216. Dated June 3, 1890. This is a car for steam and street railways, though especially for the ordinary railways of cities and towns. The invention consists in the novel construction and arrangement of the seats, sashes and sides of the car, the object of which is to enable and facilitate the ready and easy conversion of the car from a closed to an open car, and vice versa, thereby adapting the same car for use in all kinds of weather. Cars of this style have been put in use on the Post-street line of cable railway in this city and found to be very successful, answering the purpose in every particular. The change from open to closed or closed to open can be made very quickly and while the car is in motion.

PORTABLE WINDLASS.—James I. Kinkead, S. F. No. 429,242. Dated June 3, 1890. This is a device which the inventor calls a portable windlass, which is designed to take the place of blocks and tackle and which may be used for the application of power to move loads. It consists of a light frame of iron, steel or other metal having the windlass shaft journaled across it near the center, with suitable crank attachments and guides formed integral with the frame, through which the rope passes, together with swivel attachments for anchoring ropes or chains, and certain details of construction. This windlass may be carried from place to place in the hand in the same manner as the block and tackle, the device being easily fixed and applied for the purpose of transmitting power.

AXLE-SET.—Willard F. Nightingale, Latrobe, El Dorado county. No. 429,245. Dated June 3, 1890. The object of this invention is to provide a simple and readily operated tool or implement of this class which will accurately determine the set and gather of the axle-splindle.

MECHANICAL PROGRESS.

A German Substitute for Scotch Pig.

Mr. Juenst has conducted a series of experiments in the Gleiwitz foundry in Upper Silesia, mainly with a view to produce a cheap material and thus emancipate the continental foundries from their present dependence on English and Scotch iron. The Scotch pig-iron, according to Gautier, its prominent qualities exclusively to its richness in silicon. He further maintains that the superfluous graphite in gray pig produced at a high temperature is eliminated by adding ferro-silicon to the latter, and that gray pig obtained by adding silicon to white pig becomes denser and more homogeneous than natural gray iron in consequence of the elimination of graphite. Silicon decarbonizes iron that contains manganese with greater difficulty than iron free from manganese; sulphur influences but little the formation of graphite, but opposes somewhat the decarburizing property of silicon.

Mr. Juenst found the statements of Turner, Lebedur, Wood and Gantier relating to the effect of silicon on cast iron to be generally correct. His experiments show that silicon adds to the density and strength of cast iron, and that ferro-silicon can be applied with advantage and without difficulty whenever the chemical composition of the material is approximately known. The suitable texture of the material can be obtained by remelting gray pig or by adding ferro-silicon. The German process of fusing together gray irons in order to produce castings of great strength is thus proved to be incorrect, although at the present high price of ferro-silicon it is still advantageous to employ gray pig iron for casting of only ordinary quality.

As to the most economical quantity of silicon in the ferro-manganese, 10.38 per cent proved to be the best; at 5.32 per cent the strength was great, but the product in other respects rather poor, probably because the necessary quantity of free silicon necessitated the presence of a great deal of manganese in the ferro-silicon.

Manganese and phosphorus up to one per cent, and sulphur up to 0.16 per cent, had no injurious effect.—*Berg & Huttenw. Ztg.*

THE HISTORY OF COMPOUND LOCOMOTIVES dates back to 1852, when two were built in England. The first American engine of this type was built by the Remingtons, at Ilion, N. Y., in 1870, for the Worcester & Shrewsbury Railroad Company. At the present time there are several hundred running in different parts of the world, mostly in Europe. The higher the pressure is raised, the more efficient steam will be, but 200 lbs. gauge pressure per square inch is about as far as is desirable to go, on account of the high temperature. Recent experiments with high-class modern locomotive boilers gave evaporative rates, from and at 212° Fah., of 5.68 lbs. with anthracite, and 7.2 with bituminous coal. Anthracite is far less efficient as a fuel than bituminous coal and should only be used for special reasons. Compound locomotive engines have shown good results in overcoming cylinder condensation—much better than either steam jacketing or super-heating. "Such result," said W. F. Dixon, when speaking of the efficiency of locomotives at the recent Cincinnati meeting of Mechanical Engineers, "is usually attributed to reducing the range of temperature per cylinder. Although this is probably true of slow-working engines, it is hard to see why it should be of fast-working, as indicator cards from ordinary single expansion express engines show very slight evidence of cylinder condensation. If the high pressures which have almost always gone with compounding cannot be held accountable for resulting economy, it is likely that the solution may be found in the fact that compounding makes high degrees of expansion imperative."

MAKING A STONE DRILL—A correspondent of the *Blacksmith and Wheelwright* gives the following suggestions, drawn from his experience, which should be followed in making, turning and sharpening a stone drill: First, in making a drill do not draw down the steel, but cut off each side and then upset back to widen the bit, making strong or light to suit the hardness or softness of the stone to be drilled. Next place the drill in the vise and trim off, then lay it down until cool, and then file and temper. Draw the temper twice to a deep blue and you will then have a tool that will drill without cornering a hole, and one that will also stand much better than an ordinary drill.

SOMETHING NEW IN REGARD TO STEAM.—Mr. F. G. Fowler of Bridgeport, Conn., recently addressed a society of engineers in that place respecting an alleged discovery in regard to steam, which he thinks may prove of vast importance. He showed how under certain conditions and circumstances the pressure of steam in a boiler can be doubled instantly, without additional heat; a fact which may possibly account for the many mysterious boiler explosions that are of so frequent occurrence. The combinations used in the experiments were produced by Mr. Fowler, but the same conditions are liable to occur without human assistance, and in such a case an explosion is almost certain, as the experiments proved. The conditions, it is stated, were the result of combin-

ing gases with the water in the boiler. These gases are of no benefit, but rather a detriment, but still they exist and occasionally make their presence known in a disastrous explosion. The removal of these gases, it was shown, would remove the cause of explosions. There appeared to be good evidence shown that a great discovery has been made, which if successfully developed will prove of immense value in steam engineering. His claims were demonstrated by a small boiler in which the pressure was raised to 40 pounds, and after being removed from the fire suddenly thrown to 80 pounds.

INCREASING THE SPEED OF LOCOMOTIVES—An interesting lecture was recently delivered by an engineer, Mr. Geitel, before the Berlin Polytechnic Society upon the demands made in our time upon locomotive builders. Locomotives are required which will cover 90 kilometers in an hour. This speed could be obtained by increasing the sizes of the cylinders, boiler and axles. But the engineer is forced to keep the locomotive within certain prescribed limits; the normal height is 4.8 meters. A further restriction is formed by the maximum weight fixed by the police. Another difficulty consists in the task of bringing the size of the boiler and cylinder into accord. The new means of increasing the working capacity of the locomotive consists in the steam which drives the locomotive being utilized to the utmost possible extent by allowing it to again perform its work in a high-pressure cylinder. High and low pressure cylinders have for some time been employed in marine engines, and they are also coming more and more into use for locomotives. Forty-nine were so fitted last year, and this year the number has already reached 87. Although the cost of locomotives with the two sorts of cylinders is greater, a compensation is found in the more economical consumption of steam, the saving in coal being equal to about 20 per cent. A further advantage is afforded by their increased working capacity.—*Kuhlow's.*

THE NEW METHOD of manufacturing articles from copper by electrical deposition seems to be attracting much attention, especially in England, where the idea originated. The process is considered by some as second only to the Bessemer process. There seems to be practically no limit to its application. Large tubes, vats, cylinders, and the like can be made direct from rough copper far cheaper than by any other process. The electrical conductivity of the annealed copper is greater by $\frac{1}{4}$ per cent than that of the best commercial copper; and the copper can be varied in tensile strength and ductility according to the requirements. The process is not confined to copper. It is equally applicable to nickel, silver or gold. A silver-plater in St. Louis recently placed a fresh egg in his silver bath. The result was a delicate work of art—a silver egg. After having the egg in his possession over a year, he broke it and was much surprised to find it as fresh as when first laid. Here was a new discovery, and subsequent discoveries led to the fact that many perishable substances, such as fresh and cooked meats, from which the blood had been expelled, cheese, the most perishable fruits, such as bananas, peaches, grapes, etc., could be preserved indefinitely by this mechanical process. He asserts that the process may even be successfully applied to embalming.

CAN IRON BE TEMPERED?—It has been the general opinion always, we believe, among blacksmiths that iron could not be tempered. Mr. E. K. Wehry of Lost Nation, Iowa, claims that it can be tempered, and he has sent us a piece of a horseshoe which goes to prove the truth of his assertion. He says in a letter to us on the subject: "You will see that I claim iron can be tempered or hardened so that a new file cannot touch it. To prove what I claim, I send you by to-day's mail a sample of a heel of an old horseshoe tempered in the same manner that I temper all the new shoes that I set. You will see that at last a way has been discovered to harden iron successfully. Although thousands of blacksmiths will tell you that it cannot be tempered or hardened, I am willing to put up \$50 that I can temper any kind of iron with fire and water alone, no drugs of any kind to be used." This opens up a very interesting question for the consideration of our readers, and we should like to have a general expression of opinion from them on the novel subject of tempering iron. We shall hope to print in our next issue the views of quite a number of our readers.—*E. & W.*

TEMPERING COPPER—AN INTERESTING FACT. C. S. Griffin writes as follows to the *Belfast Journal*: "I have recently learned a fact that may, if generally known, lead to the tempering of copper. A man at work on the telegraph wires here had hold of a copper wire with nippers on one line trying to make a short circuit, when the handle of his nippers touched the copper wire, and instantly a piece of his nipper was melted off and a piece of copper had formed on the point of the nippers, and on trying to file off this copper he found it was tempered to such a hardness that the file would not cut it. My brother, S. C. Griffin, tried to file it to make sure that it was really tempered. The ancients knew how to temper copper, but no modern genius has been able to temper it. As copper is a finer metal than iron, if it could only be tempered, it would make edge tools vastly superior to anything we now have, hence the importance of the discovery if once made practical."

SCIENTIFIC PROGRESS.

Prehistoric America.

Prof. F. W. Putnam recently read a paper before the Archaeological Association of the University of Pennsylvania. After congratulating the association upon having secured the services of such a competent archaeologist as Dr. Abbott, once his assistant at Cambridge, he said: "Surface-found collections are of interest, but they do not give the history of a people as does the excavation of a burial-place or a village site, and it is to be hoped that the new museum will devote itself to such explorations. Collections have already been made that show as much as can ever be hoped for from mere collecting. We should not only try to bring specimens together, but endeavor to find out who the people were, the direction of their migrations, and whether those of the North and the South were the same."

Prof. Putnam then declared his belief that the American Indian was the resultant of a mixture of races. "Two well-defined groups of races are found in America. They have entirely different shaped skulls. One group starts in Mexico and extends to Peru. They are a short-headed people. They extended across from Mexico along the Gulf coast, up the Mississippi valley and along the southern portion of the Atlantic Coast, not crossing the Alleghenies or found north of the Great Lakes. They were the people that built the mounds and founded the civilizations of Mexico and Peru."

"The objects exhibited from Wisconsin were made by another stock, a long-headed people who inhabited the northern part of the country. These two races have met and intermingled, and the result is the American Indian."

Prof. Putnam exhibited a series of photographs of copper ornaments found in a mound in Ohio. These objects, which number many thousands, had been thrown in a kind of fireplace about four feet square, where they were found. Notable among the ornaments were square plates of hammered copper, perforated with holes, and a large number of earrings, many of which were covered with thin sheets of silver and some with gold. A single ax was the only implement found. The existence of ornaments and the absence of implements is important in associating the old race of Ohio with the people of Mexico and Peru. Very few ornaments are discovered among the copper objects made by the northern stock. Not the slightest trace of smelting, however, is to be found, the metal objects found in the mounds, even galena, being cut in ornaments and not smelted.

Facts bearing upon the prehistoric condition of America are rapidly accumulating, some of which go to prove an antiquity of the human race on this continent equal to, if not exceeding, that assigned to man in the Old World. Implements have been found in various parts of the United States the age of which is estimated by different authorities at from 7000 to 100,000 years.

A finely wrought miniature image was recently brought to light in boring for an artesian well at Nampa, Ada Co., Idaho. It was taken from the eleventh distinct geological stratum pierced by the boring close to the twelfth stratum, which is of sandstone. It is apparently modeled from stiff clay, and if baked at all in the fire had been subjected to only a low degree of heat. The bearing of this discovery is of great importance. If we are compelled to ascribe to the image such antiquity as its geological situation indicates, it will go far to relieve the Calaveras skull of the obloquy which has rested upon it on account of its advanced stage of development; for certainly the brain that could have modeled so perfect a form as this must have been far removed from that of the ape-like progenitor supposed by Darwin to be the common ancestor of us all.

The Color of Human Beings.

The Sanscrit word for caste is *varna*, "color." India was inhabited originally by non-Aryan dark tribes. When the fairer Aryan race forced its way into the land, they recognized at once this difference between themselves and the indigenous tribes, and upon this foundation they built up their system of caste, which is generally ascribed most by those who understand least of it. Now the white skin of the Anglo-Saxon and the Anglo-American is to him precisely as much of a caste-mark as it was to the priestly caste of the Aryans when they invaded India. Formerly the belief prevailed that the dark races owed their color to a special dark layer of skin tissue. Microscopic investigations have shown that this is not the case. The skin consists of two layers, the outer, called epidermis, and the inner skin proper (cutis). The outer skin again consists of two layers, a transparent skin and a mucous tissue, called the malpighian net (*rete malpighii*). In this tissue, which lies between the true skin and the outer layer of the epidermis, are contained cells full of finely granulated pigment, or coloring matter. The upper part of the epidermis of a negro is just the same as that of a white man. According as these pigment cells are more or less numerous, the complexion is more or less dark. In all human beings there are some parts colored precisely in the same way, the nipples, freckles, moles, etc.

On the color of the skin depends the odor of

the exhalation. Those of the negro are generally described as rancid, ammoniacal, goatlike; in times happily past, the smell was wafted by the breezes and gave notice of the arrival of a slave ship. The American races have their own peculiar smell. Especially strong and repulsive to the Spaniards is that of the Aranaonians, the aborigines of Chili. The creoles have a special name for it, *soreno*. Indians have been known to express aversion against the white man's smell. It is evident from what has been stated just now that dark color is not due from influence of light and heat, in the ordinary way of browning from the outside owing to exposure. The cause of race color is much more difficult to account for. This much is certain, that there is evident connection between latitude and color. Even the ancient geographers, e. g., Pliny, believed that dusky skin meant origin near the equator. Certainly the deepest shades of black are at home only near the equator, in Africa, in India and New Guinea.—*Baltimore Sun.*

THE ORIGIN OF MAN AND ANIMALS—"The arguments drawn from the experimental facts of variation and natural selection from the observed progression of animal forms in successive geological strata, and the like," says Mr. Wallace in the *Popular Science Monthly*, "seem to me quite inadequate to explain the development of insects, fishes, birds, mammals, from one stock. Consequently, to my own mind, it is a relief to be able to think of several, and if of several then possibly of any number of original germs. The hypothesis is not opposed to, but quite in accordance with, Mr. Darwin's own views; in fact, he was far too cautious a man to dogmatize concerning the unity of the origin of living forms, when all attempts at the examination of the question of origin would necessarily carry him far beyond the limits of possible experiment. Let us then adopt provisionally the hypothesis of a multiplicity of germs of life; and if we do this, there is nothing wild or strange in the supposition that the germ of man was different from other germs. It would be beyond all that scientific caution would justify to assume that, given a number of original germs of life, it is a matter of chance into what each will develop. It is contrary, I think, to the whole analogy of Nature to suppose that a living germ, which is to all intents and purposes an ovum or egg, may ultimately develop into an oak or a fish, or a man, according to its surroundings or according to mere chance. At all events, it is much more probable, much more according to analogy, that each germ should have its specific character, and that so man should have been man in intention and preparation from the very beginning of things."

TORNADOES—The increasing frequency and greater destructiveness of tornadoes is attracting an increased share of scientific research into their character and cause and the means of preventing their destructive effects. Lieut. Finlay of the United States army, in an article on tornadoes, argues that these storms will come while the earth has an atmosphere, but believes that when navigation of the air shall have been made practicable, important researches might be made into the conditions which give rise to the tornado. Science, however, has so far offered little hope of solving the problem of aerial navigation. The late Louisville cyclone was probably one of the most formidable visitations of the kind on record, and presented most striking evidence of the destructive power of Nature's forces and man's insignificance in their presence. An examination of the ruined district, however, has revealed the fact that several buildings directly in the track of the most violent points of the disturbance, withstood the shock without serious damage. It has also been noticed that those buildings are of the most solid and substantial structure. This fact is one of much importance to architects and builders, as showing that the science and art of architecture has reached such a degree of efficiency as to render it possible for man to protect himself against the most extraordinary atmospheric disturbances of which we have any knowledge, and fairly avert their death-dealing effects. Late experience has shown that the element of safety from atmospheric pressure should enter more fully than heretofore into all architectural designs. The public at large should be alive to this matter and see that buildings which shelter families are properly constructed for resisting these extraordinary contingencies.

THE HELIOGRAPH.—During a recent trial with a heliograph in Arizona, a single sun-flash was sent from Fort McDowell to Fort Grant, 125 miles distant, where it was properly received, and from whence it was continued to Fort Huachuca, 90 miles farther—making 215 miles distance with one intervening station.

A SUNFISH of the genus *Orthogoriscus* was recently captured in the deeps between Lynn, Wisbeck and Boston, England, the first seen in that vicinity in 70 years. It measured from fin to fin $7\frac{1}{2}$ feet, and was $5\frac{1}{2}$ feet in length, weighing 750 pounds. It has been preserved.

THE "ANGLER" says dohsons or helgramites, a popular bait, are found among the dead leaves which lie at the bottom of stony brooks. Lift out a peck of the leaves with a hoe, and open them out on the bank, when the dohsons will crawl out.

THE BUILDER.

A NOVEL DESIGN FOR THE WORLD'S FAIR BUILDINGS.—A most striking design for these buildings at Chicago has been prepared by an architect of that city. He proposes to build a huge tent of iron, steel and stone, with glass roof and a central steel tower, 86 feet in diameter and 1100 feet high. This will contain eight elevators. From its top, steel cables will be stretched to the circular side walls, which will be 1500 feet from the base of the tower. Upon these cables the glass roof will rest. This will give an enormous circular building, 3000 feet in diameter, which, with the ground floor and two circular galleries, 75 feet wide, running around the building, will provide 193,000 acres of available space. By the aid of electric lights this enormous space would present magnificent vistas. Mr. Jenison asserts the practicability of such a structure. A reference to the Brooklyn bridge gives a comparison. That has a span of 1560 feet, while the cables of this building will be 1500 feet long. The bridge will support a moving load of 100 pounds per square foot, while here there will be only 10 pounds plus the wind pressure. This latter point has been carefully considered. A round surface will offer less resistance than any other, and the wind pressure can be successfully sustained by carefully adjusted tension rods. A considerable revenue would be derived from the elevators. The cost is estimated at \$5,865,000, or \$36.204 per acre. The Paris Exposition machinery hall cost \$75,080 per acre; the main building at Philadelphia \$73,591 per acre, and the London Crystal Palace, \$42,500 per acre. Of this cost about \$1,000,000 could be realized from the use of the old material. The exhibits could be arranged in converging lines toward a grand amphitheater around the central pole. Mr. Jenison proposes also a large circular canal around the inside of the building for various purposes. This is certainly the most captivating of all the novel projects yet proposed in connection with the exposition.

CARPENTERS' HORSES.—A Chicago genius has something to say about the wooden horses used by carpenters: The life of a horse is short, averaging about one-half the ordinary building season. If the average contractor were asked as to the number of horses in use in Chicago at a given time, he would probably answer, "I don't know." Our genius interviewed a great number of contractors, bricklayers, plasterers, etc., with the following result: A horse will average about 30 feet of lumber, and there are about 50,000 horses in use in the city today; double this for the season, and we have a total of 3,000,000 feet of lumber every year put into these awkward but useful and indispensable adjuncts of the building trade. The cost of horses is all the way from 60 to 75 cents each. This would make the estimate of the number here given much too small but for the further fact that many of the lesser concerns, who work only on small dwellings, make their horses last longer than here stated. Carpenters make them by the piece for the masons and plasterers, and evidently make a good thing of it. Why no one has thought to start a shop with a little outfit of suitable machinery, is a wonder. A better and cheaper horse could be made, and there is a pretty good chance for a business that involves the use of from 2,500,000 to 3,000,000 feet of lumber annually, or a business of upward of \$50,000. Many of the contractors have expressed the wish that there was such a concern, where they could send any time and get just what they want, and at a reasonable price. Who will make the venture?

ELECTRICITY IN PHOTOGRAPHY.—An English photographer claims to have obtained a photograph in which the natural colors were reproduced when the exposure was made, by accident, just at the moment when there came a blinding flash of lightning. He says that a friend of his once got a colored plate under similar circumstances, and believes that electricity has to do with photographing colors.

A STEM-WINDING SCREW-DRIVER has been made in Philadelphia, with the handle in two parts, these parts being capable of rotating one upon the other. A stop-pin and pawl limit the movement of the shank in one direction, while the top of the handle will move backward without turning the shank. The mechanism appears to be very similar to the principle of a stem-winding watch.

BUILDING WITH BRICK.—It is remarked that the central portion of a brick for building purposes is of little value, and could be left hollow as well as not where the material is an item to look out for, provided it makes no more work for those in the brickyards. They are to be stood on end, of course, to keep rats and other vermin from making use of the cavities in the basement.

FIREPLACE CONSTRUCTION.—Nothing is more cheerful in cold weather than an open fireplace, says the *Building Trades Journal*, but it has always been considered the most wasteful of fuel. There are, however, certain rules in fireplace construction, that, if followed, will reduce the waste to a minimum. The back wall of the fireplace should not be less than twelve inches from the face of the chimney-breast for soft coal or wood, and eight inches for hard coal. This wall should be carried up perpendicular for about six courses of brick and then inclined

forward so as to contract the throat of the flue. The top of the projection thus formed should be perfectly level, and should be about six inches above the chimney bars. The sides and top plate of the fireplace should be at right angles to each other, and each should form an angle of 135 degrees with the back wall, whose width should be one-third that of the front. By this arrangement the greatest quantity of heat is reflected into the room.

USEFUL INFORMATION.

WHAT THE WORLD OWES TO WORKINGMEN.—Said Sir John Lubbock recently in a lecture to English workmen: "It is remarkable how many of the improvements to which we owe the marvelous development of our manufacturing industry have been due to workmen. Watt was a mechanical engineer; Henry Cort, whose improvements in manufactures were said to have added more to the wealth of England than the whole value of the national debt, was the son of a brickmaker; Huntsman, the inventor of cast steel, was a poor watchmaker; Crompton was a weaver; Wedgwood was a potter; Brindley, Telford, Maebat and Neilson were workmen; George Stephenson began life as a cowboy at twopence a day, and could not read till he was eighteen; Dalton was the son of a poor weaver; Faraday of a blacksmith; Newcomen of a blacksmith; Arkwright began life as a barber; Sir H. Davy was an apothecary's apprentice, and Boulton, the 'father of Birmingham,' was a button maker. To these men, and others like them, the world owes a deep debt of gratitude. We ought to be as proud of them as of any of our generals or statesmen."

LUSTROUS METALLIC GLASS SURFACES.—The following methods of preparation of lustrous metallic surfaces on glass and glazed ceramic is described in the *Journal of the Society of Chemical Industry*: An aqueous solution of silver nitrate is mixed with a paste which, when heated in a muffle at a low temperature, will not fuse to the glass or porcelain, but can be readily detached from it. Suitable paste may be made from chalk, earth, lampblack, sulphur, madder lake, manganese dioxide and oxide of iron. During the heating in the muffle the silver passes from the paste to the surface of the glass or porcelain. The paste is then carefully removed and the article heated gently for a few minutes in a reducing atmosphere, preferably in carbonic oxide. An adherent lustrous metallic coating is produced which in transmitted light appears light yellow to dark-green white, while the luster varies in appearance from that of silver to greenish gold. Three parts of paste are used for one part of silver nitrate. Chloride of sulphide of silver may also be used, the former imparting a greenish and the latter a yellow color.

ERASING INK LINES.—A correspondent of the *American Machinist* gives the following: It is sometimes necessary, unpleasant as it may be, to erase inked lines, especially on patent-office drawings. The erasing is well enough, but to draw lines over the erased spot, and to be as distinct as any of the other lines of the drawing, is accomplished by erasing the lines carefully without making ditches; then apply with a brush a thin solution of gum arabic with half that of alum; when wet the paper will swell. After perfectly dry, burnish down, and it will be as good as ever, and often better than the paper, for this varies in quality. If the drawing is to be very elaborate, and tinted, it is best to test the paper as to its quality before any inking is done, and apply with a sponge a very thin solution of the same liquid evenly, not let it run into the paper if pools are formed, but remove them—as everybody, I suppose, knows, the paper not being sized in this manner before the drawing is made, will shrink and change the scale—certainly poor paper wants a better treatment than good and homogeneous paper.

TEA CULTURE IN COLORADO.—According to the *Denver Grocer*, a great industry, that of tea culture, has practically sprung up within the State of Colorado. Not many miles from Denver a gentleman is said to have set himself in the most deliberate and determined manner to the solution of the tea problem, from the American standpoint. Careful and continued investigation by him is said to have resulted in the discovery that the conditions of soil and climate existing in several points of Colorado are substantially similar to those in existence in the northern tea districts of China. The progress of this new industry will be watched with much interest.

UNCERTAINTIES OF THE LAW.—Some one of a statistical turn of mind says he has ascertained that out of 14,779 murderers who took human life in the six years from 1884 to 1889, only 558 paid the penalty of their crimes by yielding their own lives to the law.

CHEAP PAINT.—A householder in Bangalore, India, is said to have for years used nothing but the dust off the roads, mixed with linseed oil, as a paint for woodwork exposed to the weather.

HAPPINESS is more in the expectation than in the realization. We chase happiness while unhappiness is continually dogging our footsteps.

GOOD HEALTH.

The Ear-Ring.

The habit of having the ears bored and wearing ear-rings seems to be gradually going out of fashion, and well it may. There is often danger, always more or less trouble, connected with the habit. A melancholy case has recently occurred in this vicinity, which is chronicled as follows:

Miss Cyrena Boyd of Winters, Yolo county, died in San Francisco April 30th, of blood poisoning. While in the city some time ago visiting friends she had her ears pierced. She returned home, but was shortly afterward caught in a severe rainstorm. She took cold, erysipelas set in and she came to this city for treatment. Instead of improving, however, she grew worse, and her ears and face became terribly swollen.

After suffering great agony, death came to the young lady's relief four days later. A telegram was sent to her parents at Winters in time for them to have arrived before their daughter passed away, but on account of some delay there they did not receive the message until too late. Deceased was an attractive young lady, 19 years of age, and a favorite in the neighborhood of her home.

In connection with the above, the following paragraph, which we find on our table, may possibly be read with interest:

There is a certain pleasure in watching the decline and fall of the ear-ring. If I had written "Looking Backward" I should have inserted somewhere a reminiscence of the last woman who bored holes in her flesh to permit the fastening of an ornament. The attempt to revive the Creole, or hanging ear-ring, has utterly failed. The faintest suggestion of weight attached to the ear now displeases most well-bred women. Occasionally you see a face of such a shape that hanging ear-rings are temptingly becoming. Nettie Hooper, the pretty daughter of Lucy Hooper, the Paris correspondent, wore large Creole ear-rings, set with small pearls, at a recent reception, and they accentuated her piquancy, but the hanging ear-ring, as a rule, is an abomination. Even the stud ear-ring is less worn. Fine jewels are less often set in ear-rings, and many which have thus been used are going back to the jewelers to be reset as pendants or in brooches. It is not a usual thing now to see a debutante whose ears have been pierced, and matrons often use various little artifices to conceal the traces of the needle.

INCREASE OF INSANITY.—Recent investigations conducted by M. Paul Garnier and embodied in a report to a convention of French doctors give startling facts as to the increase of insanity in France, and especially as to the increase of that form of insanity due to the excessive use of alcoholic drinks. From 1871 to 1888, insanity increased by 30 per cent. Fifty-six per cent of the insane are men and 44 per cent are women. The increase during the past 17 years has been almost entirely in the branches of alcoholic insanity and of general paralysis or paresis. There has been very little increase in mania, melancholia and chronic delirium. Alcohol and overwork are, therefore, held responsible for the greater part of the increase of insanity during recent years. The frequency of alcoholic insanity has doubled within the past 15 years, and the cases have increased 25 per cent in the last three years. Fifteen years ago the proportion of women among the cases of alcoholic insanity was one-sixth. Now it is one-fifth. A singular fact noted is that the number of new cases of insanity is greater in the spring, the month of May seeming to inaugurate annually an epidemic.

VACCINATION.—The right of the State to require the vaccination of children before admitting them to the public schools has been affirmed by the Supreme Court Commissioners. The efficacy of Jenner's method of preventing the spread of smallpox was recently strikingly exemplified by the experience of the members of Stanley's expedition, an epidemic playing sad havoc with a number of his followers who refused to submit to vaccination, while nearly all who did passed through the trying experience with little or no sickness.

PALPITATION OF THE HEART.—A French physician announces that distressing or excessive palpitation of the heart can always be arrested by bending double, the head down and the hands hanging, so as to produce a temporary congestion of the upper portion of the body. In nearly every instance of nervous palpitation the heart immediately resumes its natural function. If the movements of respiration are arrested during this action, the effect is still more rapid.

THE EYES.—When the average man or woman comes to be fitted with the first pair of glasses, some curious discoveries are made. Seven out of ten have stronger sight in one eye than the other. In two cases out of five, one eye is out of line. Nearly one-half the people are color-blind to some extent, and only one pair of eyes out of every fifteen are all right in all respects.

THE MARRIAGE STATE.—Prof. A. N. Klæver, a Norwegian statistician, has discovered and declared that the marriage state increases the death rate among women and decreases it among men.

ELECTRICITY.

INCREASING USES OF ELECTRICITY.—The increase in the use of electric lights and electric motors is shown by the *Electrical World* to be greater during the past few years than most people probably imagine. The number of electric lighting companies in the United States and Canada operating central stations at the beginning of 1886 was 450. This number had increased at the beginning of 1887 to 750, at the beginning of 1889 to nearly 1200, and at the beginning of 1890 to 1277, including 25 in Mexico and Central America. Meantime 266 gas companies had engaged in electric lighting, so that the total number of companies engaged in electric lighting at present is 1543. The number of isolated or private incandescent and arc light plants at the beginning of 1887 was about 1000 each. Now there are 3925 private plants in the United States, 175 in Canada, and 200 in Mexico and Central America, making 4300 in all. The number of arc lamps in use in 1882 was 6000. This number doubled each year for four years and has since grown rapidly until there are now 235,000. The number of incandescent lights has increased from 525,000 in 1886 to 3,000,000 at present. The number of electric motors now in operation in the country is estimated at 15,000. There are nearly 200 electric railways in over 125 towns and cities, and these have in operation or under contract 1834 cars on 1260 miles of track. Electricians, however, look for a great development of electric motors for railroads of all kinds during the next two years. Electric light and electric power for mining is a new development of considerable promise.

THE MOST PROMISING FIELD FOR THE INVENTOR, very correctly says a contemporary, is electricity. The best inventions in this field have mostly been made in the last 15 years—largely indeed inside of the past decade. Here the field is opening out and widening all the time, as new applications of the electric current or electric energy are being constantly discovered. Already the inventor in this field can be counted by the hundred, and there are, perhaps, more successful ones among them—that is, the ratio is greater than in any other field of invention. Just for a moment look at the prospect here presented. In the electric current we have an element of power that is more easily controlled and handled, more easily diffused over large areas, more adaptable to a greater variety of purposes, than any other of the forces of nature within our control. It will heat fourhouses, do our cooking, furnish us with light, and convey power anywhere that we may desire it to, and in any proportion we may call for. This covers a wide range of application, but it by no means exhausts the uses and purposes to which electricity can be applied, and this field, it will be seen, is therefore a most promising one to the young inventor.

CLEANING FILES BY ELECTRICITY.—An improved means for cleaning files, which is claimed to restore them to the condition of new files, is described as follows: After being cleaned and wetted, the files are dipped between two carbons into acidified water, and the circuit of an electric current is established between the carbons and the file by means of a piece of metal, serving as a support to the file, by which the latter is suspended. The water is then decomposed by the current, the oxygen acting upon the cuttings of the file, while the hydrogen bubbles settle in the teeth and protect them against the action of the acidified water. After immersion for a few minutes, the file is withdrawn and brushed in clear water to remove the oxide of iron, and then replaced in the bath. When the cuttings are entirely cleared, the file should be immersed in an alkaline bath to remove all traces of the acid, then dried and brushed.

A NEW IDEA FOR ELECTRIC WELDING.—It seems that the uses to which electric welding can be put are not yet exhausted. Lieut. W. M. Wood, U. S. N., has conceived the idea of applying the electric welding process to projectiles. He consulted the officials of the Thomson Electric Welding Co., and the experiments were made. So successful were they that letters patent are now being applied for. Heretofore the Government has had to bore into solid metal at a great cost. By the new process a steel tube of the proper length and thickness is welded to the head and then to the butt of the shell, accomplishing in a few minutes what formerly took hours of costly machine labor. The Government officials in the Ordnance department are very much interested in the result of these experiments.

TOADS AND ELECTRIC LIGHTS.—A lady tells how she was recently waiting in a carriage near an electric lamp in Montreal, which had just been lighted, while her friend went to a neighboring shop. In the dry road she saw presently a stir, and, looking over the wheel, saw, hopping in all directions, a multitude of toads moving toward the light. There was a ring of toads underneath, evidently waiting for the moths and other insects that nightly drop from the life-destroying flame. It was a curious sight to witness those curious creatures squatted in a circle, with upturned heads waiting for their snappers which they knew would soon drop into their mouths.

TABLE OF CONTENTS.

EDITORIALS.—Retorting and Melting, 393. Paesing Events; Milling Ores on the Comstock; More Cruisers to be Built Here, 400. In the High Sierras, 401. Exhibit of Minerals, 402.

ILLUSTRATIONS.—Section of Retort; Single Retort and Melting Furnace; Double Silver Retorts and Melting Furnace; Improved Bullion Melting Furnace, 393. Sketch Map Showing Points of Interest in Sierras; Lake Eleanor; On the Mount Lyell Glacier; View of the "Alpa" looking S. E. from Mt. Lyell, Mt. Ritter in Center, 401.

OBSCURE RESPONSE.—Mines of Calaveras County; The Mesquite Bean; Hidden Dangers in Dam Building; The Gold Belt of Northern California, 394.

MISCELLANEOUS.—Entrance on Arid Lands; Cerro Gordo District, Big Time for the World's Fair; Chinese Miners on Public Land, 395.

MECHANICAL PROGRESS.—A German Substitute for Scotch Pig; Making a Stone Drill; Something New in Regard to Steam; Increasing the Speed of Locomotives; Can Iron be Tempered; Tempering Copper; Miscellaneous, 393.

SCIENTIFIC PROGRESS.—Prehistoric America; The Color of Human Beings; The Origin of Man and Animals; Tomatoes; Miscellaneous, 393.

THE BUILDER.—A Novel Design for the World's Fair Building; Carpenter's Horses; Fireplace Construction; Miscellaneous, 399.

USEFUL INFORMATION.—What the World Owe to Workingmen; Lustrous Metallic Glass Surfaces; Era in Ink Lines; Tea Culture in Colorado; Miscellaneous, 399.

GOOD HEALTH.—The Ear-Ring; Increase of Inanity; Miscellaneous, 399.

ELECTRICITY.—Increasing Use of Electricity; Cleaning Files by Electricity; Miscellaneous, 399.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 396-397.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 404.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 404.

Business Announcements.

[NEW THIS ISSUE.]

Assessment Notice—Camelero Land and Coal Company.
Delinquent Sale Notice—Gray Eagle Mining Company.
Automatic Pop Safety Valves—H. P. Gregory & Co.
Meeting Notice—Camelero Land and Coal Company.

Passing Events.

It is apparent that copper is again on the advance, the stocks on hand being rapidly reduced. The French syndicate have disposed of two-thirds of what they had at the time of the collapse. The demand for the metal is largely on the increase.

As a result of the opening of the bids for armored vessels at Washington, it is apparent that the Union Iron Works of this city will have two more vessels to build, one of them a very large ship. It is gratifying to note that the shipbuilding industry on this coast is gradually enlarging.

It has been determined to add to the "California on Wheels" exhibit of the products of California now going about the United States, a lot of mineral specimens to illustrate our mining industry.

The foundry strike still continues with little change in the situation. All the foundries are at work with non-union men, but the members of the molders' union still "picket" the shops and profess to be confident of ultimately getting the best of the Foundrymen's Association. The latter seem indifferent, having men enough for the present.

The Comstock mining companies paid out in wages last month \$249,024. Of this, the Con. California and Virginia paid \$54,592.

Milling Ores on the Comstock.

The sworn quarterly reports of the bullion produced by the various ore-yielding mines on the Comstock lode which were published in April are full of interest to stockholders. An analysis of these reports develops a condition of affairs which is certainly not encouraging for those who hold stock in these corporations.

We find that the Overman mine took out during the quarter ending March 31, 1890, 1670 tons of ore yielding gross \$22,657.19, or \$13.57 per ton. The cost of handling this, including transportation, extraction and reduction, was \$17,914, showing a profit of \$4742.97.

The pulp assays from Overman for the four weeks ending March 29th show an average of \$17.39 per ton; they therefore saved .78 per cent of the pulp assay.

The Savage Mining Company, we find from their sworn bullion report, took out during the quarter mentioned:

4570 tons of ore yielding gross	\$14.40 per ton	\$65,795.76
Cost of extraction, etc.		\$9,718.63

Loss to the company	\$14,922.92
---------------------	-------------

The pulp assays given in the weekly reports of the Savage Company show an average of \$22.27 per ton, as by their bullion report they saved \$14.40 per ton, and saved .647-10 per cent of the pulp assay. The Hale and Norcross Mining Company, we find from their bullion report, took out:

5859 tons ore yielding gross	\$11.55 per ton	\$67,683.98
Cost of extraction, etc.		\$10,359.77

Loss to the company	\$36,890.70
---------------------	-------------

The pulp assays as given by them during the quarter show an average of \$17.57 per ton. According to their bullion report they saved out of this \$11.55 per ton, or 65 74-100 per cent of the pulp assays.

The Consolidated Virginia and California show an output of ore for the quarter of 25,680 tons. Average according to their bullion report \$18.10 per ton. The average of their pulp assays for the same period is \$25.81 per ton, they, therefore, saved .70 per cent of the pulp assay.

The Crown Point Mining Company yielded according to their bullion report 7059 tons of ore averaging \$11.50 per ton. Their pulp assays for the same time averaged \$16.96 per ton, they, therefore, saved 67 8-10 per cent of the pulp assay.

When it is understood that all these ores can be and should be worked up to 85 per cent of the pulp assay, the carelessness in their handling can be easily seen.

The losses to the companies here mentioned can be better understood when they are put into figures.

To the Overman Company the difference between 78 and 85 per cent is.....	\$2,323.30
Savage, difference between 64.7 per cent and 85 per cent.....	19,080.10
Hale and Norcross, difference between 65.74 per cent and 85 per cent.....	19,803.42
Con. Va and Cal., difference between 70 per cent and 85 per cent.....	99,381.80
Crown Point, difference between 67.8 per cent and 85 per cent.....	20,612.28

Waste in five mines which went to the gain of the mills.....	\$161,750.70
--	--------------

Taking the same ratio for the balance of the mines, the loss certainly runs over \$200,000 for the quarter. This all went to the gain of the millmen, in addition to \$7 per ton paid for milling, which on 44,838 tons from five mines mentioned above, amounts to \$313,866. As the assays of the rock delivered at the mills are not given by the companies, it is impossible to tell how close to the true assay value it is worked by the mills. A strong head of water and open screens can make the battery slimes very rich, and no one would be the wiser, as the assay value of the ore as delivered to the mill is not given.

If the losses mentioned herein were necessary and usual, no fault could be found, but they are not necessary, are inexcusable and the result of negligence bordering on something worse.

It is known that the California pan-mill will work ore up to 90 per cent of its pulp assays. Silver mines carrying free-milling ores going no higher than \$15 per ton are sought after as investments and pay good interest.

In the Calico mining district in California silver ores assaying from \$13 to 16 per ton with no gold in them are worked at a profit to their owners and are paying dividends.

Why then should higher grade free-milling ore on the Comstock lose money for the mines that produce them. The loss is plainly in the

mills. They are getting the whole benefit of the work of the mines. They are being paid for milling ores which they are not milling properly and which they are working at a loss to the companies; whereas, if they were worked as they would be in a private corporation where the company owned the mill, they would pay dividends when under the present system assessments are levied to take out the ore.

In other words, stockholders who own paying properties are paying assessments for the benefit of the mill ring. This would not occur if the directors of the several companies would do their duty. In former times when directors made contracts with the mills, there was incorporated in the contract a clause compelling the mill-owners to work the rock to a certain per cent of the car or mine assay value. We believe that 65 per cent was the amount usually given. This is not done now, and the stockholders of the companies are left unprotected and at the mercy of the millmen.

When J. P. Jones worked the Con. Virginia and California under contract, careful assays of the rock were kept by both parties, as is said, for their mutual protection; but the gentlemen who are acting as directors of the various mining companies apparently do not think that there is any necessity for the protection of stockholders, and leave them to be skinned by the millmen.

In view of the peculiar conditions existing on the Comstock Lode, it will not be amiss to consider the effects resulting therefrom. We find, upon investigation, that the Chollar mill is owned by Senator J. P. Jones, Alvinza Hayward and W. S. Hobart. The Union Mill Company is the property of Senator J. P. Jones, D. O. Mills, F. G. Newlands, the Sharon estate and R. F. Morrow. The Nevada mill is owned by John W. Mackay and James L. Flood.

Can it be considered a startling coincidence that among these gentlemen, owners of the mills, are found the millionaires of the Comstock? The paupers are found among the stockholders of the mining companies, who intrust their interests to those who, from personal interest or criminal neglect, sacrifice them and their poor earnings to the mill-owners.

There is nothing new in this story of misappropriation on the Comstock. It is bare-faced and without cover. There are few in the State of Nevada, he they deaf, dumb and blind, who know not of it. It has been said that with such general knowledge it is strange that such illegal acts can be perpetrated.

The Board of Directors who are managing these mines are continued in power by the proxies given them by the parties in whose names the stock stands. As the most of the stock is in the name of the brokers, it is evident that they are furnishing the power with which they are destroying their business. There can be no healthy condition of mining shares until the present wholesale looting of the mines is stopped.

Why should manipulators make a market to sell their goods when they can get all there is in the mines through their mill system and all the money the people have through their Boards of Directors and the assessment system. A crumb is occasionally thrown to the brokers just sufficient to keep them from absolutely starving and keep them from getting restless under the lash.

That the brokers connected with the stock exchanges here are so blind to their interests as to continue in power those who are constantly destroying and rendering valueless the very properties upon which they, the brokers, are dependent for their income, is beyond the understanding of any reasonable man.

Would the New York Board of Brokers, or any other board of brokers in the world, stand listless, and without remonstrance or resistance permit any board of directors of any organization listed and daily dealt in by them wreck and ruin the property intrusted to them and wreck and ruin the people who trusted them with its management? Would they aid such board or boards of directors by lending them their property, or that of their customers, with which to carry out their nefarious schemes? We think not, but it is done constantly here in San Francisco with the mining companies on the Comstock lode. There certainly never was anywhere in the world such a condition existing as exists in stock circles here to-day.

If a discovery is made on the Comstock with

money received as assessments on stockholders, the ore contained therein goes to the enrichment of the mill-owners, and in some instances further assessments are levied to take the ore out.

More Cruisers to be Built Here.

Bids for over \$5,000,000 were opened at Washington at the Navy Department, on Tuesday, for the construction of new war-ships. The Union Iron Works of San Francisco, bid \$3,100,000 for armored cruiser No. 2, according to the Government specifications, William Cramp & Son of Philadelphia, bid \$3,150,000 and the Risdon Iron Locomotive Works, San Francisco, \$3,450,000. For the construction of the vessel according to their own plans the Union Iron Works bid \$3,000,000 and the Cramps \$2,985,000.

The big armored cruiser No. 2 is an 8100 ton vessel. She belongs to the class of swift cruisers and is very close to a battle ship in that she is provided with a moderately heavy armor belt, besides a protective deck. Her armor will be about four inches thick and the curved protective deck will be six inches thick. She will be armed with six 8-inch and twelve 4 inch breech-loading rifles. Her engines will develop 16,000 indicated horse-power and a speed of twenty knots an hour. Her dimensions are: Length, 380 feet; extreme breadth, 64 feet 2 1/2 inches; depth in hold, 41 feet 3 inches.

The Secretary of the Navy has referred the plans to the Chief Naval Constructor and Chief Engineer, who will shortly report. It is generally believed that both the vessels will be built by the Union Iron Works in this city. This will be quite a triumph for the Pacific Coast and for the energetic managers of the Union Iron Works.

Retorting and Melting.

(Continued from page 393.)

at the bottom of the pan. As soon as a bar is poured, the discharge spout is stopped with a plug of bone-ash until sufficient bullion has accumulated for another bar. After the first bar has been melted, the succeeding ones can be melted and poured at intervals of about 15 minutes each, bullion and charcoal being piled on top as fast as necessary.

As an actual fact, one man can easily melt six bars, of about 4500 ounces troy each, and have his furnace empty in two hours from lighting the fire.

The advantages of this style of melting over crucibles are obvious, and it has also an advantage over the reverberatory furnace in that the melting is done by a reducing flame instead of an oxidizing one, thus avoiding the loss of silver by oxidation.

Two blast tuyeres pass through the water-hack and the blast is supplied by a Root blower. A blower of suitable capacity and an extra pan-bottom are supplied with each furnace. These furnaces, and also the retorts, are built by the Folton Iron Works of this city.

MILLING AT PACHUCA.—E. C. Van Blarcom has resigned his position as superintendent of the Hacienda de San Francisco (quartz-mill) at Pachuca, Mexico. In the future, Mr. Van Blarcom proposes to pay more attention to consulting engineering, making a specialty of milling. From Mr. Van Blarcom we learn that the Hacienda de San Francisco has been quite successful, silver ores carrying only ten ounces per ton being worked to a profit. At Pachuca, coal costs \$19.20 per ton, salt \$48 per ton, and sulphate of copper 10 cents per pound. The success of this mill speaks well for the process—"Boes Continuous"—and also for the ability of Mr. Van Blarcom as a manager and amalgamator. For the present, Mr. Van Blarcom will make his headquarters in Pachuca.

BULLION SHIPPED.—Atx. Wise last week shipped two bars of bullion from the Humboldt reduction works, Nev. This was the first shipment of bullion from the works since 1882, but it is expected that regular shipments will be made henceforth.

In the High Sierra.

During last summer a party of four young men from the University of California, visited the high Sierra on a vacation trip. They have told their experiences in the *Occident*, a college weekly conducted by the students, and from this narrative we make some extracts. They went by steamer to Stockton, and by rail to Milton, where they took stage to the old mining camp of Columbia, near Sonora. The rest of the trip was made on foot, camping out along the road. At the end of a week they reached Lake Eleanor, the first noteworthy place on the trip. There, also, they entered the region of country covered by their map, of which a slight sketch is here presented, to give a general idea of the location of the chief points of interest noticed. The dotted lines indicate the trails followed, and the round dots show some of the principal camps.

Eleanor is one of the larger of the numerous mountain lakes of that region, being some three or four miles long. Like most of the others, it is hemmed in by mountains, except at the lower end, where there is quite an extensive meadow, covered with rich grass and bright

THE "ALPS" LOOKING S. E. FROM MT. LYALL, MT. RITTER IN CENTER.

the two routes to Mt. Dana. Arriving there, the ascent of the mountain was made. This ascent is easy, as there is little danger from dislocated falling rocks, and there is very little real hand-and-foot climbing to be done. Leaving the peak, the party passed on through the

low us. At last we stood on the solid, icy snout of the glacier itself. The whole upper surface was covered with snow, but small rills had cut shallow channels which disclosed the solid ice beneath. It appeared treacherous to the footing, the glare from the surface was truly dazzling, and there was almost a mile of

was some danger of falling into the snow-covered crevices of the ice. But all was accomplished in safety.

Concerning the pinnacle, the Geological Survey report says: "The dominating point was ascended by Brewer and Hoffmann; but they were unable to reach the summit, which was found to be a sharp pinnacle of granite, rising up above the snow at a point estimated to be 150 feet from the top." We found it an extremely hazardous climb. The rock was broken into huge pieces, which did not seem to be very securely bound together. First, we passed up what in common parlance is called a "hog's back." A false rock, falling to the left, would have hurled us along with it to the bottom of the precipice, over a thousand feet below; falling to the right would have trundled us over its sharp fellows down to the Lyell glacier. At times one would cry to our bravest and most adventurous men: "Is that rock safe, D.?" More than once half of us resolved that it was foolhardy to make the attempt, but some new and safer way was always found. Now on the back, now on the stomach, under shelves and around narrow ledges, reaching ahead for a finger-tip hold, pulling the body cautiously up, was the only method of climbing. Sometimes a narrow gully offered the chance to wedge up by a successive expansion of elbows and knees. A slip and all would be over, but we were too careful.

At last we stood on the summit—the first party to make the complete ascent since 1885. The view from Dana is brilliant—that from Lyell is sublime. To the south—behold! 'tis the "Alps of California." Range after range, pinnacle after pinnacle, in absolute confusion. Hundreds of peaks rise into perpetual snow, terrific canyons intervening. Chill orags, serrated and serrate, point their weird fingers to the sky. Glistening glaciers project their dirt-handed snouts into lakes of greenish white. These abound everywhere. Conspicuously they rest upon the brink of granite benches, and seem as pure and divine, almost, as the beamless air about us. And over all dead silence reigns supreme. It was appalling, painful, inanimate—a great relief followed the first utterance of the human voice. Away to the westward Mt. Diablo just appeared through a curtain of smoke, a striking contrast to the heavenly purity of the atmosphere which bathed the peaks about us. The necessity of reaching camp before dark compelled our early departure, but not until we had followed the example of the seven who had already left their names on the summit, did we make the start.

It was 1 P. M. The sun was shining hotly on our heads, the melting snow was freezing our feet. As we hurried rashly along, D., who was in advance as usual, suddenly almost disappeared from sight. We guessed it all—he had fallen through a bridge of snow into a crevasse, the one object he feared in all glacier traveling. A camera was slung over his shoulder, and this probably saved his life. It caught upon one edge of the orag, his left arm rested on the other. He was hanging there as if ploated over the crevasse, which was two or three feet wide, and how deep? A stout etlok was immediately placed under his arms, and he was pulled out in less time than it takes to describe. It was a miraculous escape. We could gaze down between the heyl-like blue walls of ice,

SKETCH MAP SHOWING POINTS OF INTEREST IN SIERRAS.

flowers, and an occasional dense clump of willows. This meadow occupies the left of the view here shown, which is looking up the western shore of the lake from near the outlet.

After a pleasant day here, the young men went on to Hitch-Hitchy, a valley which is

Sierras to Mono Lake, and returned to Soda Springs for provisions, where two more young men joined them. They went on and camped near the foot of Mount Lyell, starting the next morning at 5 o'clock for the summit, anxious to see the "living glacier" they had heard so

much about. We were, however, prepared for every emergency; our shoes were well provided with nails, and a handkerchief tied around the head and hunched a little under the eyes protected them from the glaring light.

Small rills soon began to appear every-

LAKE ELEANOR.

not rich in natural wonders compared with the Yosemite, but still very interesting to visit. The Sugar-Loaf and the Hitch-Hitchy fall, with the attendant cliff, are the most notable features. From here they went to Yosemite valley, where they remained nine days, visiting all the points of interest.

From here they took the lesser frequented of

much about. After much exertion (they say in the narrative):

We found ourselves at the foot of the terminal moraine of the glacier, an elongated curved pile of rocks piled together in a confused heap, some 30 or 40 feet in height. We climbed it with the greatest of care, so as to prevent the insecurely poised rocks from rolling over and crushing those who might be he-

ON THE MOUNT LYALL GLACIER.

where, and level places were already becoming soggy.

We hastened to take advantage of what solidity there was yet remaining to the surface, but before the top was reached, we found the walking extremely laborious. At every step we would sink down from three or four inches to a foot, slide back a little, and then with greater effort, urge ourselves upward over the roughened, hilly surface. Then, too, there

but could see no bottom; probably it extended to the bottom of the glacier, here said to be a hundred feet in thickness. After that we tied ourselves together with a rope, as is seen in the photo-facsimile. Later on, as we were clambering down the moraine, a massive stone was displaced, which came thundering down upon those below, but happily, fate was again averted.

No other accidents occurred during our re-

turn, and excepting for the fact that two of the boys who, having neglected to take the proper precaution to protect their eyes, were partially snow-blinded, we had cause to be thankful to the spirit of the mountains which had guarded our fortunes throughout the day.

Exhibit of Minerals.

The State Board of Trade has decided to add a collection of minerals to the exhibit in "California on Wheels," and also in the rooms of the board. The following letter was this week forwarded to the various affiliated counties:

"We respectfully urge all counties, Chambers of Commerce and local Boards of Trade, having mineral resources in their respective localities, to make an exhibit at the rooms of this board and on 'California on Wheels.'"

It is our wish that this part of the exhibition be as varied and extensive as possible, in order that it may be made one of the prominent features. This is a matter of great importance. California, so rich in mineral wealth, should not be without a representation of the jewels that have made her famous, and still constitute her wonder of the world. Information regarding packages and forwarding cheerfully furnished on application. Respectfully,

A. CAMINETTI,
Secretary State Board of Trade.

The board also contemplates the issuing of a companion book to the "Fruit Industry of California," under the title of the "Mining Industry of California." In order to do so, information is needed as to the mineral resources of every county. A request has been sent to the boards of trade in every county in the State asking for an exhaustive description of the mineral resources of each portion of the State.

These are steps which should have been long since taken and should result in great benefit to the mining industry. It is to be hoped, however, that proper judgment will be exercised in the matter of the pamphlet, so that it will not be too voluminous or too "puffy" and that all our mineral industries will be considered. While our principal mining is for gold, there are 30 or 40 other substances mined for in this State, and in nearly all of them more could be done than is now the case.

There is plenty of available material for such a pamphlet, but its compilation should be entrusted to some one perfectly familiar with the subject and who can exercise suitable judgment as to what to reject. Our mineral resources are sufficiently important to bear investigation, and it is better that no exaggerated statements of any kind should appear. A properly compiled pamphlet would be of great utility, and all branches of mining should receive attention.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

ANTI-CALORIC CO., June 6. Object, to manufacture, use and sell non-conducting materials and substances, and establish warehouses for cold storage purposes in this State. Capital stock, \$500,000. Directors—J. C. Cebrian, Wm. Fores, W. Hanson, Frank McLaughlin H. M. Hanmore, Percy F. Morgan and G. C. Morgan.

GOLDEN GATE LAND CO., June 6. Capital stock, \$1,000,000. Directors—Behrend Joost, John Foley, William A. Dawes, John H. Ryan, Rudolph Mohr, Fabian Joost, Frederick C. Siehe, Henry Geilfuss, W. H. Nolan, P. A. Lux and Otto Fauss.

ALAMEDA M. & M. CO., June 11. Location, California. Capital stock, \$100,000. Directors—J. A. Hall, J. E. Shea, J. T. Landregan, Philip Monroe and W. C. Wright.

ESTRELLA VINEYARD CO., June 11. Capital stock, \$250,000. Directors—S. W. Ferguson, B. Marks, H. C. Campbell, M. F. Hudson and J. H. Barnard.

STANDARD WATCH & DIAMOND CO., June 11. Capital stock, \$50,000. Directors—J. J. Bryan, Leon Carreau, J. H. W. Harris, C. T. Swain and J. O. Scott.

CAPITAL INVESTMENT CO., June 11. Capital stock, \$100,000. Directors—H. P. Sontag, J. N. Knowles, E. R. Lillenthal, Leon Sloss and M. J. Newmark.

ACCUMULATION & INVESTMENT CO., June 11. Capital stock, \$150,000. Directors—C. O. G. Miller, H. M. A. Miller, John Coop, E. C. Hutchinson, J. W. Butler, J. D. McKee and W. J. Morgan.

THE ALASKA MILL & MINING CO. has applied to the Superior Court for a dissolution of the corporation, which was formed Dec. 1, 1861, with a capital of \$10,000,000 in 100,000 shares. The directors are: J. D. Fry, Edgar Mills, E. W. Hopkins S. L. Jones and William Alvord.

PACIFIC IRON WORKS, June 3. Capital stock, \$300,000. Directors—Ira P. Rankin, Willis G. Dodd, John Taylor, John R. Cross and S. O. Putnam.

CHESAPEAKE OYSTER CO., May 28. Object, to engage in the culture and sale of fish and in the canning industry. (Capital stock, \$30,000. Directors—W. S. Stevens, Thos. F. Morrison, C. H. Wood and C. E. Freeman.

NATIONAL ELECTRIC DEVELOPMENT CO., June 4. Directors—G. A. Davis, J. C. Turner, H. C. Miller, C. D. Cushing and C. J. Fallon.

GOLD AND SILVER EXTRACTION CO., June 4. Directors—Thos. Price, H. A. Powell, Arthur F. Price, H. J. Owen and L. F. Koch.

WORTHINGTON STEAM PUMPS!

Will Contract to Pump any Elevation at One Lift.

We are pumping through one continuous line of pipe 114 miles long against a pressure equal to 3500 feet elevation.

WE HAVE MORE PUMPING CAPACITY
SUPPLYING WATER WORKS

Than all other Manufacturers in the United States Combined.

WE BUILD PUMPS FOR EVERY PURPOSE
FOR WHICH PUMPS ARE USED,

And against pressures up to 8000 pounds per square inch.

Send for Illustrated Catalogue.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ores by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringements. For further particulars, address

ALMARIN B. PAUL,

Middle Creek P. O., Shasta County, California.

Coast Industrial Notes.

THE OTAY WATCH FACTORY, San Diego county, turned out its first watch recently.

THE loggers upon Puget sound have, it is estimated, cut and rafted this season about 320,000,000 feet of logs.

LARGE quantities of lumber are being sent by rail from Tacoma to the East at present, in addition to water shipment.

SAVS the Pasadena Star: Los Angeles county sends annually to foreign markets fully \$50,000 for butter and cheese. This is disgracefully wrong. We can and should produce every pound needed for home consumption, but are too lazy to do it.

THE new brick company has bonded a large portion of Carter's ranch, bordering on the water-front of Vallejo, Solano county, and will soon commence operations. The whole country is filled with the finest clay, and this industry promises to surpass all others in that vicinity.

THE Tacoma Mill Co. has out a timber of extraordinary length for a schooner now being built at this port. It is clear lumber 134 feet long, 24 inches wide and 18 inches thick. Two feet were cut from the stick, as it was too long, and it was then 132 feet long and contained 4750 feet of lumber, board measure. This is charged \$100 a thousand, so that the stick will cost the owners of the schooner \$475.

THE Callistote Company has been sold to an English syndicate for \$300,000. This company began in the most humble way. The wonderful article was discovered by Mrs. Emma P. Ellis, on her ranch near Callistote, Napa Co., Cal. She formed a company of women to put it on the market. One of the most remarkable things of this enterprise was the discovery of the great variety of oases to which this article could be put.

ARTHUR BROWN, superintendent of bridges and buildings for the Southern Pacific Co., will again go over the Central Pacific to the Sierra to look after the work of repairs to the snow-sheds which is now going on. This season's repairs to the 40 miles of sheds will cost fully \$250,000. Damaged sections are being rebuilt and timbers are being taken out and replaced to put the sheds in first-class condition for the coming winter.

THE Astorian says: It is reported that a belt of 20,000 acres of timber land in the vicinity of Buck Lake, in the southern part of the State and tributary to the Klamath river, has been sold to a New York syndicate at \$1280 per claim of 160 acres, and that the same syndicate had bonded 80,000 acres of very choice land in the same section for \$12 per acre. A large portion of this timber land was filed on by California parties. Gen. Russell A. Alger is one of this syndicate.

AN apiary on wheels is one of the latest innovations in this State. After the foothills have been pastured, the bee-herder moves his bees to a higher elevation, where the industrious insects gather the nectar stored in the blossoms of wild clover, chaparral, manzanita and other plants, and when these have been relieved of their saccharine matter the bees are again moved to a still higher elevation, where flowers peculiar to the region yield up their sweets to them. Migratory bee-keeping is said to be a success.

At the marble quarry in Inyo county, 30 carloads of marble are now ready for shipment. Different-colored marbles are in the lot, and all of them are very handsome. The new mill on the Truckee river is rapidly approaching completion and in a few weeks will be ready for work. The mill is within such easy reach of San Francisco that dealers and marble-workers need not carry large stocks, but can give their orders at the office of the company in San Francisco and have them filled as promptly as though the marble was kept in stock in the city. The beautiful marbles of this quarry are now so well known that there will be plenty of demand for them as soon as the mill is in operation.

THE North Beach and Mission street-car line will soon be substituted by a cable road at an estimated cost of \$2,000,000 for changes in equipment and construction of road-bed. The system extends from East street to California avenue, at the extreme southern end of Folsom street, and the cross-town route begins at Bay street and passes along Mason to Montgomery avenue, to Broadway, to Dupont, to Pacific, to Kearny, to Geary, to Stockton and to Fourth street, where it terminates at Townsend. This other department of the road extends from East and Market streets, up California to Kearny, where it is to join the line from North Beach. The present line from Montgomery street, down California to Battery, and along First to Folsom, will also be operated. Michael Skelly, superintendent of the road, has stated that the work of construction will begin early in the fall, and once begun will be completed as fast as possible. The equipment will not be surpassed by any other line in the city. The engine-houses are to be located on the corner of Fourth and Louis streets and on the west side of Folsom, between Army street and California avenue.

It is not generally known outside of the trade what a difference exists between the redwood products of the two great sources of supply, Mendocino and Humboldt counties. The latter, owing to its naturally richer soil, which

has stimulated and forced the growing tree to supreme efforts, produces a more porous, softer and coarser-grained wood. It is on that account more easily worked and recommends itself to millmen, who prefer the kind that "rips" up most easily and have nothing to do with the question of possible durability. Its very size, too, brought about as mentioned by the richness of the soil, enables clear boards of greater width to be sawn out of a Humboldt than a Mendocino log—that is, as a rule—and consequently it fetches about \$1 per thousand more in the local market. Some English buyers, on the other hand, prefer Mendocino redwood as a finer timber, while the Australian market, which calls for clear, wide boards principally, is mostly supplied from Humboldt.

MILLER & LUX, the Southern Pacific Company and Philip D. Armour of Chicago are preparing the plans for the erection of a million-dollar slaughter-house, packing-house and cold-storage house combined, which is to be of sufficient size to supply not only the entire Pacific Coast with dressed and packed meat, but is to reach out for business in British Columbia and other countries where there is a prospect for a market. The land east of the present railroad line and south of Hunter's point is largely owned by Miller & Lux, and it is on this tract, near the Fourteen-Mile House, that the packing-house will be constructed, providing the other arrangements are completed. Such a site will afford ready access to rail and water and will be far enough away from the city to preclude any opposition being made. The new company has two separate plans combined in the one great scheme. It is proposed in the first place to supply the coast with fresh meat of all descriptions, drawing cattle and other animals from California, Nevada, Oregon, Idaho, Utah, Colorado, Arizona, New Mexico and Texas. This meat will be dressed here and placed in cold storage, being shipped in lots to suit in a similar manner. This is the basis on which the beef business of the East is carried on, and the new company contemplates the absorption or retirement of all the Butchertown establishments. The second branch of the business will be the packing of beef and pork on the same scale and plan as it is done in the East.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

HARQUA HALL MINES.—A half-interest in the Buarza group of mines in the Harqua Hall district, 110 miles northwest of Phoenix, Arizona, has been sold. The property was owned by Frank Kirkland and Thomas Cochran of Phoenix, who receive \$37,500 for their interests. The new owners of the property are A. G. Hubbard and G. W. Bowers of California and C. H. Gay of Phoenix, who are said to represent heavy capitalists in Denver. The properties consist of seven claims, and are the same about which there was much excitement a year ago at the richness of the croppings.

A GAS EXPLOSION occurred on Sunday in the east crosscut of the 750 foot level of the Chollar mine, on the Comstock, by which Roger Pendergast and Wm. Owen were severely injured. The men employed about the mine are entirely at a loss as to how the gas got into the drift, as it is a new drift with new timbering. The only theory is that there is a crevice from some old drift leading into this one.

THE NORTON-COOK PRATT CO.—This company has established itself in the large store at 221 and 223 Market street. The members of the company have had long experience in handling sawmill and wood-working machinery, and will represent several well known Eastern manufacturers of these specialties. They will furnish estimates of the cost of wood-working plants of any kind on short notice.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MECHANICS' FAIR.—The gross receipts of the 24 fairs held by the Mechanics' Institute of this city have been \$1,182,496, and the net profit \$147,000.

FOR SALE.—AN ONYX MINE IN SAN Bernardino County, only about three miles from Railroad. Down grade from mine to the road. Price, \$5000. NOLAN & SMITH, 34 North Spring Street, Los Angeles, Cal.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE ROLLER ORE FEEDER

(Patented May 23, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works, Sole Manufacturers, 327 First Street, San Francisco, Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Holland's Corrugated Woolen Belt Ore Concentrator

(PATENTED)

Will save more fine gold and flour quick than any concentrator ever made. Will also concentrate cinnabar and gale ores perfectly and with economy. The invention is now and possesses all the advantages of the old blanket system, while avoiding its faults by the use of the Corrugated Woolen Belt, which is thoroughly cleaned by means of a revolving brush connected and operated with the machine. It is simple in construction and cannot get out of order. Small power is required to run it.

Price of Concentrator for Ten-Stamp Mill, \$1000; for Five-Stamp Mill, \$600.

For Circulars, address: H. P. HOLLAND, 2322 Folsom Street, San Francisco, Cal. Concentrators on exhibition at WILLIAMS & ORTON'S, Manufacturers, 315 Mission St., S. F.

THE PELTON WATER WHEEL THE GATES

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

Affords the Most Simple and Reliable Power for all Mining and Manufacturing Machinery. Adapted to heads running from 20 up to 2,000 feet. From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long distances with small loss, and is now extensively used in all parts of the country for generating both power and light.

APPLICATIONS

Should state amount, and head of water, power required, and for what purpose; with approximate length of pipe; also, whether the application is with reference to *Wheels* or *Motors* described below. SEND FOR CIRCULARS.

The Pittsburgh Boiler Scale Resolvent.

This Resolvent IS NOT AN EXPERIMENT but a FACT, and it will do the work claimed for it at a LESS EXPENSE than any other boiler purge, AND IN NO MANNER INJURE THE IRON.

CARNEGIE BROTHERS & CO., PROPRIETORS OF EDGAR THOMSON STEEL WORKS, PITTSBURGH, PA. WORKS AT BRADDOCK. Oct. 4, 1887.

We use the Pittsburgh "Boiler Scale Resolvent," and are well satisfied with the results obtained. We have tested nearly all Compounds presented to us, and this one is the only good thing we have ever used. Our feed-water is heated in Berryman Heaters, but owing to distance of heaters from boilers, we rarely exceed 150 degrees of heat in feed-water.

Our water is of the worst character, containing such bad impurities as sulphate of lime, carbonate of lime, mud, and everything that is bad.

Very truly yours, WM. R. JONES, Gen. Supt.

No water in the United States produces scale in greater quantity or of a harder nature than the Monongahela River, containing SULPHATE and CARBONATE of lime, iron, MAGNESIA, SILICATE, SULPHUR, ALUMINUM, etc. The following well-known manufacturers, who are large steam users IN PITTSBURGH, and using the water from said river as boiler-feed for all their boilers, USE THIS RESOLVENT in their steam plant, and to whom reference is hereby made: Carnegie Brothers & Co., Proprietors of the Edgar Thomson Steel Works; Dilworth, Porter & Co.'s Spike Works; and Oliver and Robert's Wire Co.; and many other firms in the great manufacturing center WHERE THE RESOLVENT IS MADE. Reference is also given to Robert McMahon, Boiler Inspector for Alleghany Co., Penn., and to the following Railway Companies who use it on their locomotives: Kansas City, Fort Scott & Gulf Railroad; Central Iowa; Mexican Central; Delaware, Lackawanna & Western; Burlington, Cedar Rapids & Northern, Terre Haute & Indianapolis; Mexican National; and Denver & Rio Grande Western.

Upon receipt of order, WITH THE PROMISE OF FAITHFULLY CARRYING OUT THE PRINTED DIRECTIONS, we will furnish, FOR FIRST INTRODUCTION, a Barrel, or Half Barrel, of the Resolvent, and the invoice will bear the following stamp:

{ TO BE PAID FOR WHEN RESOLVENT PROVES ENTIRELY SATISFACTORY. }

FOR SALE ONLY BY

Day's Improved Quartz Stamp Mill.

This Mill is designed for the Prospector, the Assayer and Sampler of Gold and Silver-bearing rock. It is a perfect mill, built entirely of metals, and of the best mechanical construction; will amalgamate perfectly in the battery or on plates. It strikes a sharp, heavy blow with a light stamp. Shipping weight, 225 lbs. Price \$75. Address

JAMES DAY, ATLAS IRON WORKS, Cor. Napa and Louisiana Streets, Potrero, SAN FRANCISCO, CAL.

N. B.—CHAPPELLE, Butte Co., Cal., Nov. 10, 1889.—Mr. Jas. Day, Chico: The little mill is a daisy; it comes up to all expectations, it works perfect in all respects. Yours truly, WALKER, REESE & CO.

Smelter For Sale or Exchange.

One 50-ton, wrought iron, water-jacket Smelting Furnace (38"x60" at the tuyeres) of the latest design, with Crusher, Blower, Boiler, Pumps, Engines, Tools, and everything complete for immediate delivery, and only used about six months. Cheap for cash, or will exchange for interest in a Lead-Silver Mine, or erect in any mining camp that will guarantee a certain output. For further particulars address Box 23, Elkhorn, Montana.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

KENDALL'S PATENT, AUGUST 24, 1886
CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:
1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on choco and dice.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction, We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as close as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and further information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIRS:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly, THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased. ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, JR.,
[Signed] Sup't North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

A Light and Power Plant.

The Roaring Fork Electric Light & Power Co. of Aspen, Colo., a part of whose plant is shown herewith, affords a very interesting application of water-power to the production of electrical energy and the convenient and profitable use made of it in mining operations. This was one of the first attempts on a scale of any magnitude to operate the various machinery required in mills and mines by electric transmission, and the success that has attended the venture has attracted wide attention.

These works are located near the thriving mining town of Aspen, in the heart of the Rocky Mountain range, a place of some 7000 inhabitants, having an elevation of nearly 8000 feet. The power plant consists of eight 24-inch Pelton wheels, which run 1000 revolutions under a head of 820 feet, with a maximum capacity of 175 h. p. each, aggregating some 1400 h. p. The power developed is made to conform to the requirements of the machinery run by the use of reducing tips, so that only as much water is applied to the wheels as is necessary to run the machinery to which they are attached.

Each wheel runs a separate dynamo, the connection being made by belt direct, without intermediate gearing. Close regulation is afforded by means of deflecting nozzle and hydraulic governor attached to each wheel. Water is brought to the station in a single line of pipe, consisting of 500 feet of 16-inch and 3500 feet of 14-inch, discharging into a receiver, from which short connections are made to each wheel.

The station is running 120 arc lights of 2000 o. p. each; also 2000 16 c. p. incandescent lights, the former being operated by the B'nsh

and the latter by the Westinghouse alternating current machines. These lights are distributed over an area of some four square miles, and are used for lighting the streets of the town, hotels, stores, private residences, etc. They are also used to a considerable extent in the mines, mills and sampling works in the vicinity. The electric-power plant consists at

present of one 60 h. p. and six 20 h. p. Sprague motors, which furnish power to underground pump, hoists, tramways, sampling works, etc., at distances varying from one to two miles from the station.

Some idea of the enormous power of these wheels, running under the conditions noted, may be obtained from the fact that the weight

of the wheels alone is but 90 pounds each, showing, therefore, a capacity of nearly two-horse power for every one pound of weight of material, and including accessories to make plant complete, such as shafting, pulleys, boxes, gate, nozzle, etc., the proportion would be 4½ pounds of material to every horse-power developed. The relative proportion in the best

type of steam plants would be from 400 to 500 pounds of material to every horse-power developed.

As regards the reliability of this power equipment, the statement is made that the wheels have worked perfectly without interruption from any cause since they were started. Considering the severe weather encountered at such an altitude during the winter season, this record may be considered as nothing less than remarkable. The statement is also made that no interruption of any moment has occurred in the electrical service, it having given entire satisfaction.

PATENT INFRINGEMENT SUITS.—The Judson Manufacturing Co. has filed a bill in equity in the United States Circuit Court, praying that Barge & Donahoe shall be enjoined from infringing on a patented cultivator and weed-outer. Zan Bros. & Co. have brought a suit of the same nature and in the same court against James Lirng for the infringement of a patented device in brooms.

HAULING A BIG REDWOOD LOG TO THE MILL.—See page 419.

ELECTRIC LIGHT AND POWER PLANT RUNNING EIGHT PELTON WHEELS WITH CAPACITY OF 1400 HORSE-POWER.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—EDS.

Mines and Mills of Shasta County.

NUMBER V.

[From our Traveling Correspondent.]

The next mill and mine moving southerly, is the "Central," owned by hanker Bliss and Mr. Whitehouse, of New York. This mine has a good record as far as the value of the ore goes, but, from what I learn, has been rather badly handled, in the way of expending the values in shipping large quantities of ore to various parts, instead of working it on the ground. This company have a large mill, a Huntington of the largest pattern, six Frue concentrators—with any amount of silver plates, and yet could not work the ore to a satisfactory per cent, from what cause I could not find out. The mill is run by steam-power and is located on the Sacramento river, and some miles from the mine, which is directly back, hauling being all down-hill. The mine has a fair opening by tunnels, at the same time there is not 200 feet vertical development on the lode. The size of the vein varies from 2½ to 12 feet; the rock carries a good quality of sulphurets, and at times pockets of free gold.

What this property wants is being opened in depth. At the present time there is but little work being done, but Mr. Anthony, the superintendent, expects to enlarge his operating force soon.

What seems so strange to your correspondent, is that in Nevada, Amador and Calaveras counties, where, as a general thing, the lodes are not more than half the size they are in this district, they will not be content until they are down from 300 to 1000 feet, while in this district, they keep skimming along the surface. Here, unless it pays from the start, the lodes have but location work. The history of California is, that the best mines never paid much, until after a depth of from 300 to 1000 feet was reached.

This Old Diggins district bids fair, on greater development, to be a very interesting and valuable section of Shasta county. It is a mineral belt about two miles in width, and how much over ten miles long I cannot say, all full of large and small lodes, some opened fairly, but the greatest number barely touched, and all claimed by people who never do even assessment work.

Gold in the Cascades.

Continuation of the California Mineral Belt.

EDITORS PRESS:—Having spent several weeks in the Cascade range directly east of this place (Seattle), on the Snoqualmie river, prospecting and making geological investigations. I find that section fairly good in mineral. The country has long been neglected on account of the difficulties encountered in prospecting it. The timber is exceedingly dense, the mountains being very heavily timbered, besides the shrubbery, herbs, and, in fact, all manner of vegetation, giving it an "Oregonian" if not an "Amazonian" appearance. It is needless to say the region has not been prospected for the simple reason that other parts of the globe present a more accessible and open field for the prospector's inspection. Here the great fir and cedar forests are indeed dark and dismal. It is hard labor to ascend these mountains, and, owing to the almost exclusive covering of the mountains with drift and soil, it is, as you can imagine, a hard country to prospect. The outcrops being obscured by superficial deposits, it requires skilled workmen to find mines in this section. The mineral-bearing formations are here, however, and good mines have already been found.

The geological formation of the country about the headwaters of the Snoqualmie is granite, gneiss, porphyry and diorite. The writer has observed valuable ledges of gold quartz, prospecting good in free gold, showing the native gold in visible particles, even without crushing and panning. Nor is that all; there are not only rich gold mines here, but also rich veins of silver, copper, lead and iron.

It is my opinion that good placer digging exists in some of the gulches, from the fact that I have obtained shot gold from the rim-rock, not being able to reach the lower bedrock on account of depth and water.

Am confident that in a few years this will be a famous mineral-producing country; the entire region between Mt. Baker and Mt. Rainier is favorable, geologically, for the existence of vast mineral wealth. After having spent 15 years in the Rocky mountains, I pronounce this field vastly superior for profitable mining to the continental divide. Here we have an abundance of wood and water, and the facilities for treating even base ores are second to none.

In conclusion, I predict a spirit of enterprise in the development of these Cascade mines exactly like that in general going on in this State.

The mines are here, and from those rugged mountains, over which the giant sentinel, Mt. Rainier, "looms inspiring" in "silence and awe," there will be untold millions given to the world.

CHAR F. BLACKBURN.

Seattle, Wash.

The Mines of Amador County.

[By Our Own Correspondent.]

Amador's reputation in gold-quartz mining has been established for so many years that it is not necessary at this time to go into a general history of her quartz-mining interests. Instead, I shall confine myself as briefly as possible to the present condition of the mining industry.

Jackson.

The Amador G. M. Co.'s 60 stamp mill is at present idle. The shaft is being put down from the 600 to 700 foot level, and the property put in shape to run. The heavy rains of the past winter flooded the mine and retarded operations. Mr. Darling is superintendent. Ex Senator Wallace of Pennsylvania and English capitalists own the property, which is a low-grade proposition, with plant to work it on an extensive and economical scale.

The Zelle.

Mr. W. F. Deter, superintendent, has been in operation since the "fifties." The No. 1 shaft is now down 1160 feet on the vein, with the shaft No. 2 down to 270 feet. The vein carries an average width of 25 feet, though the main ore-shoot is 40 feet in width and 500 feet long. The ores carry 2½ per cent of sulphurets. The mine is a low-grade proposition. The mill has 40 stamps, crushing 140 tons a day. The power is water and steam; that is, water, with steam auxiliary. In addition, the company has its own chlorination works of three tons a day capacity.

The Kennedy.

The Kennedy, Mr. J. F. Parks superintendent, is in very good ore, and the mine is paying handsomely. The mine is opened by two shafts, distant 600 feet from each other. The main working shaft, No. 1, is now down to 1150 feet. Shaft No. 2 is now down 1050 feet and will be put down to 1350 feet and connected with No. 1. The vein runs from 1 to 15 feet in width. The vein-matter carries 1½ per cent of sulphurets. At this time the quartz is generally reported as going from \$8 to \$13 a ton.

The mill has 40 stamps and 16 frues. Just below the Kennedy mill Mr. Geo. Gates has put in the Gates hydraulic concentrator to re-work the mill's tailings. The plant handles 90 tons every 24 hours. The 16 tables are 12 feet wide and 14 feet long. These tables are floors with a slight pitch covered with ducking, which is put on across the tables and allowed to lap. The tailings are distributed over tables by a series of perforated sluices. When the tailings have passed over the canvas for a given time they are shot off of a single table, and that ore dropped into a sluice, which carries it to an extra table which is used for that purpose above where it discharges, until the table from which it was shot off is cleared, when it feeds on to its regular table. The ore shot off, clear water is turned on, and the canvas allowed to clean itself of sand, when an end hoist is turned up, which carries the discharge into a sluice-mill with a special nozzle, that throws a flat stream of water. The tables are then washed down and when cleaned, the tailings turned on, and the adjoining table cleaned. By this method of washing, the tables are cared for by one man, cleaning a table in 30 seconds. I saw a table which had run one hour and twenty minutes, and when the sand was washed off, the canvas was covered with very fine sulphurets. The concentrates from these tables are re-cleaned in Mr. Gate's "Golden Queen" concentrator, which is a series of boxes, ten inches in width and seven feet in length. On one side of these boxes a metal trough is hung and the ore, flowing down the same, discharges through small perforations. About half-way down the trough, a stream of clear water discharges on to the tables. The table has a side-jar motion, the re-cleaned sulphurets discharging through two small openings to one side and in the floor of the sluice. The plant is the most extensive and complete of any canvas plant in use, and promises to be a success.

Six miles northeast of Jackson is a group of mines that have proved good properties. Among them are:

The Reid and Anskey Mine.

This property was closed by the storms. The owners have now interested outside capital, and the property is worked on a more extensive scale than heretofore. The gold from this mine is very heavy, the vein being both pocket and milling.

The Gardner, in the same vicinity, is arranging to build a 40-stamp mill.

The Kenzie mine is closed for repairs. The Huntingtons will start up as soon as the repairs are completed. The ores of this section run from \$6 to \$10 a ton, with veins from two to ten feet in width.

Sutter Creek.

The Summit mine was worked in the early days, when ores were not counted of value unless they ran very high in value. The property adjoins the old Eureka, and the best authorities in the county consider it an equally good property. The vein has been developed to a depth of 600 feet. The property is not operated at this time.

The Wildman.

The shaft is now down 700 feet. The vein runs from 5 to 30 feet in width. The ore carries 2½ per cent of sulphurets. The mill has 20 stamps and 10 more will be added. Four Tri-

umph and four Frue concentrators elbow each other for supremacy. Six Knight and one Donnelly water-wheels are used. One Knight hydraulic pump lifts the mine seepage from the 700-foot level. A 25-electric light plant illuminates the mill. Rix and Firth air compressor and power drills are used.

A sawmill for framing timbers will now be added. The batteries are of Knight's make. This mine was considered "no good," and was virtually abandoned when Mr. Tregloan, Sr., took it in hand and interested Boston capital in its merits. Under his management it has paid right along, almost all of the present plant being paid for out of the earnings of the mine.

The Mahoney property is owned by Valentine Bros. of S. F. At present it is idle.

The Lincoln mine is being worked under lease by S. P. R. Stewart and brother of the Senator. The mine is opened to a depth of 800 feet. There is a 40-stamp mill on the property, also a good hoist, though out of repair. This mine is considered as good as any in the county, and should be worked to its full capacity, but owing to some trouble among the owners, is now comparatively idle. The Satter Creek is hung up. I will have more to say of Amador mines next week.

E. H. SCHAEFFLE.

The Hart & Fleming Mine.

EDITORS PRESS:—I see in article No. 4 on "Mines and Mills of Shasta Co.," your correspondent says Hart & Fleming ore carries 1 per cent sulphurets. The average of the whole mine is 5½ per cent. The low-grade ore mill and concentrate carries 2½ per cent, or we save 2½ per cent concentrates, and they net us \$200 to \$250 per ton. This clear of working charges and freight. Ore we ship nets over \$100 per ton. Your correspondent says the lode is opened by several tunnels, the upper ones, however, being about worked out. No. 1 tunnel has a 3 foot ledge of good pay ore in the face, and a very small portion of the ground stoped out. The month of the tunnel is closed by a slide from the mountain, which came down during last winter, and we have not opened it since, but propose to do so soon. No. 1 is 330-foot level; No. 2 is 410 foot level. We have stoped considerable ore, but only a small portion of the amount developed. No. 3 tunnel is over our 530-foot level, and connected by winzes and upraises with Nos. 1 and 2, and is 700 feet long, and 300 feet of this in good ore, and a 3 foot ledge high-grade ore in face now, 2-foot gänge alongside on foot-wall.

Your correspondent says, one remarkable feature connected with this property is that it belongs to two preachers. He was misinformed, although one, Mr. Fleming, is a local preacher in the M. E. South Church. The original locator of the mine, Mr. Hart, is a miner and has been all his life, or since able to do anything, and has managed mines and mills for 30 years in different parts of the world. While he has not the honor of being a preacher, he is a layman in the M. E. Church and knows that mining business can be run, and successfully, without swearing.

In conclusion, we find our present method of working to be the most profitable to us. A smelter or to dry crush and chlorination on the ground would be the most profitable. We are now driving a No. 4 tunnel in 250 feet. When we strike pay and good ore in this, we will turn our attention to working the ore for permanent business. Hope you will pardon us for troubling you, we wanted you to have the facts, but don't care to advertise our business or appear in print.

HART & FLEMING.

Redding, Shasta Co.

THE El Dorado county slate quarries are increasing their output. An essential characteristic of good slate is plane of cleavage. It is of record that a piece of slate from El Dorado county one inch in thickness was split into more than 30 layers. The only quarries now being worked in are those of Calli Bar, 2½ miles from Placerville, on the road to Georgetown; the American river runs through the ground. Samples of this slate have been placed in the Mining Bureau and expert pronounce it of fine quality. The slate deposit, so far as can be determined by surface indications and openings actually made, is a large one. The qualities of the slate are the desirable ones of tenacity, elasticity, moderate hardness, and perfect cleavage. Another quarry was opened on this property in May, 1889, from which roofing slate in considerable quantity is being taken. The new California theater in San Francisco is roofed with slate from these quarries, and many contractors for new buildings in this city and other cities in different parts of the State have accepted the material for the same purpose. Slate quarrying is a comparatively new industry in California, but as the El Dorado article appears to be coming into general use, it is safe to predict that in time it will be an important one.

THERE is considerable excitement here over new finds of gold in Swank creek, near Elensburgh, Washington, one party taking out as high as \$60 a day.

THE United Verde Copper Mining Co. of Arizona has declared a dividend of 10 cents per share, or \$30 000. This is the first dividend since April, 1886.

The Gold Belt of Northern California.

Ancient River Channels and Gravel Deposits.

NUMBER II.

[Written for the MINING AND SCIENTIFIC PRESS by JAMES F. TALBOT, Shady Run, Placer Co.]

Mr. Amos Bowman, who was actively engaged in the geological survey of the State, and is scientific authority on the subject, wrote an article several years ago on the "Pliocene Rivers of California." He accounts for the changes from a scientific standpoint. He says: "The hundred transient volcanoes of the Sierra Nevada, associating themselves with things beyond, flamed up for a period and marked the end of an epoch."

He divides the successive changes into corresponding periods of time:

1st. The Pliocene or ancient eroding period which continued uniform for many thousands of years, and the gravel making era followed in succession and lasted thousands of years more before the present canyons began.

2d. The Pliocene filling of the canyons and rivers with gravel, or the choking and damming period.

3d. The volcanic period of the Sierras, when the gravel was capped with lava.

4th. The cold or glacial period.

5th. The modern eroding period, when the present canyons were cut out.

In regard to the first period, it is evident those canyons were cut out and the gravel and gold deposited in them prior to the volcanic period. Geologists have established a period of time when those ancient rivers existed, and, as we may suppose, drained the western slope of the Sierras and deposited the gravel and gold in the same way as the present rivers, although on a much larger scale and from the primitive source.

It is a self evident fact that this period ended when a succeeding one commenced. Existing conditions and development of facts indicate beyond a doubt that the succeeding period was the volcanic, and that all the changes referred to by Mr. Bowman are accounted for during this one period, except "the cold or glacial period," which, with due deference, I ignore altogether. Facts will be adduced hereafter to establish conclusively the co-existence of the "Volcanic, the choking or damming, and the modern eroding periods" of Mr. Bowman.

The "Progressive Theory"

Is based upon the views here expressed. In this connection, I will notice two conditions that have an important bearing on the modern erosions—grades, and a change of level. Geologists account for these changed conditions by uplift and subsidence. It must be evident that a change of level has taken place, or the present rivers and canyons could not be lower than the ancient ones. The geological ideas of the instability of the relations of land and sea may account for this change of level in this instance, by the uplift of the Coast Range, and concurrent subsidence of what is now the Sacramento and San Joaquin valleys, wherein the Pliocene gravels have sunk from 500 to 1000 feet.

Whatever the cause may have been, the fact remains. In regard to grades, in my opinion there has been no uplift of the Sierra Nevada that would perceptibly affect the grades of the Pliocene rivers within the gold belt since the golden gravels were deposited in their channels.

Abstract theorizing on this subject is to the miner like a well-defined channel filled with nice-looking gravel and no gold in it. What most concerns the miners of the day are facts that point with a degree of certainty to the existence, extent and direction of those ancient river-channels, on which, in connection with quartz, mining in the future depends. To illustrate this progressive theory in detail, I will select all of the well-known section of country, within the gold belt, lying between the Middle Fork of the American river and the South Yuba river. This selection is made for a purpose; that is, the topography and developed facts show that there are two separate and independent ancient channels within these limits, and that there is no direct connection, at any point, between them, and that from each one of those channels a system of gravel deposits has been formed as separate and distinct as the channels themselves.

The section of country between the Middle and North forks of American river contains one of those channels, and will be termed

The Middle Fork Divide

That portion between the North fork of American and South Yuba rivers. The others will be called the North Fork divide.

The country embraced in what is termed the Middle Fork divide is too widely known for its developments, workings and rich mines to require any notice now, but for comparison with the North Fork divide and for the purpose of showing that all of the conditions, developments and facts are in perfect harmony in every detail with the theory here advanced. In making a practical application of this theory to the Middle Fork divide, the first inquiry will be, what conditions are observed that determine the existence, the extent and direction of an ancient channel in this divide?

It will be noted here that the divide is sep-

arated into two prominent ridges by Shirt-tail canyon—Forest Hill ridge on the south and Iowa Hill ridge on the north. Running up the divide, the two ridges come together above the brimstone plains, about south from Damascus.

The fact of the existence of an extensive and rich channel in the Forest Hill ridge is so well established by actual workings that I presume no miner has a doubt on the subject. The conditions observed here are a deposit of bowlders and gravel on the bottom containing the rich pay above this cement pipe clay, and in places thick strata of small gravel, with but little or no fine gold in it; and over all, a heavy lava cap, from 100 to 500 feet thick, all inclosed within walls of hedrock. That these conditions are observed to exist along this divide for 25 miles or more is demonstrated to a certainty by deep shafts and long tunnels inside the rim rock from Spring Garden to near the Secret house, which determines the extent of this channel.

Where the bottom deposits are concealed within the hedrock walls, the lava cap inside the rim is the guide to determine the course. [In this description the points of compass are not strictly observed.] On the south side of the divide, along the head branches of Secret Black and Eldorado canyons, and down the Middle Fork below Spring Garden is a high rim of hedrock, except at points where the present canyons and modern channels have cut it away.

It is obvious, from the character of much of the material at those points, that it could not have been deposited in the present form and condition, only inside of walls of hedrock.

On The North Side of the Divide.

Opposite the head of Secret Canyon, on the south branch of the north fork of American, is a high rim of hed-rock that extends along the river bluffs and Humbug canyon, down to Damascus. Leaving the Iowa Hill ridge out for the present, and passing to the southward, a short distance below Damascus, you come to the Brimstone Plains, a high bed-rock country that separates the two great ridges. Shirt-tail canyon, takes its source in this high bed-rock country, and runs in high bed-rock on a south-west course to its junction with the North Fork, below Yankee Jim's.

There are no gravel deposits on this side of the divide. A slight break in the rim at Damascus above, and where Brushy and Devil's canyons cut through below, are the only outlets for gold from the hills on this side. Having traced the rim-rock on each side, without reference to the course from one point to another, it remains now to determine the course of the channel inside these rims, which is done approximately by following the course of the main lava flow or capping. It is an axiom that figures won't lie. In the N. E. Cor. of Town, 15 N., R. 12 E., Mt. Diablo Mer., between the head of Secret canyon and the south branch of the North Fork of American river, is observed a heavy deposit or capping of lava at an altitude of 5400 feet, and about one mile wide from rim to rim. This main lava flow or capping can be traced on a continuous course within the line of rim-rock heretofore described through the Townships of 15 N., 11 E., 14 N., 11 E., 14 N., 10 E., where, near the center of the western line of 13 N., 10 E., below Spring Garden (altitude 2500 feet), the lava channel and everything has been carried away by the present Middle Fork. By looking over a map of this country it will be perceived that this is nearly a due southwest course from starting-point and near 3000 feet lower.

The Gray Eagle Co.'s shaft at Spring Garden, now 300 feet deep inside the bedrock walls; the deep workings of the Mayflower Co.; the long tunnels through the rim at Damascus, Red Point and the Golden Fleecy; the deep shafts at the head of Black canyon; the Hazard on Volcano, and the long tunnels through the rim back into the rich gravel underlying the lava cap at Sunny South; the Breese & Wheeler claim at Bath, and the Dardanelles, with many others down to Todd's valley, demonstrate to a certainty the existence and extent of the channel and the course of the main lava flow here indicated—demonstrates with an equal degree of certainty the course of this channel through the gold belt on the Middle Fork Divide.

(To be Continued)

It is proposed to build large iron and steel reducing works at Kirkland, a suburb of Seattle, on the shores of Lake Washington. The company when formed will be known as the Oso Bay Iron Co., and will have a capital of \$1,000,000. Among those at the head of the great enterprise are: Gen. Russell A. Alger of Michigan; Peter Kirk, a member of Kirk Bros' great English iron establishment; D. L. S. Hunt, Bailey Galzer, Edward Bewett, Jacob Farth and other prominent capitalists. Mr. Kirk is now in the East getting machinery, and it is expected that the complete plant will be upon the ground within six months. The establishment of this plant means the development of the Squakmie and other iron mines in the State of Washington.

The Paris ring, at the time of its collapse, had 170,000 tons of copper. Now it has 60,000 tons, and prices are steadily advancing. The consumption, it is said, is exceeding the supply. The increased use of sulphate of copper, and the growing quantity used for electrical purposes and cartridges, have largely tended to bring about this state of affairs.

Water on the Pacific Coast.

Contamination in Storage Reservoirs and the Palliative Resorted to.

[The following paper was read recently before the American Water Works Association, by L. J. Le Conte, C. E., of Oakland. In this number of the PRESS we publish half of the article, and in the next number will give the remainder with drawings of the screens and appliances for purifying the water. —EDS. PRESS.]

Climatic Conditions.

The annual contamination of municipal water supplies, depending solely upon the catchment and storage of surface water, is a subject which naturally attracts more and more attention each year.

The experience gained on the Pacific Coast during the past 25 years is particularly instructive from an engineering point of view, in that the physical conditions, which tend to bring about deleterious changes in the quality of the ponded waters, are presented in their most exaggerated form. For this reason more than others the progressive change, which takes place from time to time, are naturally much more pronounced, and therefore more easily observed and studied. In order to be as brief as possible, consistent with clearness, I will confine my attention to the water supplies of San Francisco and Oakland, since they are truly characteristic.

In the first place, as to the climatic conditions. A very marked difference exists between the climate of the Pacific Coast and that of the Atlantic Slope in regard to the rainy season. In the former, the rain each year is usually delivered between November and May, soon after which time the streams generally become dry. The most favorable years give no water supply for half, or nearly half, the year, while a dry year gives no supply whatever, so that it may happen that no surface waters enter the storage reservoirs from March or April of one year to November or December of the next year, an interval of 600 days. The case may be even more unfavorable, due to a succession of three or four winters of small rainfall.

The engineer should not feel safe unless he has storage capacity for 900 days' supply. This fact compels the construction of very much larger storage reservoirs than would be necessary in other countries, in order to make allowance for the extreme features of the climate. As a final result, the works have to be planned so as to practically catch all the storm waters, and nothing is allowed to run to waste.

As to the quality of the water. Here again the natural difficulties are still further aggravated by the dry season occurring during the summer months, when the weather is very warm. This fact leads to extraordinary deterioration in the quality of the ponded waters, more particularly when the water level in the reservoirs gets to be very low. The regular cycle of changes through which they pass, year after year, is of great interest to the engineer, and is full of instruction.

I will next give a brief description of the water supplies being considered.

San Francisco Water Supply.

The city of San Francisco derives its chief supply of water from three large artificial storage reservoirs located in the Coast Range of mountains, and are known as the "Pilaritos," "San Andreas" and "Crystal Springs."

Pilaritos Reservoir.

This supplies the high-service system, and was built in 1864. Its capacity is 1,080,000,000 gallons above the dead-water line. Area of water surface, 115 acres; elevation 696 feet above high tide. Dam is earthwork, 95 feet high by 650 feet long. Depth of water at dam, when full, 85 feet. Direct watershed six square miles, and is all mountainous. Average annual rainfall, 50 inches. This reservoir is connected with the city by an aqueduct consisting of three tunnels, lined with brick and cement, having an aggregate length of 7870 feet; also 8300 feet of wooden flume and 69,336 feet of 30-inch wrought-iron pipe. This brings the water to Laguna Honda service reservoir, capacity 33,000,000 gallons at an elevation of 377 feet above high tide. Just before entering the reservoir, the water passes into the screen-house, where it is made to strain through a system of cloth screens, which will be explained in detail further on. The screened water passes from the screen-house into the service reservoir above mentioned. From here a 22-inch pipe delivers the water to the highest part of the city in the Western Addition.

San Andreas Reservoir.

This supplies the middle-service system, and was built in 1867. Its capacity is 6,690,000,000 gallons above the dead water line. Area of water surface, 525 acres. Elevation, 450 feet above high tide. Direct watershed, 41 square miles, and indirect watershed, drained by feeders, three square miles, and is all mountainous. Annual rainfall, 40 inches. Dam is earthwork, 93 feet high by 640 feet long. Depth of water near dam, when full, 89 feet. This reservoir is connected with the city by an aqueduct consisting of 3070 feet of tunnel lined with brick and cement, and 64,000 feet of 30-inch wrought-iron pipe leading into College Hill service reservoir, which is 253 feet above high tide, and has a capacity of 14,000,000 gallons. This reservoir also has a screen-house and system of cloth screens similar to that at Laguna Honda, and the water from the storage reservoir is always screened just before its entrance into the service reservoir. The San Andreas reser-

voir holds all drainage waters, and nothing goes to waste in the wet season. It never has been filled but once. The Pilaritos and San Andreas conjointly deliver to the city an average of 9,000,000 gallons per day, derived from 12½ to 13 square miles of drainage area.

Crystal Springs Reservoir.

This supplies the low-service system, and was built in 1877. Its capacity is 3,830,000,000 gallons above the dead-water line. Annual rainfall, 30 inches. The water service, 500 acres. Elevation, 268 feet above high tide. Direct watershed, 15 square miles, and is mountainous. Dam is earthwork, 50 feet high by 340 feet long. Depth of water at dam, when full, 46 feet. This reservoir is connected with the city by an aqueduct consisting of 8000 feet of wooden flume, 9000 feet of tunnel and 16.92 miles of 44-inch wrought-iron pipe. This brings the water to the University Mound service reservoir, having an elevation above high tide of 169 feet. Here again the water passes to the screen-house, where it is made to strain through cloth screens before entering the service reservoir. The Crystal Springs reservoir catches all the storm water, and nothing is allowed to run to waste. The aqueduct supplies on an average 22,000,000 gallons per day.

Oakland Water Supply.

The city of Oakland derives its water supply from two storage reservoirs constructed on the adjoining foothills and known as the San Leandro Reservoir and the Temescal Reservoir. The latter is quite insignificant, and the chief supply is taken from the former, which we will now describe.

San Leandro Reservoir.

This reservoir was built in 1875. Its capacity, 4,300,000,000 gallons above the dead water line. The water surface, 410 acres and has an elevation of 225 feet above high tide. The watershed, 40 square miles and is mountainous. The dam is earthwork and 100 feet high by 450 feet long. Depth of water at dam, when full, 90 feet. The water on leaving the lake passes through the ordinary fish screen and then enters a double line of 24-inch wrought iron pipe, but flows only a short distance before reaching the screen-house, where the water is made to pass through cloth screens, to be described further on. The screened water falls into a clean water basin. There are two of these basins, 800,000 and 2,000,000 gallons respectively. They are not covered. The water leaves these basins to enter into a large 37½ inch supply main leading to the city of Oakland, a distance of nine to ten miles. On arriving in the city the water is delivered to consumers direct, no local service reservoirs being employed.

The above gives a fair idea of the main features connected with these several reservoirs. It is well to mention that all of them are more or less stocked with fish, principally California and Eastern trout, also black bass, catfish, carp and white fish from Lake Michigan.

General History of the Annual Trouble Affecting the Quality of the Pond Water.

The writer has devoted much attention to this subject during the past five years, and has made many experimental observations and tests. I shall only mention those which have been carefully verified. I will begin my statement of facts in regard to the cycle of changes, which takes place year after year, by commencing in the winter, thence to the spring, summer, and finally to winter again.

Troubles in the Reservoirs.

Ordinarily in the winter and spring months, which is also the wet season, the quality of the water in the storage reservoirs is comparatively good, the temperature averaging, surface water 48° and bottom 50° Fahrenheit, the only objectionable feature being periodical turbidity due to fine loamy sediment, which is brought in by tributary streams. As soon as the stormy weather is over, the water rapidly becomes clarified by natural subsidence, the time required to complete this operation being generally two to three weeks. In the case of the San Francisco water supply, this difficulty is obviated by shifting the supply to some other source less affected. In the case of Oakland this is not practicable, since both the reservoirs are equally turbid about the same time, and as a result the muddy water goes into the pipe system and direct to consumers.

The Fermentation Stage.

As the season advances, the rains cease and the streams run dry. About the 1st of May of each year, the surface water in the reservoirs have acquired a temperature of 62° Fahrenheit, and the bottom water, say 50° Fahrenheit; all vertical circulation has stopped and the period of stagnation begins. Water fleas and some vegetable matter, mostly phytoplanktonic plants, begin to show themselves to a limited extent in shallow water along the margin of the reservoirs, but not in sufficient quantity to amount to anything. As time progresses and the waters get warmer, the next change observed is a chemical one, that is to say, bubbles of carbonic acid gas and light carburetted hydrogen rise up from the bottom to the surface, the temperature of the bottom water gradually rises, and in course of time attains the same temperature as the surface, say 65° Fahrenheit.

It will be as well, perhaps, to mention here that the true cause of this change has been traced conclusively to the fermentation of the immense deposits of mud covering the entire bottom of these reservoirs, averaging ten feet

in depth. This bed of mud, of course, has been many years in accumulating. Repeated examinations show that it is composed of animal and vegetable matter in all stages of decomposition.

The True Cause of Rank Vegetable Growths.

Now then, as a result of this fermentation, the waters of the reservoirs become highly charged with carbonic acid gas, and are robbed of free oxygen as well. Now what do we observe to be the next characteristic feature? Just precisely what might be expected; namely, a sudden and wonderful development of vegetable life, followed almost simultaneously by an equally wonderful development of animal life, principally in the form of water fleas. This vegetable life seems to belong mostly to the variety of cryptogamous plants known as algae. Later on when they reach maturity they break up and develop millions upon millions of tiny green spores, which eventually permeate the whole mass of the ponded waters, imparting to them a beautiful green hue. When these conditions obtain, the spores become a source of great annoyance. They readily pass through the screening apparatus and enter the pipe system in which they die and decompose, thus injuring the quality of the water delivered to consumers. It is well, perhaps, to mention here that these two items of contamination, vegetable and animal life, at first do no harm whatever to the quality of the water, while they are healthy; on the contrary, their presence in such prodigious quantities is nothing more than nature's endless effort to purify water, which has been previously injured in quality, and, furthermore, they would most certainly continue to perform this useful function in nature but for the advent of the next stage in contamination—we will call it the "Fatal Stage"—and which is most disastrous in its results by giving rise to pernicious conditions, which lead to their death and subsequent decay, all of which is utterly ruinous to the quality of the ponded waters. The main characteristic feature of the fermentation stage above mentioned is the fact that the gases developed give rise to no offensive odors of any kind.

The Fatal Stage, or Putrefactive Stage.

The next change noted in the reservoir is also a chemical one; namely, the fermentation of the bottom mud increases in activity, and in course of time becomes converted into putrefactive fermentation. This stage is at once detected by the change in the quality of the evolved gases rising from the bottom, which now become very offensive. Examination shows them to be carburetted hydrogen, carbonic acid, sulphuretted hydrogen. By this process the water in the reservoir soon becomes robbed of nearly all its free oxygen, as instanced by the fish at all times swimming at and near the surface, and becoming very languid in their movements.

During the first portion of this putrefactive stage it was observed that the algae and animal life were both doing their utmost to purify the water, but as this stage advances the fatal by-products of putrefaction, certainly sulphuretted hydrogen, and possibly septic poisons, begin to gain the upper hand, and finally the conditions become so bad that they give up the battle, break up and die and decay in large quantities.

This melancholy condition is called to your attention by masses of dead algae forming great reddish-brown blotches here and there on the water surface, mostly where the gases bubble up in abundance. These blotches soon sink to the bottom, thus adding new fuel to the putrefying matter in the bed of the reservoir. The above lamentable state of affairs exists to a greater or less degree during the months of August, September and October of each year, when the water is at the low stage, and at such times the quality of the water in the storage reservoirs is something almost incredible.

As the season advances, the first change for the better is noticed about the last of October or first of November, when frosty nights set in, and the surface waters become chilled and sink to the bottom, thus giving rise to vertical circulation, which cools the entire body of water, and thus greatly checks putrefactive fermentation, and as a result the offensive odors are greatly reduced.

Chemical analysis made at the beginning of this vertical circulation shows that the quality of the water is actually worse than at any other time during the year. This fact is undoubtedly due to the filthy bottom waters coming up and mixing with the surface water, thus spoiling the supply to consumers, which, you may say, is always taken from at or near the surface.

But no decided relief from bad water is experienced until the rainfall begins, generally in November, when the reservoir becomes filled up again with a fresh supply of cool surface waters, and the temperature is reduced to 55° Fahr. This fresh supply of rain-water is always turbid. There are one or two very important facts connected with these storage reservoirs, upon which I should lay great stress, namely, the San Francisco and Oakland storage reservoirs are equally bad as to quality in midsummer. On the contrary, there exists a very marked difference in the quality of the water as delivered to consumers in the two cities, and this important fact seems to be due unquestionably to the treatment which the water undergoes after it leaves the lakes. This naturally leads us to the next subject.

(To be Continued)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NORTH STAR.—*Ledger*, June 14: The following statement of receipts and expenditures for the past year ending June 1st was presented to the annual meeting held last week:

Balance on hand as per last annual report.....	\$ 1158 99
Six assessments, 13 to 18 inclusive, at \$2000 each.....	12,000 00
Total.....	\$13,158 99
Expenses.....	
Construction.....	\$ 341 66
Labor.....	9,018 50
Mine supplies.....	458 68
Timbers.....	149 50
Water-power.....	728 00
Lumber.....	46 54
Powder, etc.....	713 55
Real estate.....	202 29
Incidental.....	176 87
Total.....	\$11,735 59

Balance on hand June 1st..... 1,423 40
Average monthly expenses..... 977 96

The shaft was sunk 207 feet, with 557 feet of drifts and crosscuts, at an average cost of \$15.50 per foot. The total sinking is 922 feet. All developments so far show indications that the mine would prove better at greater depth, so the directors of the corporation decided to suspend all explorations at the 600 and 800 foot levels and sink to 1000 feet and there make a thorough prospect, which, judging by other developments along the mother lode, promised to secure success, having an agreement with the original owners of the North Star mine for an extension for one year on first payment as per agreement, April 1, 1889. The assessments have all been paid without any being delinquent.

MCKENZIE.—McKenzie Bros. have sold their mine near Irish Town to the company represented by Robert Stevenson. We have not heard the price agreed upon, but understand that the money is to be paid in monthly installments, the purchasers first paying off all indebtedness against the property. A ten-stamp mill is to be erected, and thus equipped there is every reason to think that this mine would soon get on a paying basis. The sale also includes the Ratto ranch.

MISCELLANEOUS.—C. Lavezzo made a cleanup of his mill near Pine Grove and realized between \$600 and \$700. The mill of the Amador gold mine is kept running to about one-half its full capacity. The track will need considerable alterations before it can be made to run easily. It takes several men attending to the cars instead of being self-operating as intended. At a meeting of the directors of the Alpi M. Co. held Tuesday last, it was decided to divide the small sum on hand pro rata among the stockholders and wind up the company's affairs. The Cosmopolitan mill is running on rock from the Drytown Consolidated mine. Parties who ought to know say the plates are looking quite as well as could be expected, and indicate a yield of from \$3 to \$4 per ton in free gold.

SETTER CREEK.—Cor. Amador *Ledger*, June 14: Mining has taken another upward step. Since my last, encouraging reports are in circulation that the claim a short distance up the creek, known as the old Rose mine, is to be started up by Messrs. Hayward & Hobart, after 22 years of inactivity. L. R. Poundstone, who is interested in the property, has been here during the past week, and it is understood he will have the management. The old shaft, 100 feet deep, sunk on the ledge, is to be cleaned out, enlarged, and made perpendicular. Sinking to be prosecuted until a depth of 300 or 400 feet has been attained. Mr. Poundstone worked the mine in early days, and says there is an abundance of \$4 rock, which with modern facilities will pay handsomely. Operations will commence as soon as timbers for the shaft can be procured, which will probably be in a few days. F. A. Howard is to the fore with a water-wheel, which is the old Donnelly wheel considerably changed. The buckets and wheel constitute one casting. The buckets are small, intended for high pressure. A test is to be made of this wheel at the Utica mine, Calaveras county, which is expected to develop the superior merits of the invention.

ACCIDENT AT THE LAMBING MINE.—*Dispatch*, June 14: About 7 30 P. M. or shortly after the night shift, consisting of Robt. Jones lever tender, M. Coombs engineer, and John Loskill, commenced work, quite a serious accident occurred at the Lambing mine about three miles from Ione, which might have ended fatally. The back guy of the derrick (which is wire cable) parted just as a bucket of gravel was being hoisted, causing the 110-foot boom and pilot-house to fall to the ground. Jones, who did duty in the pilot-house, which had a 40-foot fall, fell from his position when within a few feet of the ground and miraculously escaped being crushed to a pulp; as it was he escaped with a slight fracture of the skull above the temple, a badly injured shoulder and several bruises. Coombs, who was in the engine-room at the back underneath the pilot-house, was twice floored by falling timbers but not seriously hurt. Mr. Loskill escaped without a scratch, thanks to a quick pair of heels, but he returned immediately and had the injured man taken to the boarding-house, where he was attended by Drs. Adams and Sterriker of Ione, and is getting along as well as can be expected. The derrick, which is the first the company had, which cost \$15,000, is a total wreck.

Nevada.

THE INX MINE.—*Transcript*, June 13: The company represented by Mr. Campbell and which has since last summer been prospecting the INX quartz mine, seven miles above Washington, quit work there a few days ago, after having paid \$6000 on the purchase-money, built an eight-stamp mill, constructed roads and done considerable underground work. This action on the part of the company is said to be based on an unfavorable report on the claim made by John Hays Hammond, who went up there a short time ago and expeted it.

George J. Binder of Oakland, and his partner, who are the owners of the property, and to whom it reverts now that the parties holding the bond have quit, will carry ahead the labor of opening the ledge, and experienced practical miners say their chances for success are favorable. Mr. Campbell, who is an energetic and clear-headed mining man, has not bad his faith in the mineral resources of Washington district shaken by the turn the affairs of the INX have taken, and he will probably take hold of some other ground up there.

THE CENTENNIAL.—A letter from Superintendent Richards to the company's office at Virginia City states that he is making excellent progress driving ahead in the new tunnel, having two shifts of men working. The hard formation encountered is changing to softer material, with favorable indications. The San Jose Co., adjoining, have also resumed operations for the season, and as soon as they can pump out their shaft and get things into practical operation they will commence taking out the rich gravel gold deposit they struck just before the heavy winter snows made them shut down.

MINING BRIEFS.—*Tidings*, June 13: The Emmett Water and Mining Co.'s shaft, adjoining the Evening Star, is down between 80 and 90 feet. It is a double compartment and is timbered to below 60 feet. Since the shaft has been in hard blasting ground, a three-foot ledge of fine-looking ore has developed. Supt. McSherry says that machinery will arrive by the time he is ready for it, about July 1st. The Crown Point mine was started up Friday. Nothing new underground. Cleanup at the North Banner to-day and pay-day to-morrow. The ledge in the bottom of the shaft and in the drifts is three feet thick and of high-grade ore. The mine never before looked as well, and dividends will undoubtedly follow the opening up of another level.

Calaveras.

MURPHYS NOTES.—*Calaveras Prospect*, June 14: At the North Fork mine, one-half mile south of Murphys, of which Frank Monroe is superintendent, a 15-stamp mill and two pulverizers are being put up, which will be equal in capacity to a 35-stamp mill. At the Total Wreck, one mile west of town, owned by Mr. Campbell of San Francisco, an excellent quality of quartz is being worked. The shaft is 150 feet deep, with a steam hoisting works at the mine, and a 5-stamp mill near town, which is to be increased at once to 10 stamps. The owner is now on the grounds.

Placer.

THE DIVIDE.—*Placer Herald*, June 14: Our industries being principally mining, we are more interested in that line than any other. I have to note the continued prosperity of those industries, our paying mines continuing to yield their usual quota of bullion. Messrs. Breece & Wheeler visited their mine the past week, both looking in good health and spirits, well pleased with the output from their mine under the superintendence of Mr. Grinnell, who is now employing about 25 men. The Drummond mine at present seems to take the cake, working to the full capacity of the mill in ore so abundant that the superintendent has dispensed with the night shift; the whole body of the ore yielding \$3 per ton. This to the proprietor means a fortune. It is rumored that the Mayflower will be ready to put on a full force in a few weeks. At present they are engaged in running tunnels preparatory to opening up the mine in the large body of gravel from the immense river-bed extending through their property. The Gray Eagle is pushing its tunnel ahead at the rate of 300 feet per month and expects to strike the body of pay gravel by October.

IOWA HILL.—Cor. *Placer Herald*, June 14: While we do not make any great outcry, I think Iowa Hill holds its own with most of the small mountain towns. The Morning Star mine keeps on the even tenor with a moderate crew of men, under Mr. H. Simons; the Waterhouse & Dorn is reported having the richest cement in sight that they ever had, and I have seen some from there which was very rich. The Drummond mine, near Cottage Home, in spite of the predictions of many soreheads, has been a paying property all winter, although the extra expense incurred on account of deep snow was very heavy. The new tunnel is progressing rapidly and the expectation is that the ledge may be struck inside of 50 feet. The Pioneer is also making over expenses, though they were handicapped by the deep snow also. Red Point is reported as doing well and about to start; the Burleighs soon to extend the main tunnel. I hear that a contract has been let to push the New Basil bed rock tunnel in Black Canyon 400 feet, to start immediately. Reports from Canada Hill and Sailor Canyon are meager, yet hopeful. There are several small mines near here which are worked by their owners principally, which are reported as doing fairly well. Among them are the Watts mine at Monona, Tommy Dick, at King's Hill, and others.

Plumas.

THE BLIND LEAD MINE.—*Greenville Bulletin*, June 11: About two years ago, Archie Warren and John McIntyre struck a ledge of good ore on Wolf Creek near the Wisconsin mill. A tunnel was driven into the hill 230 feet. At first the vein seemed to lie nearly flat, and in following it, the tunnel was run on an incline a part of the distance, until the amount of water rendered further progress impracticable. At the end of this 230-foot tunnel, the ledge stands at an angle of 45 degrees. A second tunnel was started last fall, about 60 feet below the first, and driven under the vein. About ten days ago, an upraise was made for the purpose of tapping the ledge, which was reached after going 15 feet. Mr. Warren informs us that the body of ore is from six to eight feet wide, and that it prospects about \$10 per ton. Considering the inclination of the ore body and the depth of the lower tunnel from the surface, he estimates the backs at about 300 feet. Messrs. D. McIntyre and Archie Warren, the owners, think they have a fine property. It will be remembered that the Gold Stripe Co. had some very rich ore in that vicinity. It is thought that this discovery may be fully as rich and more extensive.

A BRIGHT OUTLOOK.—*National*, June 14: Harley Flournoy informs us that the Genesee mine and Brandt mine are in full operation and showing up well. A party from San Francisco have made a quartz location, and have prospected it enough to feel assured that they have a good mine. The party passed through town on their way to San Francisco, but will return in about a month to put up buildings and commence work to

develop it. It will be but a short time before Plumas will step to the front as the leading mining county of the State.

Shasta.

A DAY WITH A PROSPECTOR.—*Redding Free Press*, June 11: We spent last Sabbath in the hills. Leaving Redding about 6 o'clock, we walked up the railroad track a quarter of a mile above Middle creek, where we were met by Mr. Connor and his son, owners of the Sky Blue mine. With these gentlemen we took an extended tramp, visiting many prospects and gaining a general idea of the mining resources of the section between Old Diggings and the Hartman mine (in the Lower Springs district). Among other prospects we visited the famous Scherer mine on Salt creek. An engine and pump near at hand indicated that the shaft would soon be cleared of water. Below this hole is an open cut leading from the creek, and a fine tunnel 200 feet long into the mountain. Entering the tunnel, we saw two miners drilling holes in the hard, birds-eye porphyry, preparatory to blasting. They informed us that a distance of 450 feet would tap the shaft. We had occasion to cross the old Bunker Hill ground, which at an early day produced tubs full of quartz and rusty gold—a veritable bonanza that was taken out and expended in litigation. After \$80,000 had been extracted the pay chute was lo't, and has never been discovered, although diligent search has been made. Near the Bunker Hill mine can be seen quite a number of prospect holes and indications of surface mining, prosecuted years before with profit. The developments made in the Sky Blue indicate a bright future for this mine. In a northerly direction, all the way over an almost level country to Quartz Hill, can be seen indications of placer-mining, and the quartz croppings close by plainly show from whence those placers were fed. It has been said that "the mines of Shasta do not go down," but the mining done in this section would convince a reasonable man that the miners, and not the mines, do not go down.

SIERRA BUTTES.—We understand that the Sierra Buttes M. Co. on Squaw creek made a cleanup last week after running a month, and that the amalgam was more than any one man in the camp could lift.

Sierra.

GARIBALDI.—*Mountain Messenger*, June 14: The Garibaldi mine at Gold Valley is paying very well. The last run the rock crushed paid about \$17 a ton.

Trinity.

A BIG MINE.—*Journal*, June 14: Last Saturday, in company with a party, one of the *Journal* force found Supt. Loveridge and the efficient foreman, C. E. Goodyear, with the working crew as busy as bees. The immense bank of gravel is being plowed away as fast as the three hydraulic monitors, running 12 hours a day with from 150 to 360 feet pressure, can do it. The face of the bank is now 80 feet and will shortly be 150 feet. The bedrock ditch and eight-foot flume (with undercurrent) have a good and sufficient grade, and no trouble is encountered by either getting blocked. Everything about the mine is in ship-shape style, and nothing is lacking at present in which to work to an advantage and get the full benefit of the supply of water, which will last for several weeks more. As the company are now working as good, if not better, gravel than they have for years, a flattering cleanup is more than probable. The company own 400 acres, and in charge of Supt. Loveridge we went over some of the ground, following the channel leading from the place where the mine is now being worked to the reservoir on the top of the mountain, a distance of one mile. The auriferous gravel can be seen, from the surface down, where the water has cut deep into the channel all the way up to the reservoir, but no sign of bedrock is visible; and right on top of the mountain, where the two ditches empty into the reservoir, is a bank of gravel perhaps 100 feet high. The depth of the gravel in the channel which the company have just faced is estimated to be from 100 to 500 feet, and with the present supply of water would take centuries or more to work. Owing to the misfortune of portions of the ditches sliding away, the loss of water caused the company to lose three months' work, but nevertheless they will make a good showing this season.

CANYON CREEK QUARTZ.—*Journal*, June 14: Geo. Bailey informs us that work is progressing satisfactorily on the mines and locations on Canyon Creek. Work is being pushed on the mines in which he is interested with Grant Flowers and C. W. Smith. A tunnel is being run and it is now in 61 feet. The ground is well suited for tunneling, and the tunnel progresses at the rate of over four feet a day; it is expected that the tunnel will tap the middle ledge within a distance of 30 feet. The tunnel will tap the lower ledge at a depth of 175 feet, and the back ledge at a depth of about 300 feet. The rock in the three ledges carries free gold and prospects well. The gold is heavy and easily saved. If the development work turns out as satisfactorily as expected, a mill will be erected this summer. Carlson, Dedrick & Benjamin have begun work on their ledge and have a good prospect of finding a good mine. Grigsby & Shock are at work on their locations and have first class prospects.

NEW RIVER.—Jas. Mullane of New River says that the past winter in New River was very severe and but little work was done, hence times have been rather quiet this spring. The different claims are now being worked and business will pick up the coming summer. At present the following mines are in operation: Mountain Boomer, Ladd & Clements. Tunnels are being run and ore taken out; the ledge is not large but rich, and the mine is a good piece of property. The ore is being crushed in the company's stamp-mill. Mr. Colgrove is working on the Excelsior, taking out ore and developing the mine. The Irvin mine, found one year ago, is showing up well; quartz crushed from it has averaged over \$75 a ton. Irvin & Ladd are the owners, and they are now running a tunnel to tap it at a lower depth. The rock is crushed in the Mountain Boomer mill. Gulick & Bowles in the Uncle Sam are taking out rock, crushing and running development tunnels. Stephen Sherwood in the Sherwood mine is taking out rock and crushing by arrastra. Fairburn & Co. are taking out ore and doing general development work on the Tough Nut. At present there is too much snow on the Mary Blaine mine for work to be resumed. There will be plenty of water to run arrastras and mills all summer and a good season's work is looked for.

Considerable quartz was taken out last fall and piled up to be crushed, but the heavy snows came and it could not be worked. This will be run through and more taken out and a prosperous season is looked for.

Tuolumne.

GOLD FROM THE BONANZA MINE.—*Union-Democrat*, June 14: One day during this week Nelson Williams picked up several pieces of quartz on Sheppard street, at the lower end of town. They were worth about \$60 to him, that amount of gold being subsequently extracted from the quartz. The rock came from the Bonanza mine, it being used in repairing the street in that locality. Quite a number of boys have succeeded in making small "finds" since gaining a knowledge of Mr. Williams' luck.

POCKET.—*Tuolumne Independent*, June 14: Messrs. Jas. Stone and Pedro struck a fine pocket in their mine on Brown's Flat, Friday of last week, which still holds out. The gold is pure and in abundance, coming out in numerous beautiful shapes, many pieces resembling strips of crinkly ribbon. The mine is owned by Mr. J. G. Pedro of Jamestown, and is leased from him by Messrs. Stoe and Pedro of Brown's Flat on shares. This pocket will, no doubt, reach up to many thousand dollars when it is all taken out, which will add new laurels to what has been a good-paying mine for years.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Enterprise*, June 14: The west crosscut on the 630 level still continues in a mixture of quartz, clay and porphyry.

UNION CON.—East crosscut No. 1 on the 1465 level is making the usual progress. The north lateral drift is rapidly advanced.

MEXICAN.—West crosscut No. 5 on the 1465 level is in vein porphyry that is beginning to show streaks of quartz.

OPHIR.—On the 1300 level the winze at a point ten feet southwest of the raise is down 21 feet in porphyry carrying low-grade quartz.

UTAH.—The raise going up to the 600 level is still in quartz.

ANDES.—Past week 500 level north drift from No. 2 west crosscut extended 15 feet; formation, quartz and porphyry. On 350 level, west crosscut extended to 260 feet; formation, hard porphyry.

SILVER HILL.—On the 1600 level the east drift has penetrated a formation that carries a promising amount of metal.

JACKET.—A good deal of exploring work is being done in ground that promises well. Are still making regular shipments of ore to the Brunswick mill, Carson river. The ore averages over \$20 a ton.

SEG. BELCHER.—The 1000 raise from the No. 1 east crosscut is up 45 feet, having advanced 30 feet during the week. The top is in low-grade quartz. The joint 850 east crosscut is out a total distance of 550 feet, having been extended 31 feet since last report. The face is in hard porphyry.

ALTA.—The mill continues to be run to its full capacity. The ore worked averages \$22 a ton. The ore-producing sections of the mine continue to look well.

EXCELSIOR.—On the 500 level the east crosscut is making good headway. The face is in quartz and porphyry that yields low assays.

SAVAGE.—During the week we hoisted 530 cars of ore; shipped to Rock Point mill 443 tons and milled 454 tons; average battery assay, \$19.05. We have bullion on hand and at the mill amounting to \$7046.60.

SCOKION.—The southwest drift on the 630 level still continues in a favorable formation composed of a mixture of porphyry and clay.

CROWN POINT.—Shipped to the mill during the week 795 tons 1350 pounds of ore, the average battery assay value of which was \$19.40.

ALPHA.—On the 500 level the west crosscut continues in vein porphyry. On the 600 level the east crosscut is still being extended in a favorable formation of quartz, clay and porphyry.

IMPERIAL.—West crosscut No. 3 from the north lateral drift from the 500 level is out 48 feet, 10 feet having been made during the week, the face showing low-grade quartz.

HALE & NOKROSS.—Are working on the 500, 800, 1250, 1300 and other levels. At several points low-grade ore is showing, and some of these are likely to lead to paying deposits. A good deal of ore is being mined on the 1300 level. The usual amount of ore is being reduced at the Nevada mill—about 1100 tons a week. The ore averages \$20 a ton. There is bullion on hand and at the mill valued at \$18,454.

NEW YORK CON.—The usual prospecting work is being done on the 650, 800 and 900 levels. On the two latter levels some ore of low grade is being encountered. The general outlook at the mine is favorable.

NORTH OCCIDENTAL.—Are still doing repair work.

JUSTICE.—Considerable ore of a good grade is being developed at all points on the 622 level. On the 490 level explorations are being made in fertile ground and some fair ore has been found. The usual amount of ore has been shipped to the mill, and the average assay will be about \$27 a ton.

CHOLLAR.—Good ore is still showing on the 750 level in No. 1 crosscut. No. 3 crosscut is in a favorable formation. The north lateral drift on the 950 level continues in vein porphyry.

CHALLENGE CON.—The joint Confidence-Challenge-Imperial north lateral drift from crosscut No. 1 on the 1000 level (Yellow Jacket 800) is in 30 feet, 25 feet having been made during the week; face showing low-grade quartz. The joint Confidence-Challenge west crosscut from the top of the raise on the 700 level (Yellow Jacket 500) is out 41 feet, 31 feet having been made during the week; face showing low-grade quartz.

OCCIDENTAL CON.—The stopes on the 400 and 450 levels continue to yield ore of a good quality. The winze on the 506 level still shows good ore. The main north drift on the 650 level is showing ore of low grade.

POTOSI.—The winze on the 930 level is making good progress. The bottom is in low-grade ore of good appearance. On the 850 level the prospecting drifts are showing well. The outlook in all parts of the mine is favorable.

CON. CAL. & VIRGINIA.—Work is being done on the 1000, 1200, 1300, 1435, 1500 and 1650 levels. On the 1435 level are following a promising streak

of quartz a foot in width that lies on the west wall. Some good ore is being found on the roo level in the old stopes. On the 1550 level ore is being extracted at several points. The usual quantity of ore has been shipped to the mills on the Carson river, and the average value will be about \$23 a ton.

BELCHER.—The joint 850 east crosscut is now out a total distance of 550 feet, the face being in hard porphyry. The 1300 east crosscut is in 88 feet, and the face is in low-grade quartz.

Central District.

COMING TO THE FRONT.—*Silver State*, June 11: A. D. Wilcox, S. W. Ruse and County Clerk Dunn left this morning for Central district to look at the mines. The district is coming to the front, the Aurum and Locomotive being paying mines, and the Millionaire, owned by A. H. Ruse, it is believed, will shortly be on the paying list.

Prince Royal District.

PROSPECTING.—*Silver State*, June 11: In the early days of Humboldt, rich ore was found at the northern end of the Humboldt range, in what was called Prince Royal district. For some reason or other the mines were never developed to any great extent, and the district was abandoned many years ago. Now a Mr. Bousfield, one of the first prospectors in the district, has returned here and is looking for a lead which he discovered about 27 years ago. He thought he could go right straight to the lead, but so far he has been unable to find it.

COLORADO.

THE DUBUQUE TUNNEL.—*Aspen Times*, June 14: The ore streak recently opened in the Dubuque tunnel in Queen's gulch holds out satisfactorily. It varies in thickness from a few inches to two or three feet, and it has now been followed far enough to lead the management to believe that it is continuous. Ten or twelve tons of the ore has been taken out.

THE JUSTICE.—The flow of water in the Justice has so far decreased that Manager Crowe has been able to start up prospecting operations again in all parts of the property.

CHANGE OF MANAGEMENT.—A change of management has taken place on the Mollie Gibson, Frank Bulkeley having been succeeded by C. E. Palmer. The change was effected on Monday, and Mr. Palmer is now in full possession of the property.

THE BEST FRIEND.—The Best Friend mine in Tourtelotte park continues to take out sufficient ore to pay for development work, but no large body of mineral has yet been met with.

THE BUSHWACKER.—The Bushwacker mine is now producing from 30 to 40 tons of a good grade of ore per day. It is thought that the output for the month ending July 4 will reach \$75,000.

DAKOTA.

BOGUS JIM CREEK MINES.—*Deadwood Pioneer*, June 11: News of recent discoveries of gold and silver ores that had been made down on the eastern side of the Hills, along what is known as the Bogus Jim creek, reaching this office, a reporter was sent to that neighborhood where they were working, and found an outcrop of what we term dry ore about Deadwood, that we walked on for 1700 feet, and were shown the thickness of the ore in at least 15 places, and at no point less than one foot, and at the thickest places five to five and one-half feet of clean ore, rich in silicious matter to say the least, and probably some particles of precious metals. Of the last-mentioned substances none were discoverable to the free eye. Frank B. Yant, one of the prospectors, said that some fair assays had been gotten and a number of traces out of the ore, and so far had not seen a piece of porphyry, let alone a dyke of this rock, in the neighborhood, but if one or two of the last-named intrusives would be found cutting through the quartzite and ore, he would feel sure of finding regular and good pay. He further said that the lower strata of quartzite was but two miles wide and dipped northeasterly toward the foothills and could be traced one and one-half miles in the last-named direction. We found the ores sufficient in quantity and outward appearance. If it has the stuff in it the property is a fine one.

IDAHO.

PRICHARD CREEK.—*Wardner News*, June 11: Most encouraging news comes to us from the north side. The historic banks of Prichard creek seem destined to enjoy another boom equal, if not far greater than, that existing when the first cry of gold was heard there. Recent developments have brought to light the existence of carbonate ore there in large quantities, and the result of future operations in the region of the new find will be watched with much anxiety. The success of the recent discovery will create a new era in the prosperity of the country at large, and every well-wisher of Coeur d'Alene should rejoice accordingly. Silly prejudice should never exist in a mining camp, as the prosperity of one district helps the advancement of another, and nothing conduces to handicap their progress more than a foolish rivalry that has no ground for existence. While we rejoice with the good tidings from the north, we can safely say that the outlook for the South Fork was never so good as at present. The rise in the price of lead is most encouraging and the mines in all localities will in future be worked to much better advantage with the improvements that have been made and the new machinery that has been introduced. Closely identified with the vast mineral product of the country, and in fact every movement tending toward it, are the matchless mines surrounding Wardner.

MINNIE MOORE.—*Wood River Times*, June 11: Work has been discontinued in the Minnie Moore below the 600 level, for the present. Above that level work will be continued by leasers, but the company itself will not be directly responsible for any of the cost of working. Its sole concernment will be the receipt of royalties on the ore extracted. The property not only owes its owners nothing, Mr. Kinnear says, but has repaid all the investment and a satisfactory profit besides. That it has done so well, Mr. Kinnear says, demonstrates how good a mine it is. In addition to all the expensive mistakes made and the cost of the plant, which much exceeds \$100,000, it costs \$50, net, every day in the year, to keep the water out. This, without reckoning office expenses, pro rata interest on capital in-

vested, etc., which would bring the cost fully up to \$75 per day, but the Minnie has been draining the whole country. It is surrounded by the K-dict and other claims of the Miller Brothers, the Queen of the Hills and others; and none of them are doing anything worth mentioning in the way of drainage. Thus the whole expense falls upon the Minnie. If the owners of the surrounding claims ever agree to unite with the Minnie in paying the cost of pumping, the Minnie Moore Co. will be ready to resume operations throughout the mine, and by making a few connections can drain all its neighbors cheaply and effectually, but until then the Minnie will limit its field of operations to the upper levels.

MORE ORE IN THE WAR DANCE.—The second chute of ore was cut into last week in the lowest tunnel of the Emery and War Dance group, on Deer Creek. This chute was cut in the upper workings, and as it has been ascertained to continue in depth, it adds considerably to the value of the property. The ore was cut at a depth of 325 feet. As the lowest tunnel is driven into the hill it attains greater depth with every inch of advance, so that when two or three ore chutes exposed in the upper workings shall be cut it will be at a depth of 400 to 470 feet. This will give the owners a great height of backs and several years' prospecting and development work, before going any deeper.

PLACER POSSIBILITIES.—*Idaho City World*, June 10: The More Creek Bedrock Flume Co. has made a big puff and blow, created a big smoke with but little fire, and has now settled down to doing nothing. It appears that a number of the company want to be in on the dividends but not the assessments—to put in nothing—but be full partners when the dust comes out. That kind of a scheme will fail to work, except to work injury to the country. Bedrock flume has been talked and talked for over 20 years, and thus far all the talk has come to naught. Not a box of flume has ever been constructed. Numbers of companies have been organized, but through scheming, sea-sawing, pulling and hauling, dog-in-the-manger opposition, etc., the millions of money in the bed of More creek still slumbereth undisturbed, and may be gathered in by some future generation. Another enterprise was agitated for many years, but of late the interest in it has been slumbering. It is more in the nature of a theory to be demonstrated than anything else, and in it are magnificent possibilities. It is to sink through the sedimentary deposit—a formation termed by miners a "false bedrock." A formation of this kind has existed in but two or three sections outside of Boise Basin—the most noted being in Australia. By far the best pay there was found between the formation and the solid bedrock. What is underneath this "false bedrock" of the Basin is yet to be determined. A shaft was sunk in the bed of More creek a great many years ago, but after going down over 100 feet, operations had to be abandoned on account of the inferiority of the pumping machinery. Near the junction of Middle and North Boise rivers there is a formation like this of Boise Basin. Above it the ground was just fairly good. New parties got hold of the ground this season, went through the "false bedrock," which was only a few feet in thickness, and between that and the granite bedrock the gravel is immensely rich, running four bits and over to the pan. It looks as if a company could easily be organized in the Basin to sink a shaft and see what is below—between the "false bedrock" and the country rock—the granite. If 20 or 30 would form themselves into a company it would cost each but little, and they would not feel the loss, even if the experiment were a failure. When reminded of the other sections that have yielded so immensely below this same kind of formation, it affords a good foundation for faith in the theory that the best pay in the Basin is deeper down than explorations have yet been carried.

LOWER CALIFORNIA.

ALAMO NOTES.—*Lower Californian*, June 12: It is hinted that there is a gentleman in camp who proposes to put up a 40-room hotel as soon as he can find a suitable location, and arrange for bringing in his outfit on reasonable duties. The output from the mines is greater than ever before and all the mills in the camp are running night and day except the El Paso, and it is waiting for new dies which will be here in a few days. John Albright made a rich strike last week in the Montezuma. A half pound of dirt and rock produced \$5.30. John is happy. The ore in the A-bestos is running over \$40 per ton. The Encantada is a large producer and consequently Russell & Co. are furnishing plenty of mescal to their friends. The Scorpion mine was leased last week and is now one of the heavy producers again. Mr. Howard came up to camp last week to put men to work on the Butler property, but he found only two idle men in camp. He had to go to the Real for laborers, who are now in Alamo. The camp is in great need of good miners. The Newell brothers have made an unexpected strike on the Ulises claim. A 30-ton lot yielded \$65 per ton. Unfortunately the St. David mine has been overflown by water and is now lying idle waiting for machinery. It is reported that the pumping machinery for both the Indian and St. David mines is in San Diego. The final fittings for the hoisting works on the Telmaco arrived by the company's last freight team, and the machinery will soon be working. There was a cave-in on the Telmaco a week or so ago, but nobody was hurt. The Elsinore is being worked in good shape. It is being timbered, has a good force at work and is turning out as much gold as any mine in the camp. Quite extensive placers are being constantly worked in out-of-the-way places among the flats and canyons. The placer miners are the most cosmopolitan and picturesque folks in the whole country. Chinamen by the dozens leave their rude brush huts on the hillsides to toil in the trenches, Mexicans by the dozen with their broad sombreros and red flannel shirts, and Americans—a queer lot of them—all stick to the placers. Some of them make four or five dollars a day occasionally, but the work is hard and the results are uncertain.

UTAH.

ORE.—*Salt Lake Stock Exchange Journal*, June 14: Over a million pounds of Bullion-Bock ore was received in the city Tuesday and Wednesday. Value of the consignments, \$16,000. The Alliance

drain tunnel is now in a distance of 4200 feet, and it is the intention to push it 800 feet farther, when it is expected that a rich vein will be struck. The Centennial Eureka Co. have a large balance to their credit at the bank, and are shipping one car of high-grade ore daily. Sixty-five thousand and twenty pounds of Alliance ore was received in the city and sold yesterday. It assayed 34.05 per cent lead, 74 ounces silver and 72 ounces gold to the ton. The Glencoe has several hundred tons of shipping ore on the dump and a big body of the precious metal in sight. The stockholders are considering the feasibility of building a mill.

WASHINGTON.

LEDGE MATTER.—*Okanogan Outlook*, June 11: Negotiations are on foot for the transfer of valuable mining properties on Ruby hill. The new shaft on the Lady of the Lake is down about 25 feet and in a splendid body of ore. Dennis McDonald, superintendent of the Red Shirt mine in Methew county, came to town this week. The tunnel is now in about 100 feet. There are three men at work on the Modock, adjoining the Idaho mine on War Eagle hill. They have sunk a shaft 14 feet, showing up a good strong ledge. The Modock is owned by L. E. Murray, Alex. McPherson and Jack Waters. Geo. Plunder has four men at work on the Second Thought mine on Ruby hill. They have run a tunnel 83 feet since the first of April, and are now crosscutting the ledge at a depth of 60 feet below the surface. An offer of \$60,000 has recently been refused for this mine. This may seem a large sum, but when taken into consideration that its location is between the Fourth of July and First Thought, both of which are conceded to be mines of great value, the owners are perhaps justified in refusing what might be considered a big price for a prospect.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 10, 1890.

- 429,877.—TENSION DEVICE FOR BELTS—A. G. Anderson, Oakland, Cal.
429,841.—MUSICAL NOTATION—C. C. Kropp, S. F.
429,844.—PIPE—J. P. Culver, Los Angeles, Cal.
429,900.—STEAM-GENERATOR—L. E. Fish, Los Angeles, Cal.
429,616.—GRAIN SEPARATOR—W. L. Gilson, McMinville, Or.
429,723.—SHAFTING HANGER—M. D. Hemenway, S. F.
429,917.—HEADER-BRAKE—Hinchliff & Hall, Spangle, Wash.
429,857.—ORE-FEEDER—Loftus & Booth, S. F.
430,036.—CALENDAR—Y. Paez Alameda, Cal.
429,869.—CABLE RAILWAY SWITCH—H. Sawyer, S. F.
429,823.—AMALGAMATOR—C. W. Tremain, Portland, Or.
429,826.—AGING WINES—L. Wagoner, S. F.
430,049.—ORE-CRUSHER—G. W. Weller, Baker City, Or.
430,050.—WAGON-BRAKE—N. A. Wheeler, Alameda, Wash.
19,891.—DESIGN—L. N. Beauchemin, Tacoma, Wash.

The following brief list by telegraph for June 17, will appear more complete on receipt of mail advices: California.—William P. Young and C. D. Middlkauff, S. F., vapor solder; Charles Traflet, Tankeo, Johns, gold-saving device; Theodore A. Wheeler, assignor of half interest to W. F. Wright, San Jose, carriage axle nut; Thomas Williamson, Collierville, tread for wheels; John B. Solin, Fresno City, washing machine; D. Schuyler, San Diego, music-leaf turner; William T. Y. Schenck, S. F., fire-hydrant; Delia McGregory, Los Angeles, machine for making butter; John Mason, Petaluma, gate; Levitt A. Mucktoe, S. F., crib; Jacob G. Kenyon, Port Kenyon, vehicle axle; George Griscl and F. Servio, assignors of a third interest to J. D. Case, S. F., mitch-making machine; Lamont W. Estes, Sacramento, spike-making machine; Charles H. Ensign, Temescal, an I. P. B. Wright, Berkeley, packing for stuffing-boxes; John Wiesenhuber, assignee of the Electric Vapor Engine Co., S. F., single-acting explosive engine; same, double-acting explosive engine; same, cut-off for compound engines; George A. Cavalli, assignor of half interest to C. N. Kirkbride and R. H. Jary, San Mateo, key-hole guard; Cullen B. Bingham, Volcano, crumpling-mill; Mora M. Barrett and J. F. Daly, S. F., two patents for gas engines and one for gasoline engine.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR AGING WINES.—Luther Wagoner, S. F. No. 429,826. Dated June 10, 1890. This invention relates to the artificial aging of wines and distilled alcoholic liquors; and it consists in a means for gradually supplying a small quantity of air, which is caused to flow continuously and steadily into the liquor to be treated, and in a means for filtering said air before it is introduced into the liquor. Wines are at present aged by slow absorption of the oxygen of the air through the pores of the wood of which the cask is made, about 15 to 20 per cent, by volume, of air being required to age the wine in from four to five years. Should the air be introduced into the liquor ton rapidly or directly, the process may be endangered by giving the wine an undesirable flavor, and also by exciting a new fermentation either by the introduction of germs in the wine, or if the germs are already in the wine, in supplying oxygen in sufficient quantities to produce their growth. The object of this invention is

to introduce purified air into the cask in a slow and regular manner, and so gradually that the oxygen may only react upon the acids in the wine, and not be present in sufficient quantity to unduly permit the said reaction or to excite the latent germs if they be present.

PIPES.—John P. Coiver, Los Angeles. No. 429,844. Dated June 10, 1890. This invention relates to the class of pipes which are specially adapted for water, gas and drain pipes, and also for use as conduits for laying electric wires underground, and it especially relates to that class of pipes which are formed of a volute of sheet metal covered with and rolled up in asphaltum. The improved pipe consists of a volute of sheet metal covered with end rolled up in asphaltum, and its exterior bound with wire wrapped side by side several laps around at places desired, said laps being soldered together.

AUTOMATIC SWITCH FOR CABLE RAILWAYS.—Houghton Sawyer, S. F. No. 429,869. Dated June 10, 1890. This invention relates generally to the class of cable railways, and especially to those switch mechanisms which are designed to be operated automatically by the passing car. The invention consists in the novel construction and arrangement of the switch-operating levers. The general object of the invention is to effect an economy in the operation of the road by dispensing with the services of a switchman, effecting this result by a mechanism adapted to be operated automatically by the grip-shank of a passing car. The particular object is to provide a simple, effective, automatic switch mechanism of that class in which one or more levers are pivoted within the tube or tunnel of the railway, said levers being connected with the throw-rod of the switch and adapted to be operated by the passing grip.

ORE-FEEDER.—Edward O. Loftus and Edgar H. Booth, S. F. No. 429,857. Dated June 10, 1890. The invention relates to that class of ore-feeders in which the ore is delivered by a suitable hopper upon a rotating cylinder, by which it is discharged into the mortar of the battery, the motion of said cylinder being derived from and regulated by the drop of the stamps. The invention consists in the novel construction of the feed-cylinder or roller, and in the mechanism by which it is operated. The peripheral surface of the cylinder is corrugated. The peculiarity in the roller rests in the inclined or spiral direction of the corrugations. This apron or inclined corrugated surface is positive in its feed of wet or sticky ore. By having the corrugation inclined or spirally arranged, the ore is dropped out gradually by each depression as the cylinder reaches a certain point, and is continuously and evenly distributed.

CALENDAR.—Yndalecio Paez, Alameda. No. 430,036. Dated June 10, 1890. This invention relates to that class of calendars in which a number of independent disks or plates are mounted within a suitable casing or shell having a sight aperture, said disks or plates being adapted to have a rotary motion imparted to them, and having upon their faces characters giving the necessary information of a calendar, and the invention consists in a series of novel disks or plates and the mechanism for moving them, whereby their characters are successively and properly brought into line with the sight aperture. The object is to provide a simple and portable calendar adapted to be readily operated.

WAVE-FORCE PUMP.—George F. Day and Ernest H. Cole, S. F. No. 429,231. Dated June 3, 1890. This is a device which is called a wave-force pump, and it consists of an open-mouthed cone or chamber decreasing in area from the mouth toward the rear end and having its mouth presented to receive the waves, and in connection therewith of a conducting pipe with check valves. A permanent pier may be employed having one or a series of funnel-shaped chambers so placed that the force of the waves running rushing into the diminishing-chambers will produce such an acceleration of speed and momentum that it will force a body of water through pipes to a considerable height.

FRUIT PITTING MACHINE.—Chas. W. Elkins, Palermo, and Wm. O. Foreman and Stenton Freeman, Bidwell's Bar, Butte county. No. 429,209. Dated June 3, 1890. This is one of that class of fruit-pitting machines in which the fruit is caught between and out by opposing reciprocating knives, the cut fruit being discharged automatically by a swinging or tilting bed. The object is to provide a simple and effective machine for pitting fruit which does not require any manipulation of the fruit, the latter being fed to the knives automatically, out in halves and the pit and halved fruit discharged separately and automatically, the whole operation being performed by a single crank movement.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MECHANICAL PROGRESS

Improvements in Pipe Making Processes.

The manufacture of pipe for conveying water, gas, oil, steam, heated air, etc., has become an immense and constantly increasing industry, and has consequently engrossed a large share of the inventive genius of the mechanical world during the last few years. Two very novel and bold processes have been quite recently solved—one in Europe and the other in this country. The European (German) invention, known as "Mannesmann's Pipe Molding Process" was recently described in a lecture delivered before the Berlin section of the German Engineers' Association by Prof. Reuleaux. The lively interest excited in the invention was proved by the large number of persons present, among whom were many prominent Government officials. The new process, it was stated is of national importance, and is calculated to bring about

A Complete Revolution in Various Branches of Industry.

In the course of a few seconds a massive block of metal is transformed into a pipe by the compressive action of rollers working from without, no mandril to work inside being required. This sounds somewhat of a technical paradox, and although it has for years been carried out practically, it is a problem that permanently excites the highest scientific interest. The Mannesmann process is adapted to the most varied kinds of metals, even to the hardest steel. The pipes or tubes can be made large or small, thick or thin, both sides or one side open or closed, and hollow hearers can be formed with right-angled cross sections. No boring, seam, brazing or welding is required.

The Process.

When a cylindrical body of soft metal or of glowing iron or steel is pressed between two rollers revolving in the same direction, it, naturally, is moved in the opposite direction to that of the rollers, and is drawn as long as the pressure of the rollers continues to operate. Should the rollers be fixed in an oblique position should their axes not be parallel, but at an angle to the body, not only is a pressure then exercised, but also a lateral pushing action. In such a case, providing the power and speed of the mechanism is great enough, the cohesive resistance is overcome, and a rather remarkable, though quite natural, occurrence takes place. The outer parts of the bodies are driven forward, while the inner parts remain behind, or, to make use of an expression employed by Prof. Reuleaux, the metal block is flayed. It is assumed there is a resistance to the pushing action. This resistance may arise from the block being thicker than the space between the rollers, or from a mandril being pressed against the block, the latter then being driven round the former. In the absence of the resistance no tube is formed, but it is possible to form from a single piece a hollow body closed all round, without joint or seam—a problem which until recently was regarded as insoluble. It is only necessary that at the beginning and end of the block a piece should be thin enough to pass through the rollers without undergoing pressure. In that way perfectly closed tubes are formed, the inside of which is inaccessible. Such tubes have been cut open to ascertain how the inside looked. It was anticipated that a vacuum would exist, but erroneously. The hollow contains hydrogen gas, a slight volume of nitrogen and some inconsiderable mixtures of other gases. Hydrogen is thus contained in steel, and it develops in a vacuum or under the circumstances here given.

The Production of the Power

Necessary for the process is highly interesting. To accomplish a transformation of the character indicated in the space of about 30 seconds, machinery of thousands of horse-power is necessary. The force is, however, only required for 30 seconds. The required power is, so to speak, stored up in an enormous fly-wheel, the revolutions of which are performed with extraordinary rapidity. An ordinary fly-wheel would not do, because it would fly to pieces after having passed a certain moderate velocity. Messrs. Mannesmann therefore constructed a special fly-wheel, the circumferential surface of which is overlaid with cast-steel wire. This fly-wheel can be driven with such rapidity, and without risk, that a force of thousands of horse-power is produced. The process has been developed quietly and unostentatiously. The incomparable firmness of the tubes and pipes obtained by the peculiar spiral arrangement of the metal fiber, through which it is possible to roll several metals into one another, and the possibility of rolling the pipes in all conceivable forms, assures to the process a brilliant future. Among the articles to which the process can be applied may be mentioned pipes for gas, water and compressed air (it is possible to make the last named up to a pressure of 50 atmospheres), boiler tubes, heating pipes, copper telegraph wire with steel core, shafts, railway axles and sleepers, carriage and velocipede parts, iron girders, bridge and pontoon parts, material for shipbuilders, lances, gun-barrels, gun-cases, cannon hoses, grenades, and many other articles too numerous to mention; quite a number of the articles named have already been made and

are in use. The invention is a purely German one. The above is taken from *Kuhlow's* of a recent date.

The American Process.

The *Boston Herald* describes a process as follows, which, if not the same, is evidently quite similar to that attracting so much attention in Germany: Some three years ago a gentleman of this city began the study of improvement in the art of making tubes, and invented several machines and appliances for casting hollow ingots and tubular structures, and for rolling and hammering these, so as to lengthen and thin the walls, thereby forming seamless tubes of great symmetry and strength by methods that were entirely different from any before attempted. Several thousand dollars were expended in experiments and for building machinery, which, by great persistence and by the aid of skillful mechanics, terminated with successful and gratifying results.

Still Another Method

Which, with the one just described, has already been referred to in these columns, is also described in the *Herald* as follows: "But when these machines were perfected and finished, another cheaper and altogether more efficient method of forming tubes was conceived by the inventor, who, after thinking the matter over for a number of months, resolved on building other machinery and of making experiments in a hitherto unheard of and unthought of direction."

"The boldness of his plans may be somewhat appreciated when it is stated that they consisted of rolling a tube, directly from steel, iron, brass, or other metal, in a molten or fluid condition. The undertaking was ridiculed by all mechanics to whom the subject was broached, and was considered as wild a scheme as any that ever had been heard of. But the man gradually perfected and systematized his designs until drawings were made which were deemed satisfactory, although still somewhat crude in detail. The machines were built and fully tested, and it has been demonstrated that what was considered a downright impossibility is as simple and practicable in performance as the commonest of mechanical undertakings."

The Economy of These Methods

Is tremendous, inasmuch as it avoids and renders unnecessary the entire labor, machinery, heating, handling and waste of material belonging to and required in the manufacture of tubes and pipe by the ordinary methods, and when it is stated that one concern made and sold \$13,000,000 worth of tubes at a profit of \$1,250,000 last year, some idea of the importance and far-reaching results of these inventions may be realized. It is claimed that the tubes and pipes made by these methods will be superior in strength and finish to those made by any other known process, the manipulation of the metal being such as to avoid blow-holes or porosities which are found in steel-manufactured goods generally. They will also be symmetrical and smooth inside and outside, and can be used without boring for many purposes where a common tube would not answer. The inventor has still other methods of making compound tubes by casting and rolling one metal around another, fully as practicable and economical, applicable to very large diameters, and constituting with the others a series of inventions which for originality, scope and value have rarely been equaled. Machinery is now being built and the business will be established upon a working basis just as soon as all arrangements can be made.

BOILER MANUFACTURERS' MEETING.—The third meeting of the American Boiler Manufacturers' Association, which will convene in New York on Tuesday, July 1st, promises to be of great importance. The question which will attract most attention is that of forming a boiler manufacturers' insurance company. The committee appointed to consider the subject is a large and comprehensive one, every member of which is committed in favor of establishing the company. The Committee on Materials and Tests will make a further report at this meeting, which will relate to the proportional thickness of iron and steel to the diameter of the boilers. The Committee on Manholes and Manheads, in which there was a division last year, will complete its report, as will also the Committee on Safety Valves and Horse Power. The Committee on Uniformity in State Inspection laws will submit a form for a law governing the inspection of boilers, the adoption of which will be urged upon the different States. It has been arranged that any one who desires may take advantage of the one-third reduced rates by procuring the regular printed receipt of the railroad companies for the full fare paid when leaving for New York. Reduced hotel rates have also been arranged. While in New York the members of the association and their wives will be the guests of the merchants of that city, who have been instrumental in having the meeting held there.

GOVERNORS FOR MARINE ENGINES.—One of the results of the "City of Paris" accident has been the revival of interest in governors for marine engines, and it is to be hoped that this may lead to something definite. The duty which is a satisfactory marine governor must perform, is in many ways so much more difficult than that which occurs in stationary practice that it is not surprising that no practically satisfactory solution of the problem has yet been made, and in spite of the many promising attempts the field is yet open.

SCIENTIFIC PROGRESS.

THE ACIDS OF FRUITS.—George W. Johnson, in his *Chemistry of the World*, says, in describing the "vegetable food of the world": "The grateful acid of the rhubarb leaf arises from the malic acid and bin-oxalate of potash which it contains; the acidity of the lemon, orange and other species of the genus *Citrus* is caused by the abundance of citric acid which their juice contains; that of the cherry, plum, apple and pear, from the malic acid in their pulp; that of gooseberries and currants, black, red and white, from a mixture of malic and citric acids; that of the grape from a mixture of malic and tartaric acids; that of the mango from citric acid and a very fugitive essential oil; that of the tamarind from a mixture of citric, malic and tartaric acids; the flavor of asparagus from aspartic acid, found also in the root of the marshmallow, and that of the cucumber from a peculiar poisonous ingredient called fungin, which is found in all fungi, and is the cause of the cucumber being offensive to some stomachs. It will be observed that rhubarb is the only fruit which contains bin-oxalate of potash in conjunction with an acid. It is this ingredient which renders this fruit so wholesome at the early commencement of the summer, and this is one of the wise provisions of nature for supplying a blood-purifier at a time when it is likely to be most needed. Beet-root owes its nutritious quality to about nine per cent of sugar which it contains, and its flavor to a peculiar substance containing nitrogen mixed with pectic acid. The carrot owes its fattening powers also to the sugar, and its flavor to a peculiar fatty oil; the horseradish derives its flavor and blistering power from a volatile acid oil. The Jerusalem artichoke contains 14½ per cent of sugar and three per cent of inulin (a variety of starch), besides gum and a peculiar substance to which its flavor is owing, and lastly, garlic and the rest of the onion family, derive their peculiar odor from a yellowish, volatile, acid oil; but they are nutritious from containing nearly half their weight of gummy and glutinous substances not yet clearly defined."

IMPROVED PHONOGRAPHS.—Two of the principal objections that have been urged against the phonograph and other talking instruments with which the public have become tolerably familiar are the metallic quality of the voice reproduced and the necessity of using hearing tubes, arising from the poor volume of the reproduction. Lieut. Bettini claims that in his micrographophone, as he calls it, these difficulties have now been overcome by the employment of several independent diaphragms instead of the one diaphragm of the usual instrument. It is said that the reproduction of the human voice is singularly clear and free from any harshness or metallic sound. By the use of a non-metallic trumpet the tones are still further softened. In reproducing music the notes of different pitch come out with a singular distinctness, and what is a crucial test, the timbre of the voice is admirably preserved. The characteristics of the record are relative loudness and absolute distinctness. Even a whisper is whispered back from the diaphragm very clearly. Another novel improvement in the phonograph is one which has for its primary feature the transmission of sound by the vibration of glass. From a glass diaphragm extend a number of glass tubes of various sizes communicating with an ordinary wire. Very clear and distinct utterance has been found to result on trials over a line three miles long.

TRANSMUTATION OF COTTON SEED.—Was there ever, says the *Bankers' Monthly*, such a history as that of the cotton-seed? For 70 years despised as a nuisance and burned or dumped as garbage, then discovered to be the very food for which the soil was hungering, and reluctantly admitted to the rank of utilities; shortly afterward found to be nutritious food for beasts as well as for soil, and thereupon treated with something like respect; once admitted to the circle of farm industries, it was found to hold 35 gallons of pure oil to the ton, worth in its crude state \$14 to the ton, or \$40,000,000 for the whole crop of seed. But then a system was devised for refining the oil up to a value of \$1 a gallon, and the frugal Italians placed a cask of it at the roots of every olive tree, and then defied the Borean breath of the Alps, and then experience showed that the ton of cotton-seed was a better fertilizer and better for stock when robbed of its 35 gallons of oil than before, and that the hulls of the seed made the best of fuel for feeding the oil-mill engine, and that the ashes of the hulls scooped from the engine's draught had the highest commercial value as potash, and that the "refuse" of the whole made the best and purest soap stock to carry to the toilet the perfumes of L'Infin and Colgate. Verily, here the touch of the wand of science has been little short of magical.

HOW DIFFERENTLY WE LOOK AT THINGS.—You and I see everything, to some extent, differently. You see things from the standpoint of your previously acquired ideas; I from mine. Strictly, no two persons can see the same thing in the same way, for it can never happen that two persons have precisely the same groups of ideas relating to any subject. These depend on our past experience, on our education, on the beliefs of our times, on our various sects or

parties, on our pet theories, our interests, and our desires. Here is a simple illustration: Suppose an artist and an engineer standing side by side overlooking a tract of country. What they perceive is the same; what they apperceive is wholly different. To the engineer, the country presents itself as a possible line for a railroad, with here advantageous grades, and there economic bridges. Before the artist is spread out a landscape, with light and shade and harmony of colors. Suppose, again, a plot of level ground in the suburbs of a city. A college student, riding by, apperceives it as a possible ball-ground; a young girl, as a tennis court; a speculator, as an addition for town lots; an undertaker, perhaps, as a possible site for a cemetery.—*Popular Science Monthly.*

SUCCESS A MATTER OF CHARACTER.—It is a great mistake to suppose that the best work of the world is done by people of great strength and great opportunities. It is unquestionably an advantage to have both these things, but neither of them, quoting from the *Manufacturer and Builder*, is a necessity to the man who has the spirit and the pluck to achieve great results. Some of the greatest work of our time has been done by men of physical feebleness. No man has left a more distinct impression of himself on this generation than Charles Darwin, and there have been few men who have had to struggle against such prostrating ill health. Darwin was rarely able to work long at a time. He accomplished his great work by having a single aim, and putting every ounce of his force and every hour of his time into the task which he had set before him. He never scattered his energy, he never wasted an hour, and by steadily keeping at it, in spite of continual ill health and of long intervals of semi-invalidism, he did a great work, and has left the impression upon the world of a man of extraordinary energy and working capacity. Success is rarely a matter of accident; always a matter of character. The reason why so many men fail is that so few men are willing to pay the price of self-denial and hard work which success exacts.

POWER OF WATER.—The power of water to dissolve lead in leaden pipes is at present attracting much attention. In Great Britain the lead pipes for conveying water-supplies are apparently becoming a serious source of lead-poisoning. A new source of the power of water to dissolve lead is likely to be ascertained. The *British Medical Journal* says: "The fact that in recent years the water supplied to many towns has for some reason come to possess the power of dissolving lead to an extent sufficient to produce widespread prevalence of lead-poisoning among consumers is a serious matter. Dr. Klrker found that the power of certain samples of water to dissolve lead was directly proportional to the number of microorganisms which they respectively contained. Upon this hypothesis, the acid reaction which renders water capable of dissolving lead may be due, not to sulphuric acid derived from a pyritous soil, but to the chemical products of bacteria." If this, as well as other theories regarding the action of water in dissolving lead, be established as true, some substitute for leaden water-pipes will be in order.

HOW FAR WE CAN SEE.—There has been a great discussion going on in Europe concerning the distance at which large objects on the earth's surface are visible. Emil Metzger mentions that he once saw Keizerspicks, in Samatra, when separated from it by a distance of 110 English miles; he also says that on very favorable occasions he has made out to see Gny Merapi, in Java, when 180 miles intervened. E. Hill, the civil engineer, says that he has seen Mont Blanc from Piz Muran, near Disentis, a distance of almost 120 miles. J. Starkie Gardner states that Mont Blanc is visible from Piz Landgard, though distant about three degrees. Waymper, the explorer, says that when he was in Greenland he could plainly see a mountain peak from which he was separated by 150 miles. The whole range of the Swiss Alps have been looked upon by J. Hipolyte while 200 miles away; Sir W. Jones affirms that the Himalayas have appeared to his view from the great distance of 224 miles!

SCALES THAT WILL WEIGH A HAIR.—The fine gold weighing scales made in Philadelphia and intended for the mint at New Orleans, a few years ago, are marvels of mechanical invention and expert workmanship. The larger of the two pairs has a capacity of 10,000 ounces troy, or about 636 pounds avoirdupois, and when loaded to its full weighing capacity will indicate the variation of the one-thousandth of an ounce. The other and smaller pair is intended for lighter work. All its bearings are of the finest agate which have been ground with remarkable precision. This instrument is believed to be the most delicate in the world. It will give the precise weight of a human hair, and is susceptible to the slightest atmospheric changes.

MAN IS THE ONLY ANIMAL THAT HAS TEETH.—In horses, canines and molars—of an equal height. Man, the ape and nearly all ruminants, have 32 teeth. The hog, however, is better off than this, and has 44. So have the opossum and mole. The river dolphin of South America lays far beyond this, however, having no less than 222 teeth. Teeth are not part of the skeleton, but belong to the appendages, like skin and hair.

GOOD HEALTH.

The Rational Use of Medicine.

Nothing illustrates more clearly the modern progress of medicine than the disappearance of the bulky and disagreeable boluses, powders, draughts and mixtures which the physicians of former times administered to their patients. In many cases with but little effect except to put an additional burden upon an already wearied and overloaded stomach. The homeopathic physicians have at least shown that excessive medication is unnecessary, and that no medication at all will result in an equal number of cures in a great majority of cases, while the present tendency of all schools of medicine is to limit their prescriptions, both in number and quantity, and place more reliance upon hygienic and sanitary precautions, combined with watchful and experienced nursing and care. The philosophy of prescribing what are popularly known as "medicines" is really a very simple matter. It is a well-known fact that certain substances, when taken into the system, produce certain physiological effects. Thus, opium and its alkaloids produce sleep, Ipecac causes vomiting, quinine is found to have a remarkable power of controlling intermittent fever, and so on through the list. There is really no difference between a medicine and a poison, except in the violence of its action; and, in fact some of the most powerful poisons are found to be valuable medicinal agents when administered in minute doses. The scientific physician, therefore, will not attempt to "cure" a disease by any specific remedy, but will endeavor to fully understand the cause and nature of the abnormal physiological action which is taking place in the system of his patient. As the action of medicines is very variable in different persons, and under different conditions of the disease, the necessity of skillful medical attendance, and the folly of depending upon the various widely-advertised patent medicines is evident.—*Popular Science News.*

Elevator Sickness.

The elevator in modern big buildings has only one drawback—the sickness it causes when the car is suddenly stopped. To people of a delicate constitution this sickness is often such a serious matter that to them the elevator is a dangerous blessing. This sickness, says a contemporary, can be avoided by observing simple physical laws. Elevator sickness is caused by the same law that throws a person to the ground when he gets off a moving car in the wrong way. The stoppage of the elevator car brings a dizziness to the head and sometimes a nausea at the stomach. The internal organs seem to want to rise into the throat. All this comes from the fact that all parts of the body are not stopped at the same moment of time. The feet being next to the car floor stop with the car, while other portions of the body continue moving. If the body as a whole can be arrested at the same time with the feet there will be no sickness. This can be done by placing the head and shoulders against the car frame. Then there will be no sickness. It is a sure preventive.

THE HUMAN BREATH A POISON.—At a recent meeting of the Académie des Sciences, Prof. Brown-Séquard referred to some experiments he had conducted with a view to determine what, if any, were the toxic effects of the human breath. In condensing the watery vapor coming from the human lungs, he obtained a poisonous liquid capable of producing immediate death. This poison is an alkaloid (organic), and not a microbe, or series of microbes, as might have been imagined. He injected this liquid under the skin of a rabbit, and the effect was speedily mortal. The animal died without convulsions; the heart and large vessels were engorged with reddish blood, contrary to what is observed after ordinary death, when the quantity of blood is moderate and of a dark color. In conclusion, this eminent physiologist said that it was fully proved that respired air contained a volatile toxic principle far more dangerous than the carbonic acid, which was also one of its constituents, and that the human breath, as well as that of animals, contained a highly poisonous agent.—*Medical Press.*

WOMEN DOCTORS.—Sir William Gull, the eminent English physician who died recently, when asked his opinion on women doctors, expressed himself as follows: "Personally" he said, smiling, "I should only be too pleased to be called in consultation with one of my fair confederates, but such has not often been my fate." Then, more seriously, he added: "I think one ought always to help women study medicine in every possible way. I have the greatest respect for the ladies now practicing in London, and feel sure that they must fill far more satisfactorily than the average medical man could pretend to do, certain posts. A young child at first would always rather be attended and operated upon by a woman than by a man, though they get wonderfully soon accustomed to 'the doctor'."

A CELEBRATED GERMAN REMEDY FOR BURNS consists of 15 ounces of the best white glue broken into small pieces in two pints of water and allowed to become soft; then dissolve it by means of a water bath and add two ounces of

glycerine and six drachms of carbolic acid; continue the heat until thoroughly dissolved. On cooling, this hardens into an elastic mass covered with a shining, parchment-like skin, and may be kept for any length of time.

USEFUL INFORMATION.

The Seal.

A recent issue of the *Alta* recorded a curious peculiarity in the habits of seals which may possibly lead to important results in hunting for these valuable and interesting ocean inhabitants. The bell buoy which is kept over Noonday Rock to notify mariners of the exact position of that dangerous submerged rock had drifted from its moorings and gone to sea. The rock is located near the Farallone islands, in about 18 feet of water. Much difficulty was anticipated in finding the rock, which had to be done by sounding. When the sounding party reached its vicinity, it was decided to test the truth of an idea that many sealing men entertain. It is necessary to explain said idea. It is well known that there are innumerable seals and sealions along this coast. Old sailors say that seals frequent and flock around submerged rocks as well as rocks that appear above the water, and that if they can be alarmed by a loud, sudden noise or a concussion in the water, they will rise to the surface in a body from around a submerged rock, and that one can rest assured that the middle of the rock is below the center of the group of sea animals.

"Let us give that idea a practical test. It will do no harm," said Captain Davies, addressing Inspector Captain Perry.

"All right; pull the rope," was the reply. Captain Davies grasped the cord to the steamer's whistle and gave it a dozen short, sharp jerks. The noise was deafening, and, of course, produced a concussion on the waves. All hands watched the surface of the surrounding water. Several seconds passed, when suddenly, off the port side, innumerable seals were seen to come to the surface. There were hundreds of the animals, and they stretched themselves as far out of the water as possible to find what had disturbed their repose beneath the waves. The steamer was several hundred yards distant from the group, which covered half an acre or more of space. The experiment was a success, but the Madrone was so far away that the inspector, not wishing to put the buoy in at random, decided to try it again. So, taking his bearings, he steamed away, so that the seals might settle down on the rock again. Later in the day the steamer returned to about the place where the seals arose before, and again the heavy-voiced whistle was blown, and once more the sea animals came to the surface near the vessel. It was a peculiar sight. The sea for a long distance around was actually alive with the curious mammals. Soundings were made near the middle of the group, and the rock found. In a short time the buoy was put overboard and anchored over the rock, and once more a deep-toned horn warns the mariner of the presence of danger beneath the sea.

WHAT IS RATTAN?—Every one knows the pretty, light and graceful chairs and other articles of furniture made from rattan, but every one does not know that the extremely tough and flexible wood called rattan is that of a climbing palm-tree. This curious climber (which is more of a vine than a tree) is one of the singular characteristics of forest growth in the Celebes and other Malayan countries. Starting with a trunk as thick as a man's leg, it winds through the forest, now wrapping a tall tree in its folds, like some gigantic snake, and then descending again to earth and trailing along in snake-like curves until it can find some other stately tree to fasten and climb upon in its pursuit of light and air. The forest is so thick and jungle-like that it seems impossible to follow the course of any one of these serpentine climbers; but there is little doubt that at the last the successful aspirant, which stooped and orange so long below, will be found shooting up like a flagstaff a dozen feet or more above the tree which has helped its rise. A use of the rattan, which is unknown to those who have not seen it in its native forest, is a water-carrier. The thirsty traveler has at all times a tumbling of cool, refreshing water at his command by cutting off six or eight feet of the rattan and putting one of the severed ends to his mouth, or holding it over a dish to catch the water.

THEY ARE NOT SIMILAR.—Many people think that gutta percha and india-rubber are the same or very similar gums. This, however, is a mistake. India-rubber is the solidified sap of a South American tree. It is of a soft, gummy nature; not tenacious, but very elastic; is easily decomposed by oily substances, and does not stand acids well. Gutta-percha, which is only found in the East Indies, is obtained from the gutta tree. It is a brownish gum, which solidifies by exposure to the air.

SILK IMITATIONS.—We recently made some reference to a process for producing artificial silk. In discussing the latest development in the line of silk imitation, an English contemporary says: "Celluloid 'silk' is a cleverly fabricated tissue, which ought to be repressed by common consent, or, if necessary,

by parliamentary prohibition. Nothing so useful to dishonest dealers, and so dangerously inflammable, has hitherto been invented in the way of clothing. It is certainly cheap and handsome, and is therefore more tempting to the thoughtless or the defrauded who may be induced to buy as 'silk' a material which a spark would inflame, and which would burn with the fierceness of a rag steeped in petroleum. It may be in the future possible to lessen this inflammability, but the small sample referred to went off like a flash, and we may assume it was as fire-proof as can at the present time be made."

SHOP NOTES.

Shop Suggestions.

We clip the following "suggestions" from the *Boston Journal of Commerce*:

It has recently been ascertained that wood can be glued together so firmly that the joint will be as strong as the wood itself. Iron can be treated in the same manner, only it takes several days for it to set. There should be a sulphuric solution that would cut right in and get a hold at once and unite the parts as readily as electric welding. [For the formula by which this cement is made, see item in mechanical column of the present issue.]

A mechanic has been at work for a long time in making a pinion for a large gear that will run without rattling the machinery in pieces, and claims to have got his best results with green hide, wound in edgewise with sheet iron spirally, and bound together with rivets. A gear being noisy is not the only hindrance in putting up machinery. Belts are not only cheaper, and can be set up in less time, but manage to do their driving without being so positive in their action. Their ability to slip is a great safeguard in many establishments.

A crank on gearing, having the correct forms of gear teeth uppermost in his mind, was called upon at one time to explain his theory before an audience of engineers and mechanics. After taking up nearly his allotted time in explaining that the form of gear teeth should be such that the line of action will pass through the pitch point, and that every draughtsman should be careful and get an outline that will hold the active train in the right direction, some one of his hearers inquired how it was possible to lay out a gear tooth that would act otherwise. It is a principle in mechanics that if gear teeth keep in contact while the wheels are in motion the line of action must come where the pitch circles touch each other, and yet there is a case where a man of learning was trying to have a mechanic do that which he could not help doing if he would.

It is much easier to explain matters after they have taken place than to reason out what will take place beforehand. A belt man was called upon to explain why a belt should creep two per cent when there was a heavy load upon it. Thinking that the creep must have been a positive slip, he entertained his hearers for about half an hour with an explanation that all could understand, and was then informed that the creep was a negative one, creeping just opposite from what would take place with a slip.

Expansion of metals works some queer freaks which do not quite agree with reasoning. Just call on any one to explain why railroad rails are curved downward when they are rolled out, and they will show at once that it is to make them come out straight when they get cold, and proceed to give the reasons for it, which is far more reasonable than the facts of the case will bear them out in. Iron can be upset while hot by the shrinkage of some of the parts that cool first, and produce a result that was not reckoned on. Like the foundryman with his core bar, had they increased in length, he would have understood it, but the trouble was they grew shorter, and there was the mystery.

THE MEN WHO STAY.—Young mechanics make a very egregious mistake, says the *Builders' Gazette*, when they begin to think that they do too much for their employers when they work a few moments overtime to complete a small task they are performing, just at the time the whistle blows to quit work. More young men have been kept from receiving an advance in their wages from this than from any other known cause. Employers watch the movements of young men very closely, and the least little thing oftentimes places them in an unfavorable light before their employers. It is the young man who studies the interests of his employer, and is not afraid to give him a few moments that gets the rapid advancement. He is the young man selected when there are any favors to be granted. I can tell in 20 minutes in any workshop the young man who is most likely to succeed in his trade. He is the last to leave his work and is always prompt in beginning it. The fellow who drops their work at the moment the whistle blows, are always the ones that the employer is ready to discharge when business gets a little slack.

CHANGING EMPLOYEES.—Don't keep continually discharging your employees and hiring others in the search for better men. Those you already have are probably all right, if properly developed; and a man's value to you ought to grow in proportion to his length of service. If you don't efficiently remunerate faithful, intelligent service, you will never get good men, or, at least, you won't keep them.

ELECTRICITY.

Working Railroads by Electricity.

At the Cincinnati meeting of the American Society of Mechanical Engineers, Mr. W. E. Hall read a paper on the working of railroads by electricity. He held that with electric motors it would not be necessary to have track tanks and water stand-pipes distributed closely throughout the line, and time and expense would be saved. It would not be necessary to carry the dead weight of tender and its load. The experience with the centralization of power, where large hydraulic, pneumatic or electric plants are in operation, is that a greater amount can be supplied than is necessary to develop at the station—'hat is, where there is much division 50 to 60 horse-power plant can take and supply satisfactorily about 100-horse power. The reason for this is that it never occurs that all the power is used simultaneously. Multiplication of parts increases the number of pieces to wear and consequent repair, as well as the chances of failure from breakage. In the discussion that followed, one of the members exhibited an estimate showing that the cost of establishing an electric railroad could not be less than \$219,356 for the power alone. H. O. Spalding held that the next step in that direction will be the adoption of high potential currents along the track and low potential motors run by induced currents. This is successful in electric lighting, and may be used in transportation. The entire absence of reciprocating parts is a most important feature of the electric motor. Another point is that the higher the speed the greater the economy, as the usual 16 to 1 gearing is reduced. Further, the adoption of electric motors would give an opportunity for the utilization of the water-powers of the country.

EFFECT OF ELECTRIC LIGHT ON PLANTS.—A beautiful illustration of the effect of electric light was recently given by Dr. Siemens before the Royal Society of England by placing a pot of huddling tulips in the full brightness of the electric light in the meeting-room, and in about 40 minutes the buds had expanded into full bloom. Dr. Siemens told that he had planted a number of quick-growing seeds, such as mustards, carrots, melons, etc., and having divided the pots into four groups, had one group kept entirely in the dark, one exposed to the influence of the electric light only, one to the influence of daylight only, and one to daylight and electric light in succession. He applied the electric light each evening from 5 o'clock to 11 o'clock and left the plants in darkness for the remainder of the night. According to his observations, the plants kept entirely in the dark soon died; those exposed to the electric light only, or to the daylight only, thrived about equally, and those exposed to both day and electric light thrived far better than either.

ELECTRICITY IN THE HOME.—Prof. R. H. Thurston, in a recent article, gives a graphic description of what electricity will do in the near future. He says it will break up the present factory system and enable the home worker once more to compete on living terms with great aggregations of capital in unscrupulous hands. Great steam engines will undoubtedly become generally the sources of power in large cities, and will send out the electric wire in every corner of the town, helping the sewing woman at her machine, the weaver at his pattern loom, the mechanic at his engine lathe, giving every house the mechanical aids needed in the kitchen, the laundry, the elevator, and at the same time giving light, and possibly heat, in liberal quantity and intensity.

DRUGS ADMINISTERED BY ELECTRICITY.—Recent experiments have demonstrated that small doses of certain drugs can be made to pass through the skin between the poles of a galvanic current. Dr. Cagney reports having used iodide of potassium in this way for the cure of labyrinthine deafness and in lead palsy. The method is best adapted for the treatment of diseases of the skin itself, or tumors immediately beneath, and of mucous membranes. It offers the advantage of conveying a useful but not readily tolerated drug—probably in a state of maximum activity—directly to the part where needed, while many cases may be benefited at the same time by the stimulating action of the galvanic current.

Edison, when in Paris, laid great stress upon the fact that it was dangerous to be sending, side by side with gas conduits through antediluvian Paris, electrical currents by wires charged with high-tension currents, and predicted that explosions would be the result. Many explosions from this cause are now occurring in Paris, and the newspapers of that city are reverting to Edison's warning.

MORE WEIRD THAN POETIC.—Pryotechnic effects in table decoration are rampant. Electric wires are run through the stems of tulips, white lilies and jonquils; a bunch of them planted in an espartaco give the red, yellow, green and brown fruit the glow of enchantment, and when the white, bright light streams from a plaque of nita the sensation is rather more weird than poetic.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hauling a Big Redwood Log to the Mill; Electric Light and Power Plant Running Eight Pelton Wheels with Capacity of 1400 Horse-Power; 411. Mounts Dana and Gibbs; Mono Volcanoe; Red or Sardine Lake, B'ood Canyon, 419.

EDITORIALS.—A Light and Power Plant, 411. Passing Events; Free Coinage of Silver; Another Cruiser to be Built Here; The Molders' Strike; Academy of Sciences; Mining Bureau Museum; Forest Tree Distribution, 418. In the Sierra; Redwood Timber, 419.

CORRESPONDENCE.—Mines and Mills of Shasta County; Gold in the Cascades; The Mines of Amador County; The Hart & Fleming Mine; The Gold Belt of Northern California, 412.

MISCELLANEOUS.—Water on the Pacific Coast, 413.

MECHANICAL PROGRESS.—Improvements in Pipe Making Processes; Boiler Manufacturers' Meeting; Governors for Marine Engines, 416.

SCIENTIFIC PROGRESS.—The Acids of Fruits; Improved Photography; Transmutation of Cotton-Seed; How Differently We Look at Things; Success a Matter of Character; Power of Water; How Far Can We See; Scales That Will Weigh a Hair; Miscellaneous, 416.

GOOD HEALTH.—The Rational Use of Medicine; Elevator Sickness; The Human Breath a Poison; Woman Doctors; German Remedy for Burns, 417.

USEFUL INFORMATION.—The Seal; What Is Radium; They Are Not Alike; Silk Imitations, 417.

SHOP NOTES.—Shop Suggestions; The Men Who Stay; Changing Employees, 417.

ELECTRICITY.—Working Railroads by Electricity; Effect of Electric Light on Plants; Electricity in the Home; Drugs Administered by Electricity; Miscellaneous, 417.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 414-415.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 422.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 422.

Passing Events.

Work has been commenced on the new smelting works at Spokane Falls, Washington. The plant will consist of two water-jacket blast furnaces, with blowers, roasting furnaces, etc. The smelter will carry a large stock of ore on hand, and will be of great advantage to all outlying districts, especially the Cœur d'Alene region.

Only one of the cruisers was awarded to the Union Iron Works of this city, though it was at first supposed that they would get two. However, the building of this one vessel means the expenditure here among mechanics of \$1,795,000.

The molders' strike has not yet ended, although the union has offered a conference with a view to compromise the issues. The foundrymen, however, refuse to have any conference, seeing no reason for a meeting in view of the fact that they have employed other men in the places of the strikers.

There is an abundance of water in all the streams this season for milling purposes, and this will continue until the rainy season, owing to the great quantity of snow stored in the mountains.

The water in the Carson river is now at such a stage that all the mills are being run to their full capacity. As the nights are still cold in the mountains, it is expected that the present volume of water in the river will be so decreased that there will be room between banks for any freshet that may result from the next warm spell.

Free Coinage of Silver.

The action of the United States Senate in passing a bill providing for the free coinage of silver, shows the independence of that body, and also that party whip had no control when a large majority of the citizens of this country demanded any favored measure. There is not a State Grange but at its last annual meeting spoke unqualifiedly in favor of the free coinage of silver. Labor unions have done the same, while business men throughout the West and South and in several of the Eastern States have taken the same grounds. The most formidable opposition to free coinage has come from Wall-street gold-bugs, who apparently are controlled by the incentive for high interest, and with lessened money, more profitable speculative corners. This element is also backed by English capitalists. Henry Claws very pertinently said lately that "not long since 4 1/2 pence per ounce was the market value of silver in London, and it would not probably be much more than that now had the present agitation of the silver question not been brought up in Congress. The interest of the great merchants in London whose business is with the East, always favors a low price for silver bullion, and their efforts have been to depress the price. London has now lost the power of dictation to the silver market, and this country, which is entitled to it, has assumed it. If the present silver bill passes, the power of dictation will remain here, and London will adopt and follow our figures."

The Senate bill has gone back to the House as a substitute for that of the latter. At this writing it is difficult to form any decided opinion as to what the latter body will do with the bill, but it looks as if a conference will be held and a bill agreed upon; yet those in position to know affirm that the lower house will accept the free coinage bill of the Senate, and if President Harrison vetoes it, it will be passed over his head. With this a law, steps will be taken to draw European governments into favoring bimetallism, as was recently outlined in a speech by Hon. Francis G. Newlands, to whom credit is largely due for the success of free coinage in the Senate.

Another Cruiser to be Built Here.

While the \$100-ton cruiser was awarded to Wm. T. Cramp & Son of Philadelphia, the contract for the Cruiser No. 6, of 5500 tons, the largest ever built on the Pacific Coast, was given to the Union Iron Works of this city at a price of \$1,795,000. Prominent foundrymen aver that the molders' strike will have practically no bearing on the construction of the new cruiser, as the men now in the shops are perfectly competent to do all that is required.

It is a matter of great regret that the Navy Department saw fit to accept the plans of Cramp & Son for the \$100-ton vessel. On the plans submitted by the Department, the Union Iron Works had the lowest bid. On the separate plans submitted by the respective firms, however, that of the Philadelphia one was lower than that of our California shipyard. It was therefore decided to give the work to Cramp & Son for the larger vessel, while the 5500 ton ship comes to us. On the \$100-ton armored cruiser, the Union Iron Works' bid was \$3,100,000 and the Cramps' bid was \$50,000 higher. The Cramps put in a bid of \$2,985,000 if their own instead of the Department's plans were used, and the Union Iron Works offered to build on their plans for \$3,000,000, or \$15,000 more than the Cramps.

There has been some indignation expressed that the lowest bid on the Department's own plans was not accepted, instead of letting the Cramps get the vessel on their own plans, and this has been looked upon by many as savoring more or less of "politics." However, California has not very much to complain of at present in the matter of building Government vessels, as one has recently been launched, one is ready to launch and another is being started. The last award gives us the largest vessel ever built here.

An explosion in the coal mine on Hill's farm, Fayette Co., Penn., on the 16th, entombed 30 miners. The disaster is the worst ever known in the Connelleville region. Rescuing parties are at work, but there is little hope of getting any of the men out alive.

The Molders' Strike.

Some statements having been made in dispatches from Washington to the effect that the prevailing strike in this city was likely to interfere with the awarding of contracts for building Government cruisers, the foundrymen here telegraphed to the Secretary of the Navy that their shops would be at the disposal of the Union Iron Works for castings, and that work would not be delayed. In answer a dispatch was received from the Secretary of the Navy, who said that while he regretted the strike, his action would not be influenced by it. Meantime the Molders' Union sent a communication to the Foundrymen's Association suggesting a conference to adjust differences. To this the following reply was sent:

SAN FRANCISCO, June 16, 1890.

To Iron Molders' Union, No. 164 San Francisco—GENTLEMEN: In answer to your communication of the 14th inst., our association begs to state that the members of your union left our employ on March 3d without notice, and that we have employed others to take their places who are satisfactory to us; and as we have not taken any action to prevent your members from working in our shops with all the just privileges of American citizens, we therefore do not know of anything to adjust, and for that reason see no occasion for a meeting.

We join you in the hope that the cruisers will be secured for this coast, and feel satisfied that the work can be completed here in a manner to reflect credit on this city. Respectfully yours, etc., ENGINEERS AND IRON FOUNDERS' ASSOCIATION OF CALIFORNIA.

By R. S. MOORE Secretary.

This reply virtually not only declines a conference, but means that the foundrymen positively decline to have relations with the union as a body, but will accept individuals in their shops should they choose to apply for work.

The issue between the foundrymen and molders is now clearly defined and understood. The foundrymen are willing to take the men back as individuals, but they must work with any others employed, whether union men or not, and no union rules will be tolerated. They will abide by the ultimatum of March 10th, as published in the PRESS. The foundrymen contend that if they accede to the strikers' demands, they must close their shops. While the shops are not working full-handed, they have men enough for ordinary work, and others are coming. Thirteen more molders arrived this week and were put at work in the foundries.

Notwithstanding the labor troubles, one of the proposed cruisers was awarded to the Union Iron Works and she will be built here.

On Thursday a suit was filed in the County Clerk's office entitled the Union Iron Works against the Iron Molders' Union, No. 164. The plaintiff seeks to recover \$10,000 to compensate the corporation for damages caused by the union enticing a number of workmen away from the plaintiff's employment.

It is alleged in the complaint that Thomas Fitch, Thomas Evans, Mat Dole, Leonard Mager and John O'Neill were mechanics skilled in the science of iron-molding, and were in the employment of the Union Iron Works on June 11, 1890, and were so employed for about two months prior to that date. On the 11th of June the defendant, "intending to injure the plaintiff and to deprive the corporation of its employees, went to each of them and enticed them to leave the service of the plaintiff."

Forest Tree Distribution.

The State of California has received from Mr. Abbot Kinney of Lamanda Park a donation of many thousand young forest trees reared at that gentleman's expense. In making this presentation he has selected the State Board of Forestry as the proper channel for the direction of them to the best uses. Such of these trees as are not required to perfect their own plantations will be distributed, during the coming season, to such applicants as will conform to the board's request to furnish the customary reports as to locality planted, growth made, conditions observed, etc.

In selecting the State Board as the medium for the dissemination of these trees, Mr. Kinney was doubtless influenced by the knowledge that the intelligent direction and tireless efforts of the chairman of the board, Hon. Walter S. Moore, to foster and promote the cause of forest planting, would be fully exercised to insure such disposition of this magnificent gift as would result in far-reaching benefit to the people of the whole State. The secretary of the board is Sands W. Forman, 35 Flood building, S. F., and the forester is W. S. Lyon

of Los Angeles. We presume applications addressed to either of these officers will go properly on record for the coming winter's distribution.

Academy of Sciences.

At the meeting of the California Academy of Sciences on Monday last, Dr. Carrington Bolton of the New York Lyceum of Natural History delivered a lecture on "Sonorous Sand," a sand which is found in various parts of the world. He had specimens of sand in a bag, which, when pushed together, gave forth a sound. Dr. Bolton has traveled extensively, and has made this subject a special study. He had with him sands from Arabia, the Hawaiian Islands and other localities.

Prof. Carl Lumbaltz, of the Royal Academy of Sciences, Christiania, Norway, delivered a lecture on "Explorations in Northeastern Australia," which was illustrated with stereoscopic views. Prof. Lumbaltz was sent out from Sweden to study the fauna and civilization of Australia, and his lecture was closely listened to. He began by saying that many people had only the most vague idea of the extent of that country, and he informed his hearers that it was nearly as large as the United States, leaving out Alaska. He said it was easy to exist in Australia, and all manner of civilization could be found there. He described it as the wonderland of the scientist. His travels extended into Queensland, and he illustrated his remarks with views of the scenery, natives and their weapons, animals, etc. Of the native Australian he said that the latest theory advanced was that there was a kinship between the African and Australian negroes, and he mentioned some of the points of similarity between them. He stated that there was no rain in Queensland, frequently for eight or ten months in the year. He told of the low state of civilization there, and said most of the vegetables grown were poisonous, and that nearly all needed preparation before using. He said the natives in the interior where he was, ate poisonous snakes and reptiles, and in some instances practiced cannibalism, but did not like white human flesh because it was too saltish. His lecture was attentively listened to, and the views which accompanied his remarks were quite interesting.

Mining Bureau Museum.

The following are among the recent additions to the collection of the California State Mining Bureau:

Native antimony with stibiconite, Kern Co., Cal.; A. Banc.
Cube of granite (one foot) dressed and polished, from the quarry of the Rocky Point Granite Co., Exeter, Tulare Co., Cal.; Messrs. Griffith, Owens & Hughes.
Bementite, New Jersey; barite-calcite and chondrite, England from J. Z. Davis.
Old-style rocker for gold-washing, Mariposa, Cal.; D. Lawson.
Granite, Mt. Tamalpais, Marin Co., Cal.
Aztec or toltec, heads of baked clay, Miss F. Gates.
Gold quartz (rich in free gold), new locality, Eureka mine, Pine valley, San Diego, Cal.; Mr. Noble.
Crystallized stibnite, Hollister, San Benito Co., Cal.
Three rich gold-quartz specimens from the Idaho mine, Grass Valley—two of them from the rich quartz recently struck 1700 feet below the surface; Edward Coleman.
Silver ore rich in native silver, Venturas mine, Durango, Mexico; W. F. Campbell.
Fine specimens cuprite and azurite; J. Z. Davis.
Twenty-one specimens rare minerals (imported), Eastern States and Europe.
Asbestos from Corsica; R. H. Jones.

MECHANICS' INSTITUTE FAIR.—Secretary J. H. Culver of the Mechanics' Institute says that many applications for space are being received and many inquiries made regarding the coming fair. The board at the last meeting made up the premium list, and a large number of medals and cash premiums will be awarded; it was now in the hands of the printer and will be ready for general distribution soon. The art gallery is to be made an especial attraction, and a large number of pictures not heretofore shown to the public will be placed on exhibition.

COAL MINERS AT WELLINGTON.—R. Dansmnir & Sons have positively refused to meet any committee from the Council of Federated Trades to arrange for a settlement of the troubles existing between the firm and the coal miners at the Wellington coal mines. It is reported that the Dansmnir firm will begin evicting the families of the miners from their homes at the Wellington coal mines on July 12th.

In the High Sierras.

NUMBER II.

Through Bloody Canyon to Mono Lake.

Before the adventurous trip to Mount Lyell (as described in last week's PRESS), the party of students passed through the Sierras to Lake Mono, and returned to Soda Springs. This occupied three days. A conspicuous trail was discovered after they left the camp at the base of Mt. Dana, which led the party to Mono Pass, the entrance to Bloody canyon, which is noted for its steepness and its dangerous trail, its picturesque rock scenery and its floral beauty. In the descent through the canyon to the east the slope is extremely steep, the total length being two miles, within which distance the trail descends at least 2000 feet in vertical height. The trail leads down to the base of the mountain over an old battered-down stairway. Here the trail is rough and treacherous, as the name of the canyon is intended to suggest. At one place the trail turns sharply to the right, and sweeping down a narrow gorge partially filled with loose fragments of slate, suddenly presents an impressive scene. Here they are almost entirely hemmed in by cliffs. A deep, unnatural-looking lake rests serenely in a solid rock basin. Beyond, egress seems impossible, so steep do the walls appear and so narrow the outlet. This is certainly the lake which was gouged out by the glacier that in former ages filled the canyon. Yonder is the cliff over which the ice fell. There can be no doubt about it. This is "Sardine" lake; here is the place where a mule once slipped and fell into the water, and with his load of sardines, was lost. The party was greatly relieved to find the exit less terrible than it had seemed.

"All along the trail, especially near the summit, the rock scenery was brightened by the multitude of flowers which blossomed in

mass of the Sierras had at one time been lifted up as one huge block which had been tilted away a little from us, so as to leave a long, gentle slope on the western and a short, steep one on the eastern side. The picture given on Mt. Dana and Mt. Gibbs, taken from near here, will illustrate to some extent the steepness of the slope." [The photo-facsimiles given in this and the previous article were made from negatives taken by the young assistants of the expedition, and are not quite as

created them was exerted in frequent earthquakes, which, it is supposed, helped to elevate the Sierras. Even now the energy is not entirely dissipated, as is shown by the hot springs which exist on the islands of Lake Mono and the frequent earthquakes experienced in the Basin region.

"We made our camp on Rush creek, and went down to the lake shore just as the sun was setting behind Mt. Dana, and the evening shadows added their weird effect to the dead lake.

MOUNTS DANA AND GIBBS.

we were unable to solve. Here we were in a volcanic region where earthquakes are common. Can we attribute the above phenomenon to a local subsidence of the shore-line or to an elevation of the lake-bed, causing the water to overflow the shore, or is it caused by the gradually increasing humidity of the basin region, tending to enlarge the lake to its former size?"

Redwood Timber.

In the forests of Sonoma, Mendocino and Humboldt counties, in this State, the trees out for lumber average much larger in size than any in the world. These redwoods are not the "show" big trees of California which are in Calaveras, Mariposa, Fresno and Santa Cruz counties, and are of a different variety. But the big redwoods of the northwest coast of the State are utilized for lumber, being cut wherever met in the forest at such points as logging camps are located. Trees eight and ten feet in diameter are not at all uncommon, and many are found from 14 to 16 feet. The very "larges", when felled, are sawed into logs, and the logs split by powder before being hauled to the mill, such sections being too unwieldy to handle readily.

A photo facsimile on page 411 shows a log loaded on the cars for the Navarro mill, Mendocino county, and will give an idea of the size of some of the timber cut in the woods of that region. Some logs are floated down the river during the high-water season, but a railroad has been built 12 or 15 miles into the timber, and on this logs are brought to the mill near the ocean at all times. The engraving is made direct from a photographic negative, so that no exaggeration occurs. The figures in the picture will give an opportunity for comparison of size of log and men.

THE MECHANICS' INSTITUTE.—At a meeting of the Board of Trustees of the Mechanics' In-

MONO VOLCANOES.

RED OR SARDINE LAKE, BLOODY CANYON.

profusion. There were musk plants and wild onions, scarlet and azure pentstemons, gillias white, Gentians purple, and yellow columbines of the most delicate texture and exquisite beauty. About one-half the way down we found wild currants and gooseberries. Here also the first trees began to appear.

"After we reach Moraine lake, about 2 1/2 miles below the summit, our mountaineering is done. There are no foothills beyond worth mentioning. Our course now lies over a burning, sandy plain, as much unlike the verdant meadow at Soda Springs—which is nearly the same elevation—as one can imagine. Coarse, prickly plants of the poppy family, stumpy wild plum bushes and sagebrush characterize the flora.

"The road leading to the lake, about six miles distant, was pointed out. It turned away immediately from the border of the desert and led out into the alkali plain. Looking back toward the Sierras, we were impressed with the general precipitous character of the slopes facing us. It appeared very much as if the

clear as might be the case with negatives taken under more advantageous circumstances.—EDS. PRESS.]

"As we proceeded toward the lake, the heat became more intense and the alkaline and salty dust more provocative of thirst. Vast cycles of change here present themselves. Long ages ago in the history of man, but very recently in geological times, there existed a fresh-water lake 300 or 400 square miles in area, into which the glaciers of the eastern side of the Sierras doubtless discharged huge icebergs.

"Later the volcanoes appeared, and the glaciers gradually retreated, leaving their skeleton arms extending for miles out into the plain. The lake began to shrink in size, and this process was marked by successive beach lines, which are conspicuous features of the landscape to-day. The accompanying cut shows one of the highest, which appears sharply marked against the sides of the volcanoes, over 600 feet above the present level of the lake. After awhile the volcanoes ceased to pour forth their smoke and lava, but the energy which

By long evaporation its water has become so alkaline and salty that nothing can live in it, except the larvae of a certain fly, which swarm in myriads along the shore. These, together with the teeming multitudes of fully developed flies which swarm on the muddy and salt-crusted banks, give rise to a disagreeable suggestion of decay rather than of growth, a feeling which is not relieved by the numerous shrubs just off shore, which have been surrounded by the alkaline water, and now lift their bleached and motionless skeletons as a silent symbol of death.

"There are flocks of birds of various kinds attracted by the abundance of flies. But what is most striking, perhaps, is the great abundance of the common sea-gull, which, always considered by us as a scavenger for man, and always associated with him, seems greatly out of place here, where the human face is seen but seldom.

"The presence of the dead bushes off shore presents a question of considerable geological importance, which, owing to our limited time,

stitute, the Committee on Rules and Awards presented a final revision of the premium list, which was ordered to be printed at once for distribution. The various committees were instructed to begin active preparations for getting the pavilion in order, and to push forward all the preliminary work for the exhibition in September. The board authorized Secretary Culver to also act as its general agent during the illness of William Cameron, who is quite sick.

SCHOOL OF INDUSTRY.—The State Prison Directors have, after a general discussion, agreed to purchase the site for the Preston School of Industry at Ione, Amador county, from the Ione Iron and Coal Co., and the water-right from B. and M. Isaacs, provided the deeds and bonds offered are considered satisfactory by the attorney.

The Mint officials are preparing for the annual cleanup and refuse to take any more crude bullion at present. After the 21st of the month fine bullion will also be refused.

Manufacture commenced at
Albany, New York.

1876.

Introduced by us on Pacific
Coast.

1889.

Cheap imitations having had
time to show that they are the
most expensive in the end, the
Sales of the Genuine Albany
Compound are Larger than
ever before.

England, Belgium,

France,

And other Foreign Countries
are now Large Consumers.We are also Sole Agents for
the

Albany Cylinder Oils,

Albany Spindle Oils, Etc.

FOR SALE ONLY BY

TATUM & BOWEN,

Sole Agents for the Pacific Coast,

Dealers in Improved Woodworking Machinery,

Sawmill Machinery, Engines, Boilers, Ironworking Machinery, Supplies, Etc.

Sole Agents for Hoe Chisel-Tooth Saw, Gardner Governor, Schultz
Leather Belting, Etc.

34 AND 36 FREMONT STREET, SAN FRANCISCO.

85 FRONT STREET, PORTLAND, OR.

Day's Improved Quartz Stamp Mill.

This Mill is designed for the Prospector, the Assayer and
Sampler of Gold and Silver-bearing rock. It is a perfect mill,
built entirely of metals, and of the best mechanical construction;
will amalgamate perfectly in the battery or on plates.
It strikes a sharp, heavy blow with a light stamp. Shipping
weight, 225 lbs. Price \$75. Address

JAMES DAY.

ATLAS IRON WORKS, Cor. Napa and Louisiana
Streets, Potrero, SAN FRANCISCO, CAL.N. B.—CHAPPELL, Butte Co., Cal., Nov. 10, 1889.—Mr. Jas.
Day, Chico: The little mill is a daisy; it comes up to all ex-
pectations; it works perfect in all respects. Yours truly,
WALKER, REESE & CO.

"RED FLAX CORD"

SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for water and steam. Packs
with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality hav-
ing been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will
now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold
by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and
224 Market Street, San Francisco, Cal.A. T. DEWEY
W. B. EWER.
GEO. H. STRONG.

Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies
the information accumulated through long and careful practice before the Office, and the frequent examination of
patents already granted, for the purpose of determining the patentability of inventions brought before us, enable
us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE ORIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and
high heads are utilized, and are guaranteed to give more power with less water than
any other wheel made. Being placed on horizontal shaft, the power is transmitted
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in
capacity to suit any particular case.
Further information can be obtained of this form of construction, as well as the
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,
by applying to the manufacturers.

BOISE CITY, CAPITAL OF IDAHO.

Metropolis and by provision of Constitution Permanent
Capital. Unusual opportunities for investment and
business. Capital needed. Mortgages at 10 per cent.
Saw mills, brick kilns, woolen mills, iron works wanted.
Unlimited water power. Beat anxiety, schools, churches,
Perfect climate. Stock growers' paradise. Free Govern-
ment Land. Or at grain, fruit and vegetable
country. Field crops net \$25 per acre. Idaho, "Gem of
the Mountains," will soon be a State. Third in precious
minerals. Output last year, \$17,000,000.00. Cattle
business with pleasure and visit us. Excursion rates.

IDAHO, "GEM OF THE MOUNTAINS."

Idaho's rapid increase in late years in mineral
production is due to the scientific methods formed by capital
and long experience. There is large opportunity
throughout the mining districts of Idaho to develop
mines with almost the certainty of large profits. Gold
bullion is cashed at the Government assay office in Boise
City. At the same time no mining field offers more
attractive inducements to the hardy miner whose capital
lies chiefly in his experience and in his pick. Full and
complete information concerning Idaho mines will be
mailed on application.

IRRIGATING CANALS.

Another great opportunity for capital in Idaho is in
large irrigation enterprises. Projects are on foot to re-
claim several hundred thousand acres, but there is room
for many other such projects. Idaho has abundance of
water, and the profits of irrigation are large and sure.
For further details address

BOARD OF TRADE.

Boise City, Idaho.

J. POOLEY.

Mr. WILLIAM MONTGOMERY of the American Exchange Hotel, 319 Saosome street, on leaving for the East handed over the entire management of the hotel to his brother Charles. This is a sufficient guarantee that this hotel will continue to be popular and that the standard maintained in the past will not be lowered.

. | 1844.

A New Book on Assaying.

THE BEST IN THE ENGLISH LANGUAGE.
IT LEADS ALL OTHERS!

Now Ready.

THE ASSAYERS' MANUAL.

An Abridged Treatise on the Domestic Examination of Ores and Furnace and other Artificial Products. By Bruno Keri, Prof. in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by Wm. T. Brannet, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by E. Lynwood Garrison, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Ingenieure, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo cloth, price \$3.00. By mail, free of postage, to any address in the world.

Abstract of Contents: GENERAL DIVISION.—I Mechanical Manipulations; II Chemical Operations; III Assay Furnaces; IV Assay Vessels; V Balance and Weights; VI Tools and Implements; VII Assay Reagents. SPECIAL DIVISION.—I Lead; II Copper; III Silver; IV Gold; V Platinum; VI Nickel; VII Cobalt; VIII Zinc; IX Cadmium; X Tin; XI Bismuth; XII Mercury; XIII Antimony; XIV Arsenic; XV Uranium; XVI Tungsten; XVII Chromium; XVIII Manganese; XIX Sulphur; XX Fuel; Appendix; Index.

A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our new and revised Catalogue of Practical and Scientific Books, 86 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

Cables for Cable Roads.

One of the items of expense in cable roads is the cost of the cables or ropes, and this has become more apparent since so many curves and crossings have been constructed on the increase of cable roads.

The wear on the steel cables is almost entirely

have to be made by a number of comparatively small sheaves placed horizontally—in the line of the curve—when the car cannot be carried around by gravitation. When it can be carried around by gravitation, then a single large rope sheave is employed. The rope is released from the grip and picked up on the other side of the curve. In all cases, however, the wear on the

from a point of observation below the conduit and where he can see the rope and grip, can realize the enormous amount of power and heat expended in starting the car, from the stream of fire developed by the momentary slipping of the cable through the grip.

This rapid development of heat means destruction to the cable in two ways; one, by

without such a high quality of steel, the needed tensile strength could not be obtained. The steel wires in the cables of these cable roads are required to have a tensile strength of about 200,000 pounds per square inch of surface.

The question of increasing the durability of such cables has received the attention of Mr. A.

ly due to the contact of the cables with the grips and sheaves, and to the sharp bends over sheaves of small diameter. The employment of sheaves of small diameter should be avoided wherever it is possible, but in some cases, of crossing another cable line, this cannot be entirely prevented. The cables belonging to the younger cable railway company have to pass below that of the senior company, and this is done by dipping under the conduits, the cable being depressed by rope sheaves.

Again, in passing around corners, the turns

cable is almost entirely from abrasion, and the projecting part of the wire becomes worn down to a flattened surface. The wear for the first few days on the exposed wires of a new cable is very rapid, and the wires soon present a section such as is shown in Fig. 6 of the accompanying illustrations, when originally it was perfectly round as in Fig. 5. The strength of the wire is thus reduced in proportion.

Any one who has taken the trouble to watch the effect of starting a loaded car on an incline,

the grinding off of the projecting portions of the individual wires by abrasion, as already explained, and the other by the heat transmitted to the highly carbonized steel wire, to be rapidly cooled off in the cold atmosphere or dampness, and thus raised to a hard temper which destroys the toughness of the wire, causing it to break like glass.

It may be said, why use steel wire subject to such facility for taking temper, and why not use a much milder steel or a quality of iron like Swedish or Norway? The answer is that

S. Hallidie, the inventor of the cable system, who has for some years past carried on some practical experiments to obtain better results and with considerable degree of success.

In this he has had the co-operation of the California Wire Works and the cable roads of San Francisco, and the record of the life of such cables has shown durability increased from 15 to 30 per cent.

These cables are usually made up of six strands, each having nineteen wires—a center wire covered by six and the six again covered by 12, making 19 wires in each strand—and are technically called "flexible wire ropes," and it is essential that they should be sufficiently flexible to bend over the numerous sheaves and galleys on the line of the road. The outer wires being in contact with the sheaves and the grip, and oftentimes rubbing over the ground, are soon abraded and a large proportion of the wire worn off.

In order to protect the wires against the effect of such abrasion, Mr. Hallidie has, after considerable experimenting, so far modified the form of the cables as to reduce the wear on the wires and the liability of becoming hardened and tempered to a very considerable extent.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

Mines Around Glendale, Montana.

EDITORS PRESS:—The outlook for mining developments about this vicinity in the immediate future seems bright. The Hecla mines are working the usual amount of men. Although but one stack is running in the smelter here at present, the other—now shut down for repairs—will be in operation soon. The roaster is also undergoing repairs and will be started up immediately.

The Wake Up Jim mine, between Greenwood and Hecla, is apparently going to become a valuable property. At one time it was the property of the Hecla Co., but not being patented, it was forfeited through a misunderstanding and is now the property of Messrs. Bradford & Conway. It is under a bond and lease to other parties, who have struck a fine body of ore above water level. This ore is being taken out and shipped to Anaconda for treatment, the second class ore paying all running expense of the mine, leaving all the first-class net profit.

Vipond district is now creating great interest, especially the Quartz Hill portion of the district.

Helena and Butte capital is anxiously seeking investment there and middlemen have bonded and leased a great many prospects.

The impetus to the stir was given by two strong companies taking hold as if they meant to stay. First is the Lone Pine Co., operating the Lone Pine mine, for which we learn they paid \$60,000. After staking a winze about 90 feet below the old workings, their brightest hopes were more than realized by the development of fully nine feet of a much higher grade ore than had ever been found in the mine.

The walls of the vein are apparently still diverging, so the width it may attain may yet be more surprising.

The vein was very flat on top and lay like a blanket along the northwest side of the gulch. But as it approaches the middle of the gulch, it inclines more rapidly to the vertical.

The company has stopped taking out ore, as there is plenty on the dump to run the mill for some time yet. They have put three shafts on the new shaft immediately across the gulch to tap the vein below the winze. On June 7th, the shaft was down 54 feet. It is a fine 4x9 shaft, well and nicely timbered, and partitioned for ore and manway. The building is partly finished and the hoist being moved in.

Mr. Thompson, the foreman, is doing all in his power to rush the work along, and expects to tap the vein at a depth of 100 feet, when a full force of men will be put in the mine to extract ore.

The second mine of importance at present is the Patengale, owned by the Jay-Hawk Co., English capitalists, who, we are informed, bought the property last fall for \$25,000, and have put up a fine steam hoist. They use air compressors for Barleigh drills. The shaft is down 155 feet, and levels run. The vein is eight feet wide, and the quality of the ore improving rapidly in the bottom. They are working 13 miners and several hands, and putting up a fine stamp-mill at Dawy's Flat.

The Handy Andy mine is a small, rich vein near the Patengale, owned by Mrs. Liggett of Butte, and is under a lease to the Panky Brothers from the same place. These gentlemen are shipping the highest grade ore in camp. The mine is working six men and developments this spring are very successful.

Nicholls & Cable, real estate agents of Butte, have secured a bond and lease on many claims, among which are the following: Claims owned by J. Kilkenney et al. on which they are working two men. Also the Aerolite, owned by William H. Brown, bonded for \$5000; lease expires in three months. Two miners are at work developing this immense ledge. The footwall only has been found, and the vein is supposed to be 75 feet wide. The ore is very spotted on top, but one boulder of float, broken up and shipped, yielded $3\frac{1}{2}$ tons that milled $4\frac{1}{2}$ ounces of silver per ton. Some ore in the shaft has assayed 53 ounces. Should this ledge improve with depth as others in the district have done, we may look for a million-dollar bonanza. It is situated about two miles southerly from Quartz Hill. Within a few hundred yards northwesterly from it Mr. Brown owns another vein, smaller but much richer as far as developed. A shaft is sunk 60 feet and levels run 50 feet each way, easterly and westerly. The vein shows from two to four feet of rich ore. The first class milled 83 ounces silver, and second class 25 ounces. Over 100 tons of ore have been milled from this mine, the name of which is Tuxedo.

About $1\frac{1}{2}$ miles southerly from Mr. Brown's property are the well-known Vipond bonanzas, lying idle at present, but as Mr. Vipond has returned from the East, it is hoped he will take the developing fever now raging in the district and do something.

Mr. Joseph Sturm has two fine prospects near the above, on which he has worked hard all winter, and his labors have been crowned with success. The improvements in his ledges have surprised himself as well as others, and we are informed that the property which he offered for a few hundred dollars only about a year ago he now asks \$20,000 for.

Three mines about Quartz Hill, owned by the Gelbreth Bros., are bonded for \$15,000, but

work thereon is continued by the present owners.

The Banner mine is leased to Mr. Green, who is working three men.

The Faithful is an immense ledge about one-half mile westerly from the Vipond mines, which several parties have examined with a view to lease or purchase, but as yet we believe it is idle.

In addition to the above, many other prospects have been more or less developed during the past winter and spring, and with very encouraging results.

We do not look for a boom, as many do, in Vipond district during the present season, but should the prospects now being developed prove as good as those already partly opened up, we will undoubtedly have a first-rate camp within two years hence. B.

The Mines of Amador County.

NUMBER II.

[By Our Own Correspondent.]

Knight's Iron Works, Sutter Creek.

The water-wheels and mining machinery of these works go into every mining section and the works are well known in consequence. At present Mr. Knight is building a combination hydraulic engine and pump for the Kennedy mine. This machine is to be placed at the 1250 level. It will take its water-power from the mine's water at the 500-foot level, which will be conducted down to the engine by pipe.

The water that supplies the engine is exhausted into the pump column and flows to the 1050 level with the mine's water pumped, and there discharges into the 1050 level and flows to the No. 3 shaft, where it is hoisted by bucket. In time a hydraulic pump will be put at this shaft. This pump economizes space and uses the mine's water for power. Mr. Knight has put in two of his hydraulic pumps at the Plumas Enreka mine, Plumas county, one at the Wildman, Sutter Creek, and one at the Marguerite, Sierra City, in addition to this combined pump and engine for the Kennedy.

Amador Reduction Works.

Voorhes & Barney are the proprietors of these works which are located midway between Sutter Creek and Amador City. These works have been in operation for 17 years, and are the most complete, if not the largest, in the State. They are also the owners of the Patengale Reduction Works at Drytown (Amador county). The Amador works have a capacity of three tons a day. Ores are bought on the assay value, and an average of 92 per cent of assay value given, and \$20 a ton charged for treatment. The concentrates from the ores of the mines in the county carry an average value of \$100 a ton.

Amador City.

The South Spring Hill, J. R. Tregloan superintendent, is opened to a depth of 800 feet. Two shafts have been put down—one for working and the other as an air-shaft. The vein is ten feet in width of \$10 ore, with two per cent sulphurets. The mill has 30 stamps, 10 Frue and 2 Triumph concentrators. Fifty electric lights of 20 candle power each illuminate the works. The able superintendent wisely suggests that all mines should use the electric light, as the water or power which runs the rock-breakers during the day is not used during the night. This water can be utilized to first run the dynamos and then dropped into the batteries, thus furnishing the electric light at no expense other than the cost of the plant.

The Talisman, J. R. Tregloan superintendent, has a shaft down 900 feet and is now being reopened and put in working order. A ten-stamp mill will be erected this season. Crushings at various times give an average value of \$5 a ton.

The Keystone.

This mine is opened to a depth of 1600 feet on the vein. The vein has run from 1 to 100 feet in width. At this time they are drifting on the 1600-foot level, with every indication of striking a good body of ore. This mine supplied 20 stamps with ore for 18 years and 40 stamps 28 years, crushing $2\frac{1}{2}$ tons to the stamp of ore averaging \$15 a ton. The sulphurets average $1\frac{1}{2}$ per cent and run from \$100 to \$200 a ton. The ores are concentrated by Hendy concentrators and the tailings run over Morris canvas tables.

A Mine-Timber Framer.

At the Keystone, Mr. Isaac Lopley, the company's machinist, has a machine for framing mining timbers. This machine frames all four sides of the timber at one operation without moving the timber, and cuts to any desired length or angle, doing the work of 12 men with that of one.

The timber is fastened on to a movable platform. With a hand-lever the operator brings the timber forward; another lever sets the cutter in motion. This is placed on a movable mandrel mounted on a carriage. The cutter, revolving like a planer, passes up one side of the timber, then across, down on the opposite side and back underneath the timber. The cutter is readily raised or lowered and the carriage moved backward or forward, as desired. This is a valuable machine where large numbers of timbers have to be framed. The Keystone Co. use 11 of Mr. Lopley's water-wheels on mine and mill. One 60 and one 62-inch circular saw are run direct, the water-wheel

being placed on one end of the shaft and the saw on the other, giving the power direct without the use of pulleys or belts.

Bunker Hill.

This mine is operated by a Philadelphia company, Mr. John Myers superintendent. Their north shaft is down 800 feet; the south shaft 400 feet. The vein runs from 2 to 20 feet in width. The ore carries 3 per cent of sulphurets, running \$60 to the ton. These concentrates are worked in the company's chlorination plant, which is of two-ton capacity. The revolving barrel process is used. They find this method more economical and to save a larger per cent than the usual chlorination process. The superintendent kindly remarks that whoever tries the process must be sure of the quality of the chloride of lime employed if they would be successful. The mill has 40 stamps, crushing $2\frac{1}{2}$ tons to stamp, and 16 Frue concentrators.

The Gover.

The north shaft on this mine is down 1000 feet; the south 700. At this time they are working the 300, 500 and 600 foot levels. The vein runs from 6 to 20 feet of ore averaging \$15 a ton. The ore carries 2 per cent of sulphurets. The mill is of 20 stamps with Woodbury concentrators. J. Call is superintendent.

Plymouth.

The Cosmopolitan, W. S. Weymouth superintendent, is $1\frac{1}{2}$ miles south of Plymouth. The shaft is down 750 feet on an eight-foot vein of ore carrying $1\frac{1}{2}$ per cent of sulphurets. The mill is equipped with 30 stamps, two Triumph and twelve Frue concentrators. The owners are Bostonians.

Reavee.

This property is one mile south of Plymouth. The mine is worked by tunnel and open cut. The vein is 25 feet in width on the surface. The ore is quarried out, shot down into the cars in the tunnel and run into the 20 stamp mill. The vein matter averages \$1 a ton in value, and is mined and milled for 75 cents a ton. K. T. Crocker is superintendent.

New London.

H. Reese is superintendent of this property. It joins the Pacific on the south. The company sank 1340 feet on the vein and drifted 600 feet before erecting a mill. That takes "sand and soap," and is an example worthy of imitation. If we had more of it and less expensive and extensive plants, built on prospects, the mining industry would not be looked upon as risky. The vein runs from 3 to 15 feet in width. The company has just erected a fine 40-stamp mill with 16 Frues.

Plymouth Con.

W. T. Jones of the old Eureka of Sutter creek is superintendent. The company is working the Pacific. The old workings from the third to the seventh level all caved in consequence of the fire. The shaft remained intact. These five, six and seven levels were drained out, but the great amount of water in the past winter caused them to refill. The levels will be allowed to settle before they are reopened and worked.

The mine is now being worked on the 300-foot level. The vein is open to a depth of 1620 feet. There still remains intact 700 feet on the south end of the Pacific and 1200 feet additional adjoining on the Indiana. The mine is in a new body of ore south. It is looking well, but is not sufficiently developed to prove its character. Should it prove good, the mill—80 stamps—will begin running. At present 40 stamps are running. The company mine and mill for \$2.75 a ton.

With the exception of the mines northeast of Jackson, all of the mines that I have written of are on the mother lode. The mother lode with its great length, strength and gold value, is too well known to need any description.

Gravel Mines.

The Telegraph Hill mine is six miles east of Amador City. The mine is an old river channel that extends from this point to Volcano. The gravel is under an old lava ridge. A tunnel 500 feet long has been driven to cut the channel and will be in this season. Very heavy gold and large quantities of it were taken from this property when worked by the hydraulic process. Messrs. Keeney & Stetzer of Amador are the owners.

Water Supply.

The mines and mills of Amador Co. are all run by water-power. The water is furnished principally by the Blue Lakes Water Co. The company takes their water from the North Fork of the Mokelumne. The ditch takes out 2500 inches and delivers 2000. The system covers all of the lower part of the county. Water for mining purposes is sold at 20 cents an inch; for irrigation, 12 cents for 10 hours. Recently a company have incorporated to furnish San Francisco with water from the Blue lakes. This, the Blue Lakes Water Co., will form a part of that system. The mountain portion of the county is covered by the McLaughlin ditch, formerly known as the Jackson.

While the Amador Ice Works cannot be called a part of mining operations, the fact that this company, with their three-ton in 24 hours output with a Stevens machine, are furnishing the citizens of the county with ice for $1\frac{1}{2}$ cents a pound, is cooling to think of by those contemplating a summer visit to Amador. In conclusion, I would add that the mining men of Amador are gentlemen, and the visitor can depend upon a cordial reception and kind treatment. E. H. SCHAEFFLE.

The Gold Belt of Northern California.

Ancient River Channels and Gravel Deposits.

NUMBER III.

[Written for the MINING AND SCIENTIFIC PRESS by JAMES F. TALLEY, Shady Run, Placer Co.]

On the Middle Fork Divide.

In regard to the gravel deposits, I will follow up the line of illustration of this theory on the Middle Fork divide.

The invariable operation of natural laws throughout the universe must be admitted, and under the operation of those laws, causes that produce certain effects in one locality would, under like conditions, produce the same effects in other localities, however remote. This is as true in regard to all of those gravel deposits that have been formed since the commencement of the volcanic period as in any other operation of nature.

The process by which those gravel deposits were formed was apparently very simple and natural, and commenced in the gold belt, after the Pliocene river channels were dammed up at some particular point, and continued to the end of the epoch. Where a dam is formed in a large river of sufficient strength and with material that will resist the pressure and force of the water above, it is obvious the accumulating waters must have an outlet.

To illustrate the principle, we will suppose an extensive volcano burst out at the head of the North Fork of American river; the lava would as naturally flow down that river as the water. In the course of time the lava would form a complete dam, from crest to crest, at Cape Horn. On the south, Indian and Shirt-Tail canyons, and on the north, Bear river, heading high up on the ridges, would be free of lava. The badrock country around this lava dam being less resistant would give way at some low sag on the south, toward Indian canyon.

Any person with a vivid imagination who has witnessed a cloudburst or an immense reservoir break may have a remote miniature idea of the process and "catch on."

Where this break is supposed to occur, there is a grade from the ridge to the bed of Indian canyon, of 1000 feet within a mile. As the break becomes deeper, the propelling force is increased and great masses of big boulders and heavy material are carried down by the steep grade and deposited on the bottom where there is less grade, until the erosion above and filling in below equalizes the grade, so that the same quantity of water would carry nothing but the small gravel and light material, such as is found in the top strata of the existing gravel deposits.

Here then we would find a gravel deposit where Indian canyon was corresponding in every detail with the deposits seen in the hydraulic banks of to-day.

The illustration might be extended. While this modern channel followed the course of Indian canyon to the westward, a big slide might occur and change its course to the southward, where it would find a dumping ground in Shirt-Tail canyon and there form another gravel deposit. It will be observed here that this cutting out and gravel depositing process is going on during the intervals between the lava flows, which are known to be at irregular periods. When a lava flow takes place after those gravel deposits are formed, the break in the rim that let this gravel out, being too small to carry the large quantity of lava, the result is, the gravel deposits are partially capped and the break completely blocked up. A similar break might occur to the north toward Bear river, and under the same conditions would produce like results. It was by these methods that

The Modern Channels and Basins

Were cut out and filled up with boulders and gravel. Only on this principle can we account for the numerous channels in the same locality running in opposite directions and gravel deposits many miles apart, having a common source.

In accordance with the foregoing views, then I assume that all of the gravel deposits between the North and Middle Forks of American river, within the gold belt, comprise one independent system and have one common source from the ancient river channel in the Middle Fork divide. It would not accord with the natural order of things for two or more Pliocene or ancient rivers to run unobstructed in close proximity in a mountain region like this. I conclude, then, that there was but one ancient river and its tributaries ran in this divide at the commencement of the volcanic period, and that its obstruction and entire obliteration can be traced directly to the lava flow as the prime cause during that period.

Taking a Practical View

Of the whole subject, aside from geological theory, it must be obvious that the entire slope from the summit of the Sierras to the sea, and from the lava beds in the North, several hundred miles to the South, was involved in the great revolution by which a whole grand river-system was obliterated and a new one established.

From the standpoint on some high lava ridge

in the gold belt, the various existing conditions are accounted for.

The indications are that the volcanic period was ushered in by some great convulsion that gave existence to the coast line range of mountains, and sunk the intervening region between this range of mountains and the Sierra Nevada, a thousand feet below sea level. To account for the varying conditions observed throughout a large extent of Central and Northern California, in regard to this subject, the country between the coast line of mountains and the summit of the Sierras may be

Divided into Five Sections.

Each one distinguished by conditions as peculiar and marked as if separated by a mountain range, but still holding inseparable relations with each other with reference to the final result.

1st. This section includes what is now the Bay of San Francisco, the Sacramento and San Joaquin valleys.

2d. The lower foothill country, extending from the valley to an altitude of about 1500 feet ("the citrus belt").

3d. The upper foothill country; this section includes the country between the "citrus" and gold belts.

4th. The gold belt.

5th. The mountain section extends from the gold belt to the summit of the Sierras.

In regard to the first section, it must be obvious that the sinking or subsidence here accounts for the change of level, and from the immense deposits of gravel—from 500 to 1000 feet deep—in these valleys below sea level, we conclude here is the center of the great depression, toward which the subsequent erosions converge.

This change of level effects a two-fold purpose, in giving the opportunity for erosion in the higher sections, and forming a vast dump for the material brought down.

Whether these gravel deposits were brought down by the ancient or modern system, or not, is immaterial. The indications are that the lower foothill country was not materially affected, except by having the lower portion submerged by the accumulating waters in the landlocked section below.

These ancient rivers had been dumping their golden gravels along this lower foothill section much in the same way that tailings are dumped from the flume of a hydraulic classifier, filling up depressions, blocking up in one place and cutting out in another, thousands of years before the Volcanic period was ushered in. It appears the flow from the first eruptions consisted, principally, of mud and slinkens (similar to the material emitted from a volcano recently, in Japan). Immense quantities were emitted before the lava began to flow to any great amount, filling up the ancient channels in the gold belt, in some places a mile wide and 200 feet deep, and following those channels down to their dumps in the lower section, miles in extent, to a considerable depth, was deposited in the valleys. In the gold belt this material generally overlies the bottom pay deposit in the ancient channels, and by most miners is called "mountain cement." In the valleys the same material from the same source is termed "hardpan."

It is evident that at some period of time the water covered the lower foothill section to an altitude of 400 to 500 feet above the present sea level.

That the Stationary Sea

Ever attained an altitude of 500 feet along this foothill section is improbable; and this condition is accounted for in a more natural and reasonable way. By the uplift of the Coast Range from 500 to 1000 feet above the sea in a continuous, unbroken line, all communication between the sea and this inland depression was cut off. Under these conditions, it must be obvious that the drainage-waters and detritus, from 300 miles in extent on the west slope of the Sierras, would in time form a great landlocked sea, whose waters would rise along the foothill section until they reached some low egress in the Coast Range, and there out an outlet down to sea level. We can see to-day where this low egress was. The changed conditions here are more remarkable, if possible, than in the gold-belt section. The erosion at this sag has given us the world-renowned Golden Gate through which the largest ships afloat can securely pass into the largest and finest harbor in the world.

The transformation was not complete till the waters of this great inland sea had subsided, through this outlet, to sea level, and left us two majestic rivers—one from the north, the other from the south—the Sacramento and San Joaquin, with their extensive valleys, containing thousands of acres of the richest lands the sun shines upon, made from the detritus and eluvials from the high mountain sections. If this theory is correct, the point of elevation where this outlet commenced cutting away at the Golden Gate will determine the high-water line along the lower foothill section and account for the extensive subaqueous gravel deposits observed in the valley section.

The Changed Conditions

Have been outlined and accounted for in the valley section. Its important relation to the other sections is apparent when we consider the vast dump formed for their outlets and the advantage given for modern erosion.

As before stated, the indications are in the early stages of the volcanic period the flow consisted chiefly of mud and ashes which only

filled up and widened out the enolent channels in places; then afterward the lava and heavy material was carried down at intervals, and where the conditions were favorable formed permanent dams, blocked up the rivers and diverted the waters into some lateral depression or tributary unaffected by the lava, and by this method, from the change of level, commenced the modern erosion.

(To be Continued.)

Water on the Pacific Coast.

Contamination in Storage Reservoirs and the Palliatives Resorted to.

(Concluded from last issue.)

Troubles in the Pipe System.

A careful study has been made of the quality of the water as delivered to consumers.

First—The San Francisco supply is derived from six different sources, all told, and consequently when the waters in any given storage reservoir become too turbid for use, they are enabled to shift the supply from one source to another, less affected, and thus to a large extent avoid delivering muddy water to consumers.

As soon as the rains cease, the water in the reservoirs clarifies rapidly, and in the course of three or four weeks becomes quite clear, and is very good in quality. About the first of June, however, offensive odors begin to develop in the supply to consumers in San Francisco, but nothing comparable to that experienced by consumers in Oakland. A careful examination made along the conduits from the reservoirs to San Francisco established conclusively an important fact, namely, that while the waters in the storage reservoirs were very bad, fully as bad as the waters in the Oakland storage reservoirs, yet as we advanced along the conduits it was observed that at all the open flumes and aqueduct tunnels, where the flow of the water was exposed to the air, the quality of the water continued to improve progressively, until finally, when it reached the vicinity of the service reservoirs, within the city limits, the quality was at all times very much better than the surface waters in the storage reservoirs whence it came, and consequently incomparably better in quality than the water delivered in Oakland.

The experience in Oakland is quite different, and deserves careful consideration.

Change in Water at Oakland.

Second—During the winter and spring months the surface-water in the reservoirs is allowed to run directly into the supply pipes, sedimentary matters due to storm waters included. As a natural result, more or less sedimentary matter is deposited in the pipe system and quite extensively in all the dead-ends and fire hydrant branches, in fact everywhere that circulation is poor or bad. During winter storms much of the finer loamy sediment finds its way to the faucets, and gives rise to universal complaint. As soon as the rainy season is ended, however, the water improves rapidly and for a certain period in the spring is clear and really very good.

The supply continues to be reasonably good until about the middle of May, when disagreeable odors begin to develop, and especially when water is drawn from the hot-water faucets the odors are excessively offensive. A very important fact should be noticed here, that this offensive stage in the pipe system precedes by one month the same period in the reservoir, and furthermore, the most common-place kind of test, as well as chemical analysis, show conclusively that during the entire putrefactive stage in the reservoirs, the water in the pipes supplied to consumers in Oakland is always very much worse than the surface water in the reservoirs whence it came.

Direct examination shows that the true explanation of this fact may be traced to the deposit of filthy mud in the pipes, which is undergoing putrefaction (similar to that which subsequently takes place in the reservoir on a grand scale), but under infinitely worse conditions, from the fact that it is confined in the pipe system and excluded from contact with the air.

About the middle of June putrefaction begins in the reservoir, and as a result a fresh supply of decaying remains of vegetable and animal matters enter the supply main, thus adding new fuel to the fire and increasing the evil.

Experiments show that these two sources of contamination are sometimes so active and potent that the temperature of the entire water supply to Oakland is affected thereby. About the 1st of September, 1889, the Water Company began putting in new cloth screens, six thicknesses being used instead of two, as heretofore. A close watch was kept on the temperature of the water in the street mains, and in less than four days following their introduction, the temperature of the entire water supply, some 5,000,000 gallons per diem, had dropped from 72° Fahr. to 65° Fahr., and then continued at the latter temperature for the remainder of the month.

An examination of the mud in the pipes shows what might be expected, that it is of the same composition as the bottom mud in the reservoir, and also that during the putrefactive stage is very offensive, and contains active red worms.

Palliatives Resorted to.

Any one might naturally think after reading the above, that sand-filtration would be the

proper remedy to apply in order to improve the water during the summer months. A little reflection will show that the physical conditions are such as to render it impracticable. That is to say, the quantity of vegetable and animal matter in the water in midsummer is so great in amount that it would clog a filter-bed completely in a very short time, and it would consequently cease to work until cleaned. Hence it is interesting to know what is practicable under existing circumstances.

San Francisco Water Improving.

Nothing is done at the storage reservoirs to improve the quality of the water before entering the conduits. The water first passes the fish-screens and thence through open flumes and aqueduct tunnels, and finally through wrought-iron pipes to the city. At the outlets where they empty into the several service-reservoirs, is located the so-called screen-house, where the water is made to pass through a system of cloth screens before it is allowed to empty into the service-reservoirs. These cloth screens are constructed as shown in Fig. 1, page 435. The sash-frames are six feet long and two feet wide. Brass wire netting is tacked on, and over that is stretched a good quality of cotton cheese-cloth. In midsummer, when the water is foul with animal and vegetable matter, the screens clog rapidly and have to be removed and clean ones put in their place. The fouled screens are taken to the wash-room, where they are thoroughly cleaned, and the foul wash waters are allowed to escape by a suitable drain-pipe to the bay. Each one of these screen-houses requires the constant employment of double shifts, four men 12 hours each, raising, cleaning and replacing the screens, some 300 being required for each house. Generally the water passes through two screens. When it becomes necessary to make a change, the outer screen, being little fouled, is removed first and a clean one quickly put in its place; the inner, or fouler one, is next removed and a clean one quickly put in its place. This screening apparatus is unquestionably very efficient in its way, but, as will be seen further on, it does not touch the fundamental seat of the chief trouble, which lies in the storage reservoirs. It should be mentioned that these service-reservoirs have a division wall through the center, thus enabling one-half to be emptied and cleaned while the other is in use. In summer this requires careful attention.

The Method at Oakland.

The water supply at this city adopts a different method, in some respects, and it is interesting to know that the results obtained are much less satisfactory. Here the screen-house is placed at the storage reservoir, instead of in the city limits, and distant some 9.5 miles. Two varieties of screens have been in use, both identical in principle. Those introduced in 1879 are best shown in detail by the accompanying drawing (Fig. 2) with descriptive notes thereon. Those used in 1889 differ only in design. The foul water is made to pass through six thicknesses of cheese-cloth wrapped around wire cylinder, and the screening process is necessarily more efficient. This system is shown in detail in Fig. 3, page 435.

The screened water passes into a clean-water basin, capacity about 2,000,000 gallons, which is not covered. The hot summer sun has developed a large amount of vegetable growth in this basin and a second one has thus been built, thus enabling one to be emptied and cleaned when occasion requires it.

The screened water from the basins passes into the 37½-inch supply main, and travels slowly to the city of Oakland and direct to the consumers, there being no service-reservoir.

Results Accomplished.

In the case of San Francisco, the quality of the water delivered to the consumers throughout the year may be characterized as reasonably good, and as a rule complaints are seldom made and can always be traced to some local temporary cause. In the case of Oakland, however, the entire water supply delivered to consumers during winter, summer and fall, is always bad, but is reasonably good in the spring. In the summer and fall of 1889, when the water in the storage reservoir got very low, a large number of citizens ceased to use the water either for potable or culinary purposes. They organized a company and brought spring-water from the hills at considerable expense and inconvenience.

This extraordinary difference in the quality of the water naturally calls for an explanation. After studying over the existing facts, I have come to the following conclusions:

First—Experience at San Francisco shows that the quality of the water is greatly improved by flowing through open flumes and aqueduct tunnels before it reaches the city. On arriving at the service-reservoirs, the water is further improved by passing through cloth screens, and thence passes into the distributing reservoir, and soon reaches the consumers before secondary deterioration in the pipes has had time to develop.

Second—It is clear that the Oakland Water Company made a mistake in placing their screening apparatus at the storage reservoir. I sampled the surface water in the latter and found it to be reasonably good; then I sampled the screened water near by and found it to be much better. This screened water entered the supply main, and thence travels a distance of 9.5 miles to Oakland consumers. Experience shows that the quality of the water delivered is always worse than the water in the storage reservoir.

This secondary deterioration is unquestionably due to the putrefactive fermentation in the pipe system. The water company now proposes to build a 150,000,000 gallon settling-reservoir within the city limits, and then transfer the screening apparatus to the same site. I have no doubt but that these new works will improve the quality of the water considerably.

These systems of cloth screens, when properly managed, have certainly proved to be quite effective, as far as they go, but they do not, in my opinion, strike at the fundamental seat of all the worst troubles. This conclusion is based on the results of a long series of observations, which have been under way for four years, and are still going on. They show conclusively that the main trouble from contamination in midsummer is primarily due to the fermentation and subsequent putrefaction of the immense deposit of oozy mud in the bottom of the reservoirs. Hence the experience on the Pacific Coast goes to show, that generally speaking, the older the storage reservoir the worse the troubles become.

The immense deposits of mud in the bottom have been subjected to certain examinations. Its composition is found to be a mixture of vegetable and animal matter in all stages of decomposition interstratified with clayey sediment and vegetable mold brought in by tributary streams in the rainy season. The depth of this deposit averages ten feet and in places as much as 20 feet in the older reservoirs.

It is impossible to conceive how these storage-waters can be maintained in a healthy condition as long as this source of contamination is allowed to exist. It must be removed, and the question is, how? In India this is done regularly by emptying the reservoirs, and cleaning them out the first of the monsoon, and then by closing the under-slopes they catch all the subsequent drainage. Of course this is not always practicable. I hereby submit a suggestion, which has developed itself during these examinations.

Samples of mud from the bottom were easily obtained in any desired quantity by means of an ordinary hand-pump and 100 feet of stout rubber hose. The same apparatus was useful in getting the temperature and samples of water at different depths. Now the facility with which this oozy mud could be pumped up, without disturbing the purity of the water in the slightest degree, at once suggested the idea of extending this system, and adopting it as a ready means of getting rid of this objectionable deposit at a comparatively small expense, and without emptying the storage reservoir. Also, I think it proper to state that a Gwynn centrifugal pump with a runner, 5 feet diameter, having a suction pipe 17 inches diameter and discharge pipe 15 inches diameter, was used under my inspection, to remove a large quantity of black oozy dock mud. The lower end of the suction pipe was simply allowed to sink down into the oozy mass. The engines were started up, and it was soon ascertained that this kind of material could be removed at the rate of 1370 cubic yards per hour, and this rate was maintained for 9.5 hours, or a daily capacity of 13,000 cubic yards, and without changing the position of the machine. I merely mention this fact in order to show what has been done in this line.

The next question naturally arises, how will the material be disposed of? In some cases it could be discharged into the creek bed below the dam, and be carried off by storm-waters, or preferably, if there be any shallow flowage or lowland near by, heavy embankments of sand faced with gravel could be built, and material pumped behind them, thus making new high land, which would be greatly enhanced in value thereby.

Recapitulation and Conclusions.

After carefully studying all the facts and circumstances obtainable so far, I am led to draw the following conclusions:

First—That the great deposit of putrid mud in the bottom of storage reservoirs is the primary cause which gives rise to the deterioration in quality of the water. That it should not be allowed to accumulate from year to year, as is generally the case, but should be removed from time to time, and the bottom kept reasonably free from annual deposits capable of undergoing putrefaction. That it is practicable to remove this mud at an expense not much in excess of that incurred in pumping water under like circumstances. That if this is properly attended to, the conditions which give rise to excessive vegetable growth will be practically removed, and as a result vegetable life will become so small in amount as to be a matter of little consideration. That as a final result the construction and maintenance of a system of filter-beds would become entirely practicable.

Second—That the trouble with the quality of the water delivered to consumers is largely independent of the contamination in the storage reservoir, and can be traced to two separate sources, namely, turbidity during the stormy months, giving rise to deposits in the pipe system, which subsequently, when the water gets warm, takes on putrefactive fermentation and gives rise to offensive odors during the summer and autumn. That neither of these can be properly removed except by means of subsidence followed by sand filtration.

Finally, if the above fundamental sources of contamination be eradicated as far as possible, I am of the opinion that the greatest of all reasonable objections to storage-waters will be practically removed.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NORTH STAR.—*Ledger*, June 21: This incorporation of Sutter Creek, organized over three years ago for the purpose of developing the North Star claim, between Sutter and Amador, has had a remarkable history in many ways. The sum of \$38,000 has been raised by 19 assessments of two cents each per share. These assessments have all been paid without any stock being advertised as delinquent, which experience is probably without a parallel in the mining history of the State. That the property has been economically and efficiently managed is evidenced by the amount of work done. It is a matter of deep regret that the operations of this enterprising company have not been crowned with substantial encouragement in the discovery of precious metals, for certainly no body of prospectors ever worked harder or more persistently and intelligently than they. It is now the intention to sink the shaft 200 feet deeper, making a total depth of 1000 feet. A thorough exploration by drifts and crosscuts will be made at this depth, which the managers are sanguine will lead to important developments.

MISCELLANEOUS.—Preparations are being made for the erection of a new 10-stamp mill at the McKenzie mine, near Irish Town. The transportation of rock from the Amador gold mine to the mill is still done under considerable difficulties. A cable of smaller size will be tried and will no doubt reduce the trouble somewhat.

FROM SUTTER CREEK.—The mining outlook continues to brighten up gradually. A. H. Griswold, representing San Francisco capitalists, and who has considerable means himself to invest, has gone some distance above here, in company with an engineer, for the purpose of taking water out of the old Caledonia shaft and sinking the same to a considerable depth. The Caledonia is a comparatively undeveloped claim, and has lain idle for many years. Mr. Griswold says his knowledge of the property is such as warrants the expenditure of a large sum to its development. Material for the old Rose mine is expected from the sawmills this week, when the work of cleaning out the shaft will be commenced at once. The Lincoln mill, which has been hung up for a few days to give the miners a chance to break into a new vein, is again running, and the ore is believed to be of a paying quality. C. O. Mitchell has just completed a contract for 1100 feet of five and six inch air pipe for the Hardenburgh mine at Middle Bar, which will be delivered in a few days.

Calaveras.

WEST POINT.—*Cor. Calaveras Chronicle*, June 18: The Lone Star mine has made the largest cleanup since it has been a mine, and has a pile of wealth in sight. Then the Blazing Star is paying off and taking out richer rock than ever, and the other mines are doing well.

FOR COPPER SMELTING.—*Stockton Independent*, June 18: Supt. Ferson of the Union copper mine at Copperopolis and an engineer from San Francisco will go to Milton this morning with Supt. Prugh to select a site for large coke-bins to be erected there for the mining company. Coke is used in large quantities at the copper mines, now that the company is smelting the ore, and the cost of storage and hauling the fuel is a big item. The bins will be erected so large wagons can be hauled under them and loaded from chutes. Coke is often brought to San Francisco as ballast in wheat vessels, and with a place for storage the mining company can take large lots when offered at low rates. The proposition to extend the railroad to Copperopolis has not been abandoned, as is evidenced by the fact that the coke-bins are to be built so they can be taken down easily. The frames will be bolted, and at any time the structures can be removed without destroying the lumber.

El Dorado.

NEW MILL.—*Mountain Democrat*, June 21: Last week a five-stamp mill arrived for use at the Gentle Annie mine. The five stamps now on the mine have been operating steadily since first being put in operation, and the result has been so satisfactory that Mr. Melton has secured a five-stamp mill from Grizzly Flat, which will be added to the present mill on the mine as soon as possible.

GRAVEL.—The development of a rich body of gravel in the Rogers mine at Smith's Flat is encouragement not only to the present owner of the claim, but to all parties working in the old channels in this vicinity. The extensive deposits of gravel along the old channel, which have yielded so well in the past, will yet yield big returns. New portions of the channel are being prospected for, with good results, and we recall a number of claims between Smith's Flat and Morrill's and between Webber creek on the south and Hangtown creek on the north, that during the past year or so have opened out well. Work now being done will before long open out several new bodies of this gravel, from which big returns are almost assured. About the most noteworthy and promising of these developing measures is the bedrock tunnel now being run in the Chili, Stewart and adjoining claims in the Webber creek and Chili Ravine district. The objective point of the long bore will be reached about the first of next month, after which upraises will be made and the gravel sent down through chutes. The gravel is known to be very rich, but an excess of water prevented it being worked from above to any depth. The present tunnel will drain an immense body of gravel.

GRIZZLY FLAT.—Renewed life is apparent about Grizzly Flat this summer, with prospects of a rejuvenation of that camp and the development of some of the well known claims in that vicinity. The Crystal is putting men to work and before long is expected to have quite a force on. The Mount Pleasant is steadily looking after future chances for opening out on a large scale. The Ryan mine at Henry's Diggings is getting its machinery in place and at the same time employing a dozen men. Various other claims, both quartz and gravel, are slowly going ahead and not making any bluster over it. The Linden mine, in Cedar Ravine, came to a sudden standstill at noon on Thursday last. The miners all went to work as usual in the morning, and

nothing unusual appeared to be on the tapis, but at noon all hands were laid off and the night shift notified not to come to work. Times are lively at the Delmatia mine, Kelsey, since the starting up of the electric plant and all the machinery. A full force of men is at work on the mine, and the various Huntington and other mill apparatus is in full blast and working fine. The company are now running through about 120 tons of ore every 24 hours. They have an abundance of power—in fact more than they can utilize at present.

Inyo.

ORE SHIPMENTS.—*Index*, June 18: Davis & Keyes and Silas Reynolds will make shipments of silver-lead ores this week from their mines on the western slope of the Inyo range. The former will ship two carloads and the latter one carload.

THE NEW MINES.—*Register*, June 19: The Georgia and Enterprise mines across the river, owned by Messrs. Hill and others of Bishop, are showing up in excellent shape. There is enough gold ore being taken out to keep the arastra, just built about two miles from the railroad, at work night and day. The ledge carries from 3 to 14 inches of rich gold ore. A tunnel will be run at once upon the ledge and, if results justify, a Huotington mill will be put up. The arastra is in Redding canyon.

AT CERRO GORDO.—*Inyo Independent*, June 23: It is reported that 500 or 600 tons of ore are in sight in the mine recently sold by Dunphy & O'Keefe at Cerro Gordo. The ore is said to be worth at least \$100 per ton. Teams are now hauling ore from this mine to Keeler. Thorough tests have been made of the old ore dumps at Cerro Gordo which prove that there are several thousand tons of ore there that will have a big profit by jigging. Several improved machines have been ordered from San Francisco of the same kind as that recently sent to Darwin by Hon. P. Reddy. When the machines are delivered the work of jigging will be prosecuted vigorously. This will produce a large amount of lead and silver formerly wasted. A crosscut is now being run on the 700-foot level of the Union mine. Surveys showed that this crosscut would tap the ledge 150 feet below the old workings, where so much rich ore was formerly taken out. In other parts of the mine men are taking out ore on tribute.

DEFIANCE.—Very thorough prospecting has been done of the ore dumps and the various levels and drifts of the Defiance mine at Darwin. From all this Mr. Reddy is satisfied that extensive improvements may safely be made. He has bought about 5½ miles of water-pipe and will at once put in new water-works. He bought out the Darwin water-works some months ago. As soon as the water-works are put in thorough order, work on the mine will be extended. At present only four or five men are employed there.

Nevada.

WASHINGTON DISTRICT.—*Grass Valley Union*, June 20: John Eddy, who has had much experience as a miner, has been in the Washington district, in this county, for several weeks, and is very favorably impressed with the appearance of the mines and believes that the district is going to be one of the best in the State. He speaks particularly of the Washington mine, which he has had the best opportunity of examining, which has two distinct pay chutes, the lode showing a width of from six to seven feet on the 400-foot level, the ores being free-milling and the sulphurets of high grade. The Washington is now producing well and has considerable extent of ground opened, that will furnish ore for the mill for a long time to come. Much attention has been given to development work, and the 20-stamp mill can now be kept going steadily. The pay chutes on the lode are 400 feet apart, and the pay ore shows well in free gold. The quartz lodes in the district are generally large, and the ores being of a free-milling character, give much encouragement as to future value and permanency. The Washington, Yuba and Eagle Bird are the representative mines of the district, and all good producers, and it is certain that other properties equally as productive are yet to be opened.

HARD ROCK.—*Tidings*, June 19: The Emmett W. & M. Co.'s shaft, down between 80 and 90 feet, is in very hard rock. Sinking is costing \$25 a foot at present. The California mine, near Graniteville, has started up with 20 men. The severe winter interrupted operations. At the San Jose drift mine there is a depth of 5½ feet of gravel carrying considerable gold. The width of the channel has not been ascertained. Gravel is being hoisted right along, and washing will commence next week.

GERMANIA BASIN.—*Ketchum Keystone*, June 18: Mr. S. H. Hayes gives an interesting account of the workings of the district. Mr. Hayes has worked the Tyrolean mine all winter, and has gotten out quite a large amount of ore. On account of the surface water he had to quit for awhile, and, therefore, went to work on the Emma mine. He struck a nice body of ore and got out in the neighborhood of 25 tons in 20 days work with two men. Ike Click is jigging from 10 to 15 sacks of ore per day. The ore assays about 165 ounces in silver, 65 per cent lead, and \$25.90 in gold. Nick Millick is working the Idaho, which belongs to Woods & Phillips. He is taking out from one to one and a half tons per day. Dave Fayel is working the Summit mine, and has a good lot of ore out, and the mine is looking very well. He will be ready to ship ore in July.

NORTH BANNER MINE.—*Grass Valley Union*, June 19: The North Banner mine is making a fine showing at the present time. The shaft has been sunk to a point for opening the third level below the drain tunnel, where the vein matter between walls is seven feet, of which there is a solid vein of quartz four feet in thickness. As the ledge is showing strong in the level above, this insures a good body of ore in the stopes between, and a known pay chute of over 300 feet in length, which no doubt will be found to be longer as expited upon. A station is now to be cut out at the third level, and after that the sinking of the shaft will be resumed, to be carried down to the fourth level. Heretofore the ore from the pay chute has not been sufficient to keep the 10-stamp mill constantly going, but with the opening of the No. 3 level there will be ore in abundance for this purpose. The present appearance of the mine is such as to justify the highest expectations of its future value, owing to the ledge now being strong, continuous and of high grade. The latest crushing of ore from the mine was cleaned up on Saturday last, being 160 tons, which yielded 278 ounces of melted gold, or

a result of about \$25 a ton in free gold, independent of the sulphurets, which in this mine are always of high grade.

MENLO MINE.—The water in the Meolo (Home-ward Bound) has been about pumped out, as yesterday there was only one foot and a half of water standing in the third or lower level, and this may be drained to-day, when the work of drifting can be commenced. Pumping was commenced several months ago, the mine being then filled with water, and the ground generally so completely water-soaked by the heavy rains of the winter that it has been a long contest to get the upper hand of it, and besides there was a large amount of work to be done in clearing out the caved ground in the shaft, and to do necessary retimbering. Work will now go on without interruption. The new hoisting works on the Wisconsin mine, also a part of the Menlo property, are completed, and the intention is to start up steam to-day.

THE GREAT TUNNEL.—*Herald*, June 20: The tunnel which has been started from the South Yuba river, and headed for Grass Valley, is an important enterprise, and if carried to completion will result in great benefit to the section of country through which it passes. By glancing at the map of the country it will be seen that there is a network of ledges crossing the line of the tunnel in several places. The developments that may be shown by the tunnel can hardly be guessed. There are doubtless many ledges along the line that do not crop out to the surface that will be struck. There is a big gamble in the proposition, and it is to be hoped that the parties who have started the project will complete it. We understand one of the principal backers will soon reach here from New York.

Placer.

THE MINARICA MINE SOLD.—*Herald*, June 21: The Minarica quartz mine on North Ravine has been sold by J. W. McCullough to Eastern capitalists who are going to work to develop it thoroughly. Already timbers and lumber are being hauled on the ground for the erection of a new mill and hoisting works. Col. McCullough, we understand, retains an interest and will have the superintendency of the property.

A RICH MINE.—Rock is being taken from the main shaft at the Moore mine and also from the east shaft, and in both the ore continues very rich. Mr. Thorpe, one of the owners, was in town last Saturday, and he informed us that the output of rock for the day before he thought would yield at least \$1000. From near the surface this has been a phenomenally rich lead, and its especial merit consists in the fact that the deeper they go the better it gets.

Shaeta.

POCKET MINING.—*Redding Free Press*, June 21: Pocket mining is a science, and besides a thorough knowledge of prospecting, requires lots of patience, backed up by zeal and industry. It is said of two pocket-hunters (on Rock creek, two miles above Redding) that they have taken out some \$18,000 in the past four years. Two of them, about this many years ago, sank a hole near where another pocket-hunter had vainly tried to find a pocket. Drifting in, they prospected every pan of dirt, each succeeding pan seeming to produce less colors of gold. Finally a pan of earth was hoisted up, and while the partner on top was panning it out for colors, the man in the shaft stuck his pick into the side of the shaft, and upon withdrawing it noticed gold on his pick-point. As the result of the stroke of the pick, some \$4336 was taken out in a short time, and not long since these same men found a lump of quartz and gold valued at about \$300. Such is pocket mining.

NOTES.—Much prospecting is being done at the present time, and Castle creek still commands the attention of numerous miners. Twenty thousand dollars per month with a 20-stamp mill is the yield of the Sierra Buttes (formerly the Uncle Sam) mine of Squaw creek. The Texas and Georgia mine of Old Diggings is looking better than ever. During the past year over 700 feet of tunnels have been run and over 500 feet from the surface there is an extensive ore body that will work \$100 to the ton. The Sky Blue mine above Middle creek, owned by E. P. Connor, promises to be one of the choice mining properties of the county. He has a shaft down 25 feet, on a rich pay chute of rotten quartz and rusty gold, very rich.

Sierra.

YOUNG AMERICA.—*Mountain Messenger*, June 21: It is reported that a Mrs. Plum, of San Francisco, has secured a bond on the Young America mine for a large sum. The lady was up there some time inspecting the mine. She is the first female rock sharp that has ever visited this section. Perhaps we should have said "promoter" instead of rock sharp.

Siskiyou.

QUARTZ AND GRAVEL.—*Yreka Journal*, June 19: The quartz from Charley Abbott's ledge on Greenhorn, crushed at the mill on Yreka Flats during the past two weeks, paid exceedingly well, and Charley feels bappy, with intention of taking out plenty more as soon as possible for another crushing. Thornton Thomas and George Blessing have a fine three-foot ledge in Spring Gulch, a short distance north of Yreka, which prospects very rich and averages about \$20 a ton in milling, but they are troubled with water in sinking their shaft. They wish to prospect it thoroughly to ascertain its extent, with a view of running a tunnel for drainage and working from a low point on Yreka Flats. The owners of the Joe Bentz claim on Klamath river have commenced hoisting pay gravel and expect to take out considerable dust between now and the 4th of July on the cut just opened. The McConnel claim on Klamath river, at mouth of Humbug creek, is almost opened for hoisting pay gravel from the old channel, with expectation of taking out considerable gold-dust after this week. Several other companies on Klamath river are getting down to pay gravel inside of their wing, head and foot dams, so that by the 4th of July all will be taking out the glittering dust in great abundance. Down in the Oak Bar and Humbug Bar sections of Klamath river, the miners are almost ready to commence hoisting pay gravel, and those engaged in drifting have been doing well for some time past. The quartz-mills of Boyle & Co., McCook, Hegler Bros. and Bruce Aldrich on Humbug Creek, are all in operation, and a large number of hands are busy in the ledges getting out quartz to keep them in operation steadily from now on until winter storms

again interfere with their work. At Little Humbug the miners are doing better this summer than for many years past in the placer claims, and when the water becomes short will work quartz ledges adjoining them, which prospect very rich. Louis Fahl and O. H. Lawson, who are now sinking down on their ledge at north fork of Humbug, have found very rich quartz, the ledge varying from six inches to two feet in width. The quartz pounded out in a mortar paid about \$9 to the pound, and pieces shown us contained considerable gold plainly visible to the naked eye.

NUCKET.—*Yreka Journal*, June 20: We learn that Dave Starr, a well-known mining prospector, picked up a seven-ounce nugget at Indian creek last week while prospecting. The Chinese Hydraulic Mining Co. at Spring Gulch, on Yreka Flats, is making a cleanup from successful run of two months, and expect to have water enough to run their giants another week or so. From the bedrock they have cleaned up about \$6000, with considerable more bedrock to clean and nearly a mile of sluices. The quartz-mills of Boyle & Co. and Hegler Bros. on Humbug are kept running steadily day and night, with a large number of miners at work stoping out quartz. Spencer & Co. are also getting out considerable quartz and keep McCook's mill at Forks of Humbug busy day and night.

Trinity.

NEW RIVER MINES.—*Journal*, June 20: The Uncle Sam quartz mine of New River has been purchased by John Thyngre, John Boles, E. C. Dennis and James Gulick. They took possession June 1st, and are now at work on ore that mills from \$20 to \$30 per ton. The ledge is about 20 inches, but it improves in quantity and quality as they drive in on it west. They have a five-stamp mill on the property and are doing well. Clements & Ladd are running their three-stamp mill on good ore. They recently struck a new ledge in the footwall that prospects from \$40 to \$100 per ton. Fairburn & Fullmore have leased the Tough Nut mine and are getting out some good rock. The Sherwood mine is being worked by five men; the ledge runs from 6 to 18 inches, and the company has no cause to complain of the yield of bullion. Mr. Thyngre, who gave us the above information, says he thinks the Ridgeway mine will yet turn out a bonanza, although they have had some drawbacks. He says the camp is all right but the ore is not of the highest grade.

NEVADA.

Washoe District.

SIERRA NEVADA.—*Virginia Chronicle*, June 21: On the 630 level the west crosscut from the south-west drift, 600 feet from the shaft station, is advanced 240 feet, the face continuing in porphyry and clay.

UNION CON.—On the 1465 level from the north lateral drift, opposite west crosscut No. 4, east crosscut No. 1 is in porphyry and clay.

MEXICAN.—On the 1465 level at a point 70 feet south from west crosscut No. 4, west crosscut No. 5 is in softer porphyry.

OPHIR.—On the 1300 level the winze at a point 10 feet southwest of the raise is down 32 feet, continuing in low-grade quartz.

CON. CALIFORNIA & VIRGINIA.—On the 1650 level a south drift is advanced 145 feet on the east side of the stopes. In working out from raise No. 8, continue stoping ore, 30 feet below the connection of that raise with the 1500 level north drift from the Con. Va. shaft. In the northwest drift, 60 feet from raise No. 8, are extracting ore above the sill floor. There has been extracted during the week, from all parts of the mine, 2746 tons and 1250 pounds of ore. Shipped to the Morgan mill 1099 tons and 910 pounds of ore and to the Eureka 1647 tons and 340 pounds; battery sample assays showing an average value of \$22.50 per ton; [2730 tons milled]. Bullion valued at about \$13,000 now on hand in the local assay office. Shipped bullion valued at \$55,363.94 to the Carson Mint.

SCORPION.—The southwest drift from the 660 level shaft station is advanced 650 feet and continues in clay and porphyry.

ANDES.—On the 420 level the north drift from west crosscut No. 2 is in 30 feet; formation quartz and porphyry giving low assays.

SAVAGE.—Shipped 508 tons of ore, showing an average value of \$20.32 by battery sample assays. The 1300 level north drift is showing five feet of good ore. No change in explorations at other points. Bullion on hand valued at \$13,516.70.

HALE & NORCROSS.—A 1300 level north line east crosscut is in 70 feet, showing ore. Shipped 1120 tons of ore during the week, showing an average value of \$19.50 per ton by battery sample assays. Bullion on hand valued at about \$28,000.

BEST & BELCHER.—On the 1200 level west crosscut No. 4 is extended 35 feet. Formation, soft porphyry.

GOULD & CURRY.—On the 400 level the north-west drift is extended 125 feet. Formation, soft porphyry with streaks of quartz.

WARD COMBINATION SHAFT.—The 1800 level east drift is out 435 feet; the face continues in porphyry.

POTOSI.—The winze is down 180 feet on the slope below the 930 level, the last ten feet in good milling ore.

ALPHA.—The 600 level east crosscut is in 220 feet, the face in quartz giving good assays. The 600 level west crosscut is in 205 feet, the face in quartz.

CON. NEW YORK.—The 650 level west drift is in porphyry. The 660 level north drift continues in low-grade quartz. The north drift from the top of the raise above the 800 level is out 87 feet; the face continues in low-grade quartz.

SILVER HILL.—The east drift from the winze below the 800 level is out 78 feet, the face showing bunches of quartz.

IMPERIAL.—The joint Confidence-Challenge west crosscut No. 2, same level, is in 120 feet, the face in low-grade quartz.

YELLOW JACKET.—Shipped 560 tons of ore showing average assay value of \$22 by battery sample assays.

CROWN POINT.—Shipped during the week 870 tons of ore, showing an average value of \$20.85 per ton by pulp assays. A west drift from the 400 level raise is out 67 feet.

CONFIDENCE AND CHALLENGE.—The joint Imperial 1000 level north drift from west crosscut No. 1 is out 60 feet, the face in low-grade quartz.

BELCHER.—The 1300 level east crosscut is in 112 feet. It passed through a narrow streak of quartz

assaying from \$5 to \$20 per ton and the face is now in quartz and porphyry.

CHOLLAR.—Extracted 489 tons of ore, battery sample assays showing a value of \$22.50 per ton.

EXCHEQUER.—The 500 level north line east crosscut is in 260 feet, and continues in quartz and porphyry.

SEG. BELCHER.—The raise above the 1000 level east crosscut No. 1 is up 82 feet, the top continuing in low-grade quartz.

JUSTICE.—During the week crushed 154 tons of ore showing a value of \$33.96 per ton by battery sample assays. The raise above the 622 level continues in low-grade quartz.

ALTA.—The ore output this week was 360 tons, showing an average assay value of \$22.50 per ton by pulp assays.

OVERMAN.—Shipped 488 tons of ore during the week, showing an average value of \$24.78 per ton by battery sample assays, of which \$16.65 was gold.

UTAH.—On the 725 level the incline raise is up 128 feet above the south drift, the top continuing in porphyry and quartz.

OCCIDENTAL CON.—Continue to extract ore of good quality from the stopes on the 400 and 450 levels.

Reese River District.

BULLION OUTPUT.—Reese River *Reveille*, June 19: Wells, Fargo & Co. have shipped from Austin from 1865 to 1888 inclusive \$24,929,699.92 in silver bullion. Just think of that sum. And yet this section of country is overlooked by capitalists seeking profitable investments. Of late years we have been asleep, and if we don't wake up we will snore and serve new-comers from out of the intention of remaining here. If we had nothing to offer, it would be a "horse of another color," but we have prospects that are worth many thousands of dollars. What we want is a Western company to come here and start developing some of the favorable mines that can be secured. Then we will see what mining is, and what can be done with capital scientifically directed. Over \$24,000,000 in silver bullion. That would make quite a pile to erect to the memory of Austin's mines; and who can say that there is not as much again in these silent hills? We have plenty of mines whose surface has only been stirred. What we need now is capital to stir them deeper.

Sylvania District.

BODY OF ORE.—*Chloride Belt*, June 21: There are now employed by the Sylvania Mining Co. 65 men all told. The shaft is down 86 feet. A drift was recently run from the shaft and a large body of ore uncovered which will run the smelter for several months to come. Mr. Fife, the superintendent, is now below, and on his return they will start the smelter. The mine is in Nevada and the plant in California, being only a few hundred feet apart.

Tuscarora District.

NEVADA QUEEN.—*Times-Review*, June 20: Joint crosscut between North Belle Isle and Nevada Queen has been advanced 11 feet; having no timber has retarded progress. The face is all in the vein showing some iron pyrites and water.

NAVJO.—South drift from Belle Isle line crosscut 250-foot level, extended 14 feet and suspended.

YOUNG AMERICA SOUTH.—The engine was started up yesterday and works satisfactorily. All work at present is confined to first level. As soon as it is in thorough working order, will commence on second level.

GRAND PRIZE.—400-foot level: Winze stopes show an improvement in grade of ore. Stopes on old east and west vein yielding usual quantity and quality of ore; 520 tons of ore delivered to the concentrator this week. Everything running all right.

BELLE ISLE.—North drift, 150-foot level, extended 11 feet. No. 1 north drift from Navajo line crosscut, 250-foot level, extended 17 feet. South drift from west crosscut at the north end, same level, extended 12 feet, showing some low-grade ore. South drift from the North Belle Isle line crosscut, 350-foot level, extended three feet, showing a good width of high-grade ore. An upraise has been started from the drift six feet from the face, and carried up seven feet on very fine ore.

NORTH BELLE ISLE.—The stopes above the 300-foot level have improved some since last report. The concentrator is running smoothly.

DEL MONTE.—3d level: Have started an upraise on the line, which is now up 17 feet in good working ground. Work in north drift has been discontinued until upraise is through, so as to ventilate this part of the mine.

NORTH COMMONWEALTH.—2d level: No. 1 south drift from east crosscut, in 141 feet, extended 16 feet in porphyry. No. 2 south drift from same crosscut has been run 13 feet, total, 80 feet, cutting small seams of good ore. No. 2 north drift from east crosscut advanced 12 feet, showing some ore in the face. Joint upraise is up 52 feet, six feet made during the week; top is in vein porphyry.

ALASKA.

NEW DISTRICT.—*Chronicle*, June 24: A new mining district has been organized in Western Alaska called the Cleveland Mining district and including the whole of the Kenai peninsula. John G. Copp has been elected recorder for the first year. The object of the organization is to locate and develop a number of coal mines situated near Coal Point. Willoughby & Ware's mill at Hunter bay is nearly completed, and will start up in about ten days. The owners of this mill have a fine lot of high-grade ore on the dump, and expect to realize well from their investment. At the Sheep Creek mine everything is progressing satisfactorily. The Silver Queen is turning out some fine rock.

ARIZONA.

MOHAVE NOTES.—*Miner*, June 21: Jim Cadden is taking out some good ore on the Dana. Supt. Jno. Barry has his mill running at full blast on Minnesota ore. McKinnon & Koster are having 12 tons of Alta ore worked this week. The Flores will have their hoisting works in running order by the last of the week. McDuffee & Heimrod brought in ten tons of high-grade ore from the Sunset mine on Thursday. Gross Bros. & Canyons are taking out some first-class ore on the San Antonio. Supt. Chas. Harding Park, of the Sabbath Bell mine, has commenced work with a large force of men. Messrs. Hughes and Mitchell, of the Silver Wave, '89 and Dolphin mines, have been in Kingman this week completing the sale of these properties to Judge Page-

of Los Angeles, Cal. Twigg & Kelley, of Cerbat, have just had 184 sacks of ore from their Lexington mine worked by the Kingman Sampling Co. The amount was a little less than nine tons, and assayed \$8.51 in gold and \$57.08 in silver. This was an experimental shipment, and will be repeated regularly, as there is a large quantity of ore in the Lexington, which will soon be one of the leading producers of Mohave county.

COMET.—*Tombstone Prospector*, June 22: The Comet is producing an immense quantity of shipping ore of good grade. There appears to be no end to the quantity, and the quality has improved wonderfully since the heavy shipments of six months ago. The Comet owners have a standing offer from Socorro to take 65 tons per day. At present the output is about half of that. As soon as the returns from a 20-car lot are received, the company will determine whether or not there will be a living proposition in putting out the maximum amount desired by the smelting men. If so, there will be many more men put to work. The Independence mine is making a very flattering showing that cannot but be a source of gratification to the owners. The air connection between the tunnel and incline having been made, the ventilation in the lower levels is excellent. The recent excavations made in running these connections brought to sight plenty of good smelting ore, chiefly containing argentiferous galena, cerussite, and micasite, the sulphide, carbonate and oxide of lead. The mine looks better in every particular than ever before in its history.

BRITISH COLUMBIA.

KOOTENAY LAKE MINES.—*New Westminster Truth*, June 21: Several new ledges have been located between Nelson and the Columbia, each giving a prospect. On Eagle creek the American Co. has put up a small stamp-mill and has crushed a quantity of the ore. A cleanup of the plates has given a more than satisfactory return, and if the ore carries sulphurates in considerable quantity the success of the mine is assured. Little work is being done at Hot Springs Camp at present. It is understood that the St. Paul expert has reported favorably on the Blue Bell claim and a smelter will be erected on the property. Dr. Hendryx will await the railway connection of the Great Northern (which is expected to reach Kootenay river in a couple of months), before bringing in the necessary machinery. At the Hall Brothers' mine on Toad mountain, a new tunnel is being driven in. It was reported that 800 oz. ore had been struck in this tunnel. This is not so, for the ore had not been reached. Mr. Atkins has purchased a half interest in this mine, and, with his associates, will thoroughly open it up before putting in any machinery.

COLORADO.

DUBUQUE TUNNEL.—*Aspen Times*, June 20: The permanency of the strike in the Dubuque seems now assured. There are now two places in the mine, each showing four feet of good ore. Ex-President John Scott of the Midland, who is one of the principal owners in the lease, visited the property last week and was well pleased with the showing. Shipments are now being made by jack-train, but a wagon-road has been surveyed and will be constructed in the near future which will greatly facilitate transportation.

RICHMOND HILL TUNNEL.—The site has been chosen for the Richmond Hill tunnel, which is being projected by St. Louis parties. The tunnel starts in near the level of Castle creek, back of Highland. The first place selected was farther up the gulch. The present location brings the tunnel nearly 250 feet lower down the mountain. The company has located five claims back of Highland, through which the tunnel runs. A contract will be let this week for the first 300 feet of work.

NOTES.—The Little Rule has made a connection with the shaft on the Hannibal. This gives it air, and it will now be possible to push work. The mine is looking well. The pump that has been put in at the Champion on Smuggler mountain has just been started up, and sinking will be resumed immediately.

DAKOTA.

A FINE PROSPECT.—*Deadwood Pioneer*, June 21: The Gold Colo M. Co., the property of which is located on the Parsons belt, has as fine prospects as can be found anywhere. Openings have been made in numerous places, all disclosing ore in what seems to be large bodies. Samples taken from the different openings, without any effort at selection, assay \$90.71 silver, gold, a trace, and 65 per cent lead. This last item is in itself an important one, and in connection with the silver makes the best prospect for a mine heard from this year.

THE BAILEY SMELTER.—From seven to ten teams loaded with ore daily pass through the city to the little plant. Every bit of available space is now filled to its utmost capacity.

IDAHO.

EAST FORK BELT.—*Wood River Times*, June 18: The East Fork galena belt will soon rank as the most prolific producing district in this region. After nearly to years of prospecting, its general course, dip and trend, and the location of its bodies of paying ore, seem to be reliably known. The belt is about half a mile in width, in blue lime and shale. The vein matter is porphyry, spar, quartz and ore. It carries three well-defined veins bearing ore. The most westerly of which is the most fertile and richest. There are also cross veins at intervals along the belt. The Courier is located on one of these; so is the Minerva. Both of these claims have yielded ore running from 300 to 700 ounces per ton. This belt is prospected only in spots, but its general course and recurrence is demonstrated for over 25 miles. It is believed to lead to the main Sawtooth range at Galena, to crop out at Boulder Creek, again on Trail Creek, on the East Fork of Wood River, at the head of Indian and Quigley Creeks, at Muldoon and at Era, where it is either buried under the lava or swung to the northeast in the direction of Lost River of Nicholia, and the Rocky Mountains. At Galena the Senate claims are doubtless located on just northwesterly extremity. On Boulder the Ophir group, on Trail Creek the Baltimore and Victoria group, in Parker gulch the Quaker City, Elkhorn and Parker groups, on the

divide between it and the East Fork the Independence group; farther along the Triumph, North Star, Venus, and other groups; on Indian Creek the Jackets; at the head of Quigley the Ophir group, indicate its course. All of the claims or groups of claims just mentioned have yielded greater or lesser amounts. The product is much more valuable than heretofore, the recent rise in the price of lead and silver having added from \$25 to \$150 per ton to the value of the ores of the belt; the improvements in jigging and other machinery used have made cheaper production possible, and owners are no longer in a tremendous hurry to take out the very last cent in sight without regard to the future of their properties. The belt referred to is therefore, for the first time since its discovery in 1880, about to have a chance to make a record.

NEW MINING DISTRICT.—*Avanache*, June 21: In our issue of about two weeks ago we noted the fact that a new mining district had been found on Poison creek, in this county, and that good ore had been found in one of the lodes discovered. Since then we have seen several persons who have been to that mining district. Mr. Brown is interested in a location which he describes as being between granite on one side and porphyry on the other. The lode is about 16 feet in width, showing ore that assays as high as \$364.24 in silver and \$21.10 in gold. The district is about 35 miles from Silver City, in a southeasterly direction, in the foothills, about four miles beyond Doyle's ranch on Birch creek, near the head of what is known as Poison gulch, and in sight of Point No Point. The quartz is of fine grain and of a green color, carrying some metallic silver. As yet little prospecting has been done, but from the way prospectors are flocking in, the country will soon be explored.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, June 19: The Princess Co.'s mill at Alamo is shut down for a cleanup and repairs. The El Paso is running. Lane is running hard and has more ore than he can crush. Kerr's mill broke a pinion wheel and is laid up temporarily. The Santa Clara (Torres) mill is running on Encantada ore, and current report indicates very favorable results. Bob Mattheson, after an illness of two months, is again in camp and will probably go to work on the Encantada. No new strikes in any of the mines are reported.

SEARCHING FOR A LOST MINE.—Messrs. Louis T. Pegot, R. A. Rodriguez and Julian Rodriguez returned this week from a trip occupying two months, over into the Jacoma mountains, between here and Yuma. The express purpose of the trip was to search for a gold mine of supposed great richness, which the Indians assert was worked by Frenchmen as long ago as 1850. It was wholly on the strength of information received from Mexicans and Indians concerning the mine, which they themselves had been unable to discover, that Messrs. Pegot and Rodriguez secured an outfit and went to look for it. They reached the Jacoma mountains in the latter part of April, and after securing the services of the captain of the Indian tribe which makes its home in the vicinity, as guide, they devoted themselves diligently to the search under the general directions of their guide, but without success. Every canyon and gulch within a considerable area was closely examined, but the mine was not found, nor did the party even find a good indication in that region that prospecting had ever been carried on there. However, the men still have faith in the mine and will go and look for it again soon.

MONTANA.

THE PARROT CAVE.—*Inter-Mountain*, June 17: During the past week a cave of immense proportions occurred in the Parrot ground, and all that surface, including the small mines that are being leased by David Bricker belonging to the Parrot Co., settled at least a foot. The blacksmith shop of the Parrot Co. and the outbuildings suffered in the same manner. A great deal of curiosity is felt as to the amount of damage done to that great property below the surface. This mine, as has been frequently stated in this paper, is the most systematically worked mine in the camp, and the cave that has just occurred has demonstrated that fact. The ore that remained between the three and the two was being taken out for the past two months. The method is different in this mine from many others, as in this one the ground is stayed with waste and there is never a pillar left for stay. This part of the mine has been worked out for the past two weeks and the miners have been distributed to lower levels. The ground above has been sinking slowly, and to-day is a solid compact mass of earth between the two and the surface, it only baving extended to the caps on the 200-foot level, doing no damage of consequence even to that level. There is not another mine in the camp that would stand such a strain as this, and it is only owing to the forethought of those who have had the direction of the underground workings. It may be particularly noticeable that no waste is hoisted to the surface from this mine, but if not needed on the sixth it is hoisted to the fifth, run in on the different drifts and dumped down a raise directly over that particular place that needs filling, and where there are men who immediately take it in barrows and put it in position where it will do the greatest good. Below the surface the amount of damage done to the Parrot Co. was not appreciable. This is the second cave that has occurred in this property and in neither of them have they been attended by the loss of life or of a single pound of ore, which is considerable to say of a mine that is as extensively worked as the venerable Parrot.

THE ANACONDA PROPERTY.—*Montana Mining Review*, June 20: The mines of Montana are attracting interest from all parts of the United States, Canada and Europe, and the business of mining in the State is being quickened by it, and its effects are felt in every mining center, especially at Helena and Butte. Just now curiosity in the latter place is excited by the proposed purchase by English capitalists of the Anaconda properties in Butte and Anaconda. It is reported that others are also looking at the Anaconda plants, who are equally desirous of purchasing. It is believed that the company will sell if money sufficient is offered, and public interest in the matter is being manifested in many ways. Rumor says that \$160,000,000 has been offered. The company, however, is not showing any desire to dispose of the prop-

erty. Work is going on just the same as if a sale was not thought of, and new buildings are being erected and new schemes are being developed the same as if no proposition to purchase the mines and plants had been made. The improvements being made will greatly increase the output of the works. Their capacity now is from 3500 to 4000 tons daily. In a few weeks the St. Lawrence and Anaconda mines will be at work with an increased number of men, and the increased capacity of the smelters will not be completed any too soon for the reduction of the immense quantity of ore which will be taken from these mines. It is also said that Mr. Marcus Daly will retire from the management of this great property within a year, but this must be taken with great allowance, as the Anaconda people are not in the habit of talking about what they are going to do. It is claimed that two metallurgists of Butte have invented an improvement to the Buckner furnace which will increase the capacity of each one-half, and that the Anaconda Co. will affix the improvement to all their furnaces. If this is the case, the additional output, 2500 tons daily, will enable them to reduce their own ores and all that is being sent them. The Anaconda is a great property and those who get control of it will have to pay for it.

THE PLACER DISTRICT.—The Dimond Hill and Iron Mask properties in the Placer district are spoken of as being very valuable, the former being bonded for \$50,000. Work on the Silver Dollar in the same district will soon be begun. The proposition for the New Park and the Gold Dust Mining Cos. to unite and sink a shaft between their two properties, developing both from the same shaft, would greatly reduce the cost of development for both, and besides opening up valuable prospects, would add to the interest that is now being aroused in this old district.

STEAM HOIST.—*Boulder Age*, June 18: Steam hoisting works are being put up at the Hiawatha mine, Cataract district. Seven bars of bullion came down from the Holter mine at Elkhorn during the past week for shipment East. The Ruby mine, in Johnny's gulch, continues to improve. The shaft is down about 40 feet, and a fair-sized body of ore assaying over 200 ounces to the ton has been struck. The Wisconsin and Montana Company is sinking two shafts in the development of its property, one on the Custer lode and the other on the White Pine. P. B. Clark of Radersburg has taken a contract to load the ore on the C. & D. dump at Elkhorn on board cars. There are about 2000 tons, and the ore will go to Helena, Great Falls and other points. A spur of the railroad will be run up toward the dump. Work is progressing on the Edna and other properties of the Copper Belle M. Co., Cataract district, and the outlook improves as the work progresses. The Boulder Chief shaft is down 150 feet, and it is to be sunk another hundred feet immediately. Steam hoisting works are being erected. Three tons of ore from the Liff mine, Willow Springs district, went in to some of Helena sampling works this week. The Liff is under \$25,000 bonds to Sam Word and other Helena parties.

UTAH.

WHEELMEN STRIKE AT THE MINGO.—*Salt Lake Tribune*, June 18: Agent Officer of the smelter started last evening that some 20 of the wheelmen at the Mingo smelter struck yesterday morning for an advance of pay from \$2 to \$2.25. This the company declined to give, and as the men threatened to prevent other workmen from taking their places, the company had secured assistance from the United States Marshal's office. No trouble had so far occurred.

ASPHALTUM SHIPMENTS.—The North American Asphaltum Co. is shipping from four to five carloads of prepared asphaltum daily from their works near Thistle station, on the Rio Grande Western. This all goes to St. Louis, where the company was organized, and is used for paving streets in that city. The mine from which the rock is taken is practically inexhaustible, there being a ledge 9 to 11 feet thick underlying hundreds of acres. To get the additional asphaltum to mix with the Thistle product the Gilsonite mines in Uintah county are drawn upon, thus adding still more to the industries of Utah. By the way, the Gilsonite mines are also owned by a St. Louis company which is making regular shipments of asphaltum to St. Louis from Price station, which is the nearest railway point to the mines. The product of that mine is mostly used in manufacturing paints and varnishes.

SAN FRANCISCO DISTRICT.—*Inter-Mountain Mining Review*, June 21: At Deser-t Station in Beaver valley, ores are received by wagon from Osceola and other mining districts on the borders of Utah and Nevada. Black Rock Station is the shipping point for the Cove creek brimstone, 30 miles to the east. From Milford, a spur climbs up westward 1700 feet in 17 miles to the base of Granpian mountain, stopping at the ore-bin of the Horn Silver mine, which shipped to its smelters in Salt Lake valley an average of 90 tons of ore per day for four years, produced lead and silver which sold for \$13,000,000 and paid \$4,000,000 in dividends. For a time the mine almost ceased production, but it is now again paying dividends. Minerals of all kinds abound in the region about Milford, and a line of a hundred miles long swung round about Milford would pass over the great gold placer at Osceola, Nev., the remarkable iron ores of Iron county, the silver sandstones of Silver Reef, the coal of Kanarra and Cedar City, the antimony, salient, cinnabar, lead-silver and gold mines of the Upper Sevier, the brimstone of Cove creek, and the copper of Deseret. The Union Pacific has an extension from Milford to Pioche under construction. Through the instrumentality of Wm. S. Godbe of Salt Lake, the best mines at Pioche have been bought, put in producing condition, and only await the railroad to enter upon a second era of production.

BLUE LEDGE DISTRICT.—*Park Record*, June 21: The season's mining operations in Blue Ledge district have commenced in an unusually lively manner and there is every reason to believe that in consequence of these developments renewed and to be inaugurated soon, this year's ore yield from the mines in the district will be much larger than ever before. A few years ago mining operations in Blue Ledge district were practically at a standstill, but many of those who never lost faith in the merits of the district were finally enabled to push developments on the scale and in the manner they desired. So now the prospect is that old Blue Ledge will come to the front soon with many ore-producing mines.

MECHANICAL PROGRESS.

THE SAND BLAST seems to be coming more and more into use in operations connected with all kinds of metallic manufacture. It has long been applied with great success to the cleaning of iron and steel plates, brass, iron and steel castings, forgings, etc., for purposes where a particularly clean surface is required, free from scales, sand, etc.—such as for turning, tooling, galvanizing, plating, painting, etc. The slightly roughened surface left by the sand-blast causes the tin, zinc, plating materials, paint, etc., to adhere to it with greater force than when prepared by other methods. Hidden surfaces in cored castings can be cleaned by the rebounding of the grains of sand. The blast operates with equal facility upon flat, angular, curved and other irregular surfaces. It is proposed to apply the process to the cleaning and roughening of ship's plates previous to painting, etc. The system of blast employed is that in which steam is used to give the required velocity to the sand; but before the stream of mingled steam and sand has reached the object under operation, it is met by a counter-current of air which sweeps aside the steam and allows the sand alone to pass on, so that nothing but cool, dry sand strikes the object. The steam being thus carried away by a side outlet, connected by means of a flexible tube with an exhausting apparatus, the workman is enabled to readily watch the progress of the operation, and to direct the blast at the proper angle against all parts of the surface. The spent sand falls upon the floor, and is collected from time to time for use again. The apparatus requires steam at 50 to 60 pounds pressure per square inch.

TOOLS FROM SOFT STEEL.—It is asserted that by the new, or Dalziel, process of treating steel, any of the ordinary steels of the usual lengths and shapes for making tools, punches and dies will, when treated, become so soft as to effect a most material saving in the cost of making the desired tool; after having been softened and out to the required form, the steel is banded in precisely the same way as any of the well-known sorts, and it is claimed that the process in no way affects the chemical composition of the metal, but so alters its physical structure as to impart the qualities mentioned. In proof of this, a piece of Jespen steel, which had been softened by this method, was made into a punch for cutting a five-pointed star $\frac{1}{8}$ inch in diameter and unusually sharp at the points, the result showing that in the making of this punch a saving of about 20 per cent was effected in the cost, owing solely to the softness of the metal; after being out it was tempered in the usual way in water, then forced through German silver 3.32 inches thick, also through wrought iron 3.16 inches thick, and as a final test was forced through metal which cut only a part of the star, thus giving an unbalanced pressure tending to heat the punch. It was given a series of tests in this way, not only unusual, but which would not be resorted to except under instructions to pass from one test to another more severe; in this case the tool came out at last as perfect as when it originally left the maker's hands.

STEEL WAGONS—*Railway (English) Press*: A new departure in wagon-building is being effected at the Leeds Forge, where machinery, presses and appliances are being put down with a view to manufacturing railway wagons from one piece of metal—iron or steel—that is, the wagon itself outside the wheels, axles, springs, etc. The wagons are to be made by means of a press and dies, and in a comparatively short time, from a heated plate, the sides and bottom of a wagon can be formed. There will be no need of angle iron or steel, or of riveting. Experiments have already been carried out with mild steel, which have proved there is no difficulty in properly stamping out these wagons without making bad corners. In fact the whole wagon, when finished, seems to be one compact and solid piece of metal without flaw or crack to be seen anywhere, and it is evident no great strain or tension is caused by the manner in which the plate is treated in the process. These wagons will be comparatively cheap, so far as cost of manufacture is concerned, and they will certainly be very strong and durable, and when made as is proposed, of light, strong steel, will be comparatively light from a haulage point of view. The Leeds Forge Company may look forward to a good trade in this new departure of theirs in wagon-building.

IRON AND STEEL IN SHIPBUILDING.—How well plates of iron and steel withstand the contact with rocks, when exposed in a ship's bottom to violent collision, is shown in a forcible manner by the experience of the mammoth steamer Puritan of the Fall River line. After running ashore in the East river, she was taken into drydock. On her port side was a huge groove where the steel plates had been crushed in. The Puritan had struck the rock about 100 feet from her bow, and her momentum had forced her along over the obstruction. After about 110 feet of her plates had ground along over the rock, the steamer slipped off the reef. The damage to the hull had ended about 30 feet forward of the paddle-wheel. The effects of the contest of stone and steel presented a curious sight. The groove was almost smooth in places, the hull being merely bent in, but every few feet the metal had been torn open and jagged holes made. A number of plates

and a good many frames had to be replaced. The officers of the company regarded the accident as merely furnishing proof of the superior strength and stanchness of steel over iron in shipbuilding.

A FINELY-POLISHED, lusterless surface on tempered steel can be produced by either of the following operations: After the steel article shall have been tempered, it should be rubbed on a smooth iron surface with some pulverized oil-stone until perfectly smooth and even, then laid upon a sheet of white paper and rubbed back and forth until it shall have acquired a fine, dead polish. Any screw holes or depressions in the steel must be cleaned and polished beforehand with a piece of wood and oil-stone. This delicate, lusterless surface is quite sensitive, and should be rinsed with pure soft water only. A more durable polish can be obtained by first smoothing the steel surface with an iron polisher and some powdered oil-stone, carefully washing and rinsing. Then mix in a small vessel some fresh oil and powdered oil-stone, dip into this mixture the end of a piece of elder pith, and polish the steel surface with a gentle pressure, cutting off the end of the pith as it shall commence to become soiled. In conclusion, it should be thoroughly cleaned in soft water, when the article will be found to have a fine, lusterless polish.—*Et.*

HOW TO DRESS AND TEMPER STONE TOOLS.—A correspondent of the *Blacksmith and Wheelwright* gives from his experience the following as the best way to do such work: The workman must first see that the tools are free from cracks and flaws, and drawn down to the proper size, and allow them to cool. Tip his anvil a little from him, and with patty go around the anvil and build up a little so as to form a box that will hold water. Three sides built up will hold all the water necessary. If you have Webber's recipe, take some of the tool solution and put a little on top of your anvil, heat the tools very red, and with a light hammer work the cutting part by hammering it in the solution you have on the anvil. Heat each tool twice and work as directed, in the solution, and allow all to cool. Put an old wagon-box skin into the fire, and on this get your tools dark and drive the cutting edges in a block of cold lead, and you will have tools that will never come back broken or bent.

SKILLFUL FIREMEN.—The duty of a fireman in an engine room is something to which too little attention is given. More money can be saved by an intelligent and thoroughly competent fireman than by any other workman in a large establishment. The following paragraph is one which may well be carefully considered in this connection: The *Industrial World* says that a large manufacturing firm, the name of which, however, it does not mention, has made a new departure with a view of securing greater economy in the consumption of coal. It has concluded to deal with the firemen instead of devices to secure economy, because no matter how ingenious the latter, they will not avail if the firemen use the coal carelessly. The firm is therefore training their firemen to use fuel to the most advantage. The men who save the most fuel are to be rewarded and those who do not prove expert are to be replaced by others.

By a NEW METHOD of cementing iron the parts cemented are so effectually joined as to resist the blows even of a sledge-hammer. The cement is composed of equal parts of sulphur and white lead, with a proportion of about one-sixth of borax. When the composition is to be applied it is wet with strong sulphuric acid and a thin layer of it is placed between the two pieces of iron, which are at once pressed together. In five days it will be perfectly dry, all traces of the cement having vanished, and the work having every appearance of welding.

ROLLED STEEL CARRIAGE-WHEELS are a recent article of manufacture in Pennsylvania, which proposes to furnish a large portion of the 10,000,000 carriage and buggy wheels made in this country every year. In this connection the company makes a cold rolled steel tube, from open hearth, Bessemer or crucible steel, intended to take the place of brass, copper or tin tubes for chandelier work, railings and curtain-rods. The tubes are rolled by a process which gives them various superior qualities in increased strength, both tensile and compressive.

A LOCOMOTIVE working under a pressure of 140 to 165 pounds to the square inch, may move a railway train at a velocity of 60 miles per hour, which we are apt to think of as a wonderful speed. But it is slow compared with the rate of motion of the projectile from a modern great gun. Such projectiles flies at the rate of 1365 miles per hour, impelled by a pressure of 35,000 to 40,000 pounds per square inch.

ELECTRIC WELDING.—In some experiments lately made in England to test the merit of electric welding, a $\frac{1}{4}$ -inch iron bar was welded by means of electricity and one by hand. The former stood a strain of 91.9 per cent of the metal itself, and the latter 80.3 per cent. The electric weld, however, showed cracks when bent cold at an angle of 66°, whereas the hand-made joint stood 138° on the bend.

SCIENTIFIC PROGRESS.

Recent Electrical Discoveries.

New and interesting scientific facts in regard to electricity are constantly being evolved by students and experimenters in that fruitful field of research. Among those quite recently announced are the following:

Variations in Length of the Electric Arc.

A great variation in the length of the electric arc obtained in different gaseous atmospheres has been noticed by M. Villari. With horizontal carbons the electro-motive force that gave an arc one-sixth of an inch long in hydrogen produced one of five-sixteenths of an inch in oxygen, and one of one-third of an inch in ordinary air. With vertical carbons, especially with the negative uppermost, the length is greatly increased, and the same electro-motive force gave an arc 27.5 times as long in oxygen as in hydrogen.

Improvement in Arc Luminosity.

A method by which the luminosity of the arc light may be greatly increased is announced. The principle on which this improvement is based is that of reinforcing the luminous particles of incandescent carbon in the electric arc by a supply of hydrocarbon vapor. This is fed directly into the arc from the hollow lower carbon, fitted with a reservoir of oil and a wick. The effect of the added volume of vapor is said to be an enormous increase in the luminosity of the arc, and consequently, a most brilliant and economical light. The hydrocarbon employed is very cheap, and the hollow carbon entails a very slight extra expense; but the efficiency of the arc in watts per candle is said to be nearly doubled. The color of the arc is changed by the enriching medium to a clear yellowish white, quite different from the usual bluish glare.

Effect of the Sun's Rays upon an Insulated Conductor.

In the course of four years of experimenting, M. Albert Nodon has established the fact that when the sun's rays fall upon an insulated conductor, metal or carbon, they communicate thereto a positive electric charge, which increases with the intensity of radiations and decreases with the hygrometric state of the air. At Paris the electrification is greatest at about 1 P. M., when the air is clear and dry, but it disappears on the passage of clouds near the sun. The experiments indicate the source, or at least one source, of atmospheric electricity, as it may be assumed that the surface of the earth becomes positively electrified, while the heated air rises with a negative charge which it imparts to the clouds.

The Possible Causes of Increased Electrical Phenomena.

It is more than possible that the above hypothesis may furnish an explanation for the recent apparent increase of thunder-storm phenomena, including the frequency of such storms over forests, rivers, lakes, etc., where the cooler air causes the electrified clouds to fall toward the earth until a discharge takes place.

Electricity Direct from Coal.

In another column will be found a full notice of a discovery, just reported, of a method by which electricity may be obtained directly from the burning of coal—thus realizing at the present day the dream of the last fifty years of what has been thought a possibility to be looked for by some future generation.

LIGHT OF THE FIREFLY.—The nature and source of the light given out by this nocturnal insect has long been a puzzle to scientists. Prof. S. P. Langley of New York has lately been investigating this question, largely by the use of the spectroscopic. He finds the light is substantially from the green side of the spectrum. It is of exceedingly narrow range of refrangibility, extending only from F to C, and culminating in the green, so that it contains no appreciable heat. The amount of heat yielded, as measured with Prof. Langley's wonderfully delicate "holoscope," is less than one-half of one per cent of that given out with an equal amount of light from the candle and other common combustible illuminants. That the light produced by the firefly is a chemical product would seem to be indicated by the fact, established by Prof. Langley, that it decreased by the processes which check combustion and increased by the opposite, that nitrogen quenches it and oxygen stimulates it, while the product of the operation, whatever it may prove to be, is apparently carbon dioxide. It may prove, however, so far as can be judged at present, that these effects are simply those of variation of the vital powers and a resulting variation in intensity of the light.

A NEW AND CHEAPER LIGHT has just been announced. The invention is the result of the study of W. J. Norton of Pittsburgh, Pa., which, without being less lustrous than any light in vogue, is perfectly free from those features so destructive to both life and property that have for years characterized the use of gas, electricity and kerosene oil. It can be furnished so cheaply as to be available to all classes. While it now costs the city of New York \$150,000 per annum for its electrical street light alone, and \$30,000 more is demand-

ed, it is claimed that the same amount of light can be furnished by the new process for about \$60,000 per annum. Another recommendatory feature is the inexpensive adaptation of this intense and brilliant illuminator, as the production and the distribution of this light appear to partake of almost incredible simplicity. This invention comes from the great storehouse of chemistry, from whose rich resources will probably one day be revealed the means of extinguishing our fires with the same celerity as we illuminate our dwellings.

BREAD FROM WOOD.—A startling proposition has been made by Herr Victor Meyer. In an address recently delivered by him at Heidelberg, it is announced that we may reasonably hope that chemistry will teach us to make the fiber of wood the source of human food. If this becomes possible, an enormous stock of food will be found in the wood of our forests, or even in grass and straw. The fiber of wood consists essentially of cellulose ($C_6H_{10}O_5$)_n. Can this be made to change into starch? Starch has exactly the same percentage composition, but it differs very much in its properties, and the nature of its molecule is probably much more complex. Cellulose is of little or no dietetic value, and it is not altered, like starch, in boiling water. It really gives glucose when treated with strong sulphuric acid, as is easily shown when cotton-wool, which is practically pure cellulose, is merely immersed in it. Starch gives the same product when hoiled with weak acid. The author further quotes the researches of Hellriegel, which go to show beyond dispute that certain plants transform atmospheric nitrogen into albumen, and that this process can be improved by suitable treatment. The production, therefore, of starch from cellulose, together with the enforced increase of albumen in plants, would, he adds, in reality signify the abolition of the bread question.

ANOTHER BIG TELESCOPE.—The study of astronomy is becoming more and more a matter of general interest everywhere, while those who make it an especial study are constantly adding instruments and means to increase the possibilities of their researches into the great mysteries of the worlds around us. Just now, much is being done in the construction of telescopes of increased magnitude and improved powers of penetration. The great Lick instrument and the proposed larger one for Los Angeles, will probably soon be exceeded by one to be erected at Ealing, in England, which, reports says, has just been made single handed by Mr. Common, the astronomer. Its whole mass weighs nearly 20 tons. The enormous cylinder which forms the tube is 20 feet long and eight feet in diameter, resembling the ordinary boiler of a stationary engine. Inside this is delicately distributed some ten tons of pig iron, the whole instrument going to form the most wonderful instrument which the planet possesses. Through Mr. Common's telescope it will be easy to see no fewer than 50,000,000 stars.

PRODUCTION OF HEAT IN LIVING BODIES.—M. M. Berthelot has been making investigations in regard to the heat of combustion of the principal nitrogen compounds contained in living bodies and their results in the production of animal heat. The data and results are given for 16 nitrogenous bodies. The average heat of combustion is 9400 cal. for fatty bodies, 5700 cal. for albuminoids, and 4200 cal. for carbohydrates, taking one gram of each substance. The conclusion is drawn that a weakening of the organism, with diminution of power of consumption of the food digested, shows itself first by general deposition of the most difficultly eliminated substances—fatty matters, then by failure to get rid of nitrogenous bodies, and finally by incapacity to consume the carbohydrates.

VIBRATIONS IN BUILDINGS.—The danger and inconvenience resulting from the vibrations in buildings caused by running machinery can be to a large degree removed by increasing the speed of the engine, the idea being to set up a discordant vibration between the engine and the floor beam. The Pittsburgh Dispatch tells of a ten-horse power engine, which, on the upper story of a silverware manufactory, created such a commotion as to rattle the silverware on the shelves a hundred feet distant. A change of 25 revolutions in the speed, which change was in the direction of increasing the speed, entirely stopped the vibrations.

A NEW LAW, POSSIBLY.—In recent experiments, alloys have been formed by pressure, but William Hallcock, of the United States Geological Survey, finds that alloys may be produced from their powdered constituents without pressure at a temperature above the melting point of the alloy but below that of the constituents, the molecules simply being allowed to lie in contact. In this curious discovery he claims a new law of physics, which he proposes soon to verify further.

WOOL FIBERS.—A student at the Institute of Technology, Boston, has been experimenting for some purpose or other upon the several characteristics of the wool fiber. Twenty-two tests on domestic and Australian wools resulted in an average diameter of 2.389 centi-millimeters, an average stretch of 41.22 per cent, and a breaking strength of 23,822 pounds per square inch.

GOOD HEALTH.

Health of the State.

The monthly report of the State Board of Health for May furnishes reports from 103 cities and towns, with an estimated population of 766,625, giving the number of deaths as 1022, or the rate of 15.96 per 1000 per annum, which is a slight increase over last month. The principal causes of death are to be found among the diseases of the lungs and heart.

Consumption caused 164 deaths; pneumonia 97, seventy of which occurred in San Francisco—a marked diminution in the frequency of the disease. Whooping-cough was the cause of four deaths. Cancer was fatal to 44 persons. Heart disease caused 84 deaths. Alcoholism caused eight deaths.

Prevailing Diseases.

Whooping-cough has been almost epidemic in one or two localities. The weather for the month of May being quite favorable to those suffering from diseases of the respiratory organs, a marked decrease was noted in the prevalence of pneumonia, bronchitis and influenza, while on the other hand an increased prevalence was noted in the frequency of bowel and stomach disorders.

Smallpox.

No cases of this disease were reported in California. Dr. S. S. Herrick, the Medical Inspector appointed by the board to investigate the towns near the southern border of the State, reported to be the seat of smallpox, finds upon personal examination that the account received by the State Board of Health was very much exaggerated. He discovered no cases along the route of the Southern Pacific railway, but found that there was smallpox in Las Cruces and other contiguous villages in New Mexico, but none so close to railway travel as to seriously threaten us at present. Every precaution has been taken to prevent the spread of the disease into California, and it is to be hoped our efforts will be successful in this respect.

SILK UNDERWEAR.—R. fixed women in private life, says the New York Tribune, have never adopted the stage fashion of wearing a complete outfit of underwear made of white or colored sarah, or India "wash" silk. These materials, though washable, are unfit for use, because they cannot be sun-dried in the fresh, open air without losing color. The superiority of even a cambric handkerchief to a silk one need not be dwelt upon where any one has made use of both. The silk undergarment worn by most refined city women is an undervest of silk webbing. This garment must be made of the purest thread of silk in order to be a wholesome substitute for wool. There has been no method ever discovered which will prevent the spiral fibers of wool from drawing up in lanndering. With the most scrupulous care such garments are shrunk up, unfit for wear, long before they are worn out. Silk undervests of the purest quality are an expensive item at first, but will outlast several sets of wool underwear, and in the end pay for themselves.

IMMUNITY AGAINST POISON IVY.—There is a large number of persons who will take an interest in the statement that an immunity against this plant can be secured. At least it has been done in one instance, related by Dr. John Aulde in the New York Medical Journal. He says that Dr. George Kirkpatrick, of La Harpe, Ill., took by mistake a good swallow of the tincture (of poison ivy?), and in order to counteract the effect of the poison, large doses of olive oil were administered, and along with it about ten grains of carbonate of sodium. No immediate unpleasant effects were observed until the second day thereafter, when it was found that there was complete derangement of the cuticle, and since that time he is proof against the poison of the plant.

A CURIOUS DISEASE.—Galveston doctors have a patient on exhibition, a colored man who is afflicted with filaria. In other words, there was a little animal in his blood, usually found in the blood of dogs. The blood was placed under the microscope, where the little animals could be plainly seen. They were about 1-50 of an inch long and 1-3000 of an inch thick, and transparent. They are said to be transplanted from dogs to men through mosquito bites and even flea bites.

CARRY THE BABIES RIGHT.—A French physician, Dr. Feltz, mentions a curious apparent case of left-handedness. One child in a certain family was left-handed, and a second appeared to be so at the age of one year. It was then learned that the mother always carried her children on her left arm. She was advised to change, and, held on the other arm, the infant, having its right hand free to grasp objects, soon became right-handed.

THE ORDER IN WHICH TEETH DECAY.—Russian observations have shown that teeth decay in a quite regular order, the lower third molar being the first attacked, then the upper, then the lower fourth molar, and so on, the lower incisors and canine teeth being the last affected. Upper teeth, as a rule, are more durable than lower, right than left, those of dark persons than those of blonde, those of short persons than those of tall.

USEFUL INFORMATION.

TO DETECT DAMPNESS IN A WALL.—It is oftentimes important to detect the slightest dampness in a wall. To do so with care, the following course is recommended: Take a sheet of common gelatine, the thinnest pieces are selected; they are soaked in water for about a quarter of an hour, until they are quite soft, spread out flat on a greased sheet of glass, and stretched with the fingers until all the folds and creases that may exist are smoothed out and the whole is made thin and uniform as possible. The sheets are then dried in the air, rough or uneven edges trimmed off; then cut into strips about four inches long and two inches wide. If kept flat, in a dry place, these gelatine strips are very sensitive to moisture. If a wall is suspected of being damp, without showing it outwardly, a slip of gelatine is moved slowly over it near its surface, but without touching it. If any damp spots exist, they are indicated by the curling of the gelatine as it passes near them.

THE SIDE SADDLE DOOMED.—At last it would appear an effort is to be made to abolish the senseless side-saddle for women who wish to indulge in horseback riding. Miss Jenness, sister of Mrs. Jenness-Miller, the rising apostle of physical education for women and dress reform, is the leader of the movement. Side-saddles were introduced centuries ago by an English queen, with a short and deformed leg, who could ride in no other way. Such is the power and custom of fashion, that they have held full sway ever since. The side-saddle develops the muscles of one leg and one side of the body, to the neglect of the other side, but this is not the least of its offenses, for the peculiar position of the body while riding, encourages curvature of the spine. Abolish the side-saddle by all means.

MINERAL OR SLAG WOOL.—The use of mineral or slag wool is becoming very general as a filling for floors. It is also a protection against the spread of fire. The experiments conducted by H. H. Stanger, C. E., London, England, prove that a body of the slag or wool, say one inch thick, does not become incandescent when subjected to intense heat, only the parts in immediate contact with the flame being fused, leaving the rest intact; and even when heated through by long subjection to heat there was no radiance, a thermometer held within one-fourth of an inch not varying in the least. The Liverpool theaters have the drop-curtains lined with this material, and recently a patent has been obtained for weaving the slag wool into curtains for both theaters and other buildings.

ANOTHER SUBSTITUTE FOR SILK.—An alleged discovery of a silk-fiber substitute is reported in European circles. A London paper states as follows: Naysamra Sakasahuro, a druggist of Hikone in Omi, after many years of experiment and patient research, has succeeded in converting wild hemp (yachyo) into a substance possessing all the essential qualities of silk. Nothing is said about the process, but it is asserted that trial of the thread has been made at the first silk-weaving establishment in Kioto and other factories, with excellent results in every case. The plant in question grows wild on moors and hillsides. Its fiber is strong and glossy, in no wise inferior to silk when properly prepared. Cultivation on an extended scale would present no difficulties.

FLUID MARBLE.—The story of placing marble in a fluid condition is again set on foot, with the name of an Austrian sculptor, Friedrich Beer, as the inventor. He claims to be able to mold a particular kind of marble even as bronze is molded. The name of the marble thus treated is heryt. The new product costs little more than plaster, and is especially adapted to the ornamentation of houses and the construction of floors, baths, and small pillars. A stock company has been organized in Paris to place heryt on the market.

BRAKE WORK.—Frank J. Sprague states it as a well-known fact that the most effective brake work is when the wheels do not skid upon the track, but when they are turning under the pressure of the brake; and contrary to the ordinary braking practice, the energy of the electric train, instead of being thrown away in the form of heat, and using up the wheels and brakeshoes, can be made useful in the propulsion of other trains.

AN IMMENSE INDUSTRY is growing in the area of country bordering on and tributary to the Great Lakes. This area, now anxiously seeking the advantages of cheap transportation, exceeds 1,000,000 square miles. The coast line of the lakes is more than 2000 miles in extent. The floating property employed on the lakes is valued at about \$65,000,000.

INTERESTING EXPERIMENTS.—At the Phoenix Works at Ruhrort, Germany, experiments have been made, for some time past, in the use of carbon as a re-carbonizer in the place of ferromanganese or epiegelstein. Similar experiments have been conducted at the Brymho Basic Steel Works, Wales.

A HOUSE at South Fairfield, Mich., was set on fire by the rays of the sun, reflected from tin pane that were set out to dry.

ELECTRICITY.

Electricity Direct from Coal.

It is now asserted that the long-sought-for problem of obtaining electricity directly from the combustion of coal has actually been realized. Our technical exchanges from the East, which are in a position to best judge of the reliability of the claim, appear to receive the announcement with every evidence of their fullest belief in its reality.

The successful inventor is Mr. H. R. Cox of Maine. The conversion of heat directly into electricity without the intervention of steam boilers, engine, or dynamo, if successful on a large scale, will be of enormous value and will work a complete revolution in the industries of the world.

As yet the invention has been tried on a small scale only; but those experiments have been so successful and convincing that some of the shrewdest capitalists and mechanicians in New England have united and formed a company with a capital of \$1,000,000 to put the discovery into practical operation. A company was first organized in Maine, but the business has since been transferred to Hartford, Conn. Francis A. Pratt of the Pratt & Whitney Co. is the president of the company; R. N. Pratt of the Pratt & Cady Co. is vice-president, and Ernest Cady of the same company is the treasurer. E. Henry Hyde of Hyde & Joslyn is a stockholder, one of the directors and legal adviser of the new company. All the patents asked for by Mr. Cox have been allowed. Both foreign and domestic patents have been applied for.

The Hartford Courant says: The apparatus used for converting the heat into electricity is so simple that the company does not dignify it by the name of machine. By Mr. Cox's method, heat is changed to electricity as simply as water is changed to steam. His furnace is all that may be seen. From glowing coals comes the subtle current, without the aid of boiler, engine or dynamo, which can be made to run a dental machine, a sewing machine, and anything which requires no more power than these. No power has ever been discovered that is half so cheap as will be electricity obtained by this new process. This has been the dream—apparently impossible of realization—of all electricians, and even the Wizard of Menlo Park has almost despaired of its ever being brought about. Yet a young man, only 23 years of age, seems to have solved the puzzling problem.

Before the company was formed, Mr. Cox had a furnace at his house by which he ran many electric lights. This furnace was injured in being transferred to Hartford, and a new one of the same size has not yet been completed. Experiments and private exhibitions have been conducted here on a smaller scale, but in a short time the company intends to show to the world that with the power thus obtained anything that steam or electricity now does may be done. Several members of the company saw what could be done with the furnace of Mr. Cox before any attempt was made to remove it. The one now being built will be an improvement on the old one, and the results from it are expected to be correspondingly better. Most of the stock of the company is owned in Hartford. Some of it is held in Boston. The whole affair has been kept secret until the company should be ready to make it public. Even now the officers are unwilling to talk for publication, but gossip about the new invention has been so frequent in Hartford and elsewhere that it seems proper to print a general statement. The officers of the company say they will be ready for public exhibitions in a few weeks.

ELECTRIC LIGHT FROM GAS ENGINES.—A highly interesting fact has been brought out by Mr. O. Tirrill of New York, in some practical tests in producing electric light by using illuminating gas for driving a gas engine and a Perret dynamo. Naturally, one would suppose that the loss due to the double transformation of energy in producing the electric light from illuminating gas by this means would place the cost of the electric light far above that of gas. On the contrary, Mr. Tirrill has found to his surprise that a given amount of gas will produce far greater illuminating effects when used to drive this dynamo than when burned direct. The gasoline gas is produced by his machine for one dollar per thousand feet. The engine, it is found, consumes four feet of this gas per 16-candle power lamp per hour when driving the dynamo under full load, making the cost per lamp two-fifths of a cent per hour, so that the luxury of the electric light by this means, instead of being expensive, he finds in reality to be a great economy. Mr. Tirrill explains the phenomenon by the fact that the gasoline gas contains 80 per cent of air when delivered at the explosion chamber of the engine, and he gets the benefit of the expansion of this large volume of air by the heat of the explosion.

ELECTRIC LIGHTING AND POWER have made wonderful and monstrous strides in popularity, considering the youth of their existence, and they will continue, despite every opposition, to grow in grace and strength, till they have relegated to the rear ranks every other form of illumination, and crowded the present clumsy, hot, ungainly engines from their vantage ground, as the circe elephant clears the tank-hark plug for the rider. —C. C. Haskins.

An exchange says that on the occasion of an accident on the Buda-Pesth electric railway, in which a woman was knocked down by an approaching tram, caught by the wheels, and mangled, a number of people who witnessed the occurrence made an attempt to lynch the engine-driver and conductor.

SHOP NOTES.

Shop Suggestions.

If you take off a pulley and put on another one an inch smaller in diameter, how much should be taken out of the belt to make it run as tight as before? About an inch and a half, or once and a half the difference in the diameter of the two wheels, nearly.

An improvement has been patented in wire ropes by having two cores side by side, which gives the rope an elliptical form in cross-section. Now, why doesn't some one take the hint and place three wire ropes side by side and use them for a core in rope-driving? If they would, the next step will be to take six and make a belt of them.

A belt-maker has just been called upon to look at a belt that was supposed to be belted. The pulleys were true and in line and the shafts were parallel, yet the belt stood over on the same side and hung off as far as possible, no matter which side out it was run. An inspection soon showed that there was trouble with the shaft wheel on account of its being keyed on one side, leaving the other loose, which soon wore out large enough to let the belt draw the wheel to one side.

It was quite an improvement in loose pulleys when they first came about to have the loose wheel some two inches smaller in diameter than the other, a cone flange being left on the loose wheel for the belt to run upon to get on to the fast pulley. Since then they have been tried all ways, one huller using three wheels, the third to carry the cone sleeve reaching from the loose to the fast wheel. The instant the belt is shifted it will run of its own accord to the highest position and set the machinery in motion.

Be careful in turning up gear blanks, unless the man at the gear cutter works from the pitch line instead of the outside diameter of the wheel, for if the blank is left too small the teeth become thinner than they ought, and if too large the teeth will be made thick by the operation.

Among the change-gears that are found with a lathe, there are always two that are of the same size to be used whenever cutting threads of the same pitch as that of the leading screw. Anything finer than this will have the large gear on the screw, and all threads of a coarser pitch will have the smaller of the required pair on the leading screw.

A large hall was wanted, and a block of wood, nearly square on all sides, was brought in for the lathe man to test his skill upon. He just held it by the face plate assisted by the tail center, in hopes of turning it off into a cylindrical form endways with the grain. This he accomplished with ease, and all he then had to do was to hold it between centers in line with the grain when it was easily finished by hand, as a cylinder held in this form gives a perfect sphere while in motion with the grain in the best condition to turn smooth.

Jodglog from what may be seen in a dusty machine shop, a man must have the outfit of a diver to keep his lungs in working order. Already some one has patented a hood supplied with a hose from a blower to be thrown over the head of the glider when he has a job at the emery-wheel. The hood is supplied with a pair of opera glasses to see through, and must be a great assistance when a fine edge is wanted for a lathe tool. This, together with the sponge at the polishers', and blue glasses where an arc light must be endured, ought to set aside anything that a diver has to go through.

Flesh or Hair Side to Pulley?

Any one ever having had anything to do with the running of belts knows that the smooth side of a belt has more friction than the rough side. If more friction, then more power. If a belt on a machine, rough side to the pulley, is thrown off and turned smooth side to the pulley, it will be found that the speed is faster than by the rough side. Try it. A smooth, brightly polished faced pulley gives more friction than one that is rough; and yet how many machinists have taken a file to rough up the face of a pulley to make it "bug." One engineer says the flesh side should go next the pulley, because it is smoother and has less air pockets. The flesh side is less liable to crack on the outer circle. Air is elastic, too.

Some one has put the whole business into a poetic form as follows:

Belting has an outside hair side,
And it has an inside flesh side,
Of the question rises, Which side
Is the side that should run inside;
Which the side that should run outside?
Some aver the inside flesh side
Is the side that should run outside;
Others say it should run inside.
Some are sure the outside hair side
Is the side that should run inside;
Others say it should run outside.
Ample is the proof on each side,
Wonder which side is the right side,
My poor head, 'twixt this and that side,
Seems to be quite inside outside.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Cables for Cable Roads, 427. Screen Tanks, 435.

EDITORIALS.—Cables for Cable Roads, 427. Passing Events; Close of Volume LX; Silver Legislation; James' Traction Engine; The Molders' Strike; Cone Scales for Saving Gold, 434.

CORRESPONDENCE.—Mines Around Glendale, Montana; The Mines of Amador County; The Gold Belt of Northern California, 428.

MISCELLANEOUS.—Water on the Pacific Coast, 429.

MECHANICAL PROGRESS.—Tools from Soft Steel; Steel Wagons; Iron and Steel in Shipbuilding; How to Dress and Temper Stone Tools; Skillful Firemen; Miscellaneous, 432.

SCIENTIFIC PROGRESS.—Recent Electrical Discoveries; Light of the Firefly; Bread from Wood; Another Big Telescope; Production of Heat in Living Bodies; Vibrations in Buildings; A New Law, Possibly; Wool Fibers; Miscellaneous, 432.

GOOD HEALTH.—Health of the State; Silk Underwear; Immunity Against Poison Ivy; A Curious Disease; Carry the Balance Right; The Order in which Teeth Decay, 433.

USEFUL INFORMATION.—To Detect Dampness in a Wall; The Side-Saddle Dismount; Mineral or Slag Wool; Another Substitute for Silk; Fluid Marble; Brake Work; Miscellaneous, 433.

ELECTRICITY.—Electricity Direct from Coal; Electric Light from Gas Engines; Miscellaneous, 433.

SHOP NOTES.—Shop Suggestions; Flesh or Hair Sled to Pulley, 433.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 430-431.

MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 440.

MARKET REPORTS.—Local Markets, Eastern Metal Markets, 440.

Business Announcements.

[NEW THIS WEEK.]

Passing Events.

This number of the PRESS closes the volume, and it is hoped our readers will call the attention of others to the merits of the paper just at this time in order that new subscribers may commence with the next volume.

The shooting of one of the striking molders by one of the proprietors of a foundry has brought the phase of violence into the contest in this city, as has been long feared.

At last, Congress has done something definite on the silver question, by the House refusing to adopt the amended Free Coinage bill. This matter is referred to more fully in another column.

The mining outlook is quite favorable in this State, and in fact all over the coast. The miners are busy everywhere, and there is an abundance of water in all the streams for power.

Prospecting for natural gas is going on in many places in this State. Within a week a fine gas-well is reported in Santa Barbara county. In San Joaquin county there are several of these wells and doubtless others will be found.

The 9th of September is already a legal holiday in this State, and this year the Governor has declared the 8th also a legal holiday, so that there will be plenty of time to properly celebrate the anniversary of the admission of California into the Union.

Close of Volume LX.

Volume LX of the MINING AND SCIENTIFIC PRESS closes with this number. The PRESS is now the oldest journal devoted to mining in the United States. When it first began its work as the representative of this industry, the field of preclon-metal mining in this country was comparatively small and confined to few regions. Now, however, there are numerous districts and camps in all the Western States and Territories, many of which have assumed very great importance. With this advance in importance of the mining industry, the PRESS has endeavored to keep pace, and its field has widened in due proportion. During all these years, in addition to current mining news, the metallurgical processes, improvements in apparatus and machinery, etc., have been described and their value or utility commented upon. The files of the PRESS will be found to contain a complete record of matters relating to mines for the whole Pacific Coast.

The carefully prepared index on the last page of this number shows the variety and scope of the contents of the volume and the general character of the subject-matter published. While devoted to mining mainly, space is also devoted to popular science, mechanical and scientific progress, engineering and industrial pursuits, and inventions receive a liberal share of attention. More space has been devoted of late to illustrations and this feature will be still more fully cared for in the future.

Mining men and the progressive industrial classes of this coast cannot well afford to be without the MINING AND SCIENTIFIC PRESS, which is devoted to their interests. Those familiar with its merits should call the attention of others to the paper and aid us in increasing our list of subscribers.

Silver Legislation.

The action of the House in rejecting the Senate's free coinage amendment, and asking for a conference on the Silver bill, is taken to indicate that a compromise bill fairly satisfactory to bimetalists will be agreed upon. While bimetalists will gracefully accept the best bill obtainable, yet they will appeal to the public at the Congressional elections to be held this fall, in favor of the free coinage of silver. There are too many industries whose general prosperity is dependent upon silver being placed on a par with gold, to allow the metal to continue a commodity, and free coinage alone can raise it from that debased position.

Judging from the tenor of press and private advice received from Washington, it looks at this writing that the bill upon which the Conference Committee will agree will include the original features of the House bill making it compulsory to purchase 4,500,000 ounces of silver monthly, with the bullion redemption clause stricken out, and making silver certificates a legal tender and redeemable in lawful money of the United States.

According to latest authentic advice, the production of silver by the civilized nations aggregates 130,000,000 ounces a year. Of this there is used in the arts 20,000,000 ounces. India takes 30,000,000, China, Japan and the East 10,000,000, while European and other countries outside of America take for coinage 20,000,000. Total, 80,000,000 ounces. With the United States purchasing for coinage 4,500,000 ounces monthly (54,000,000 yearly), the surplus will be more than absorbed. It also stands to reason that with the latter country using so large a quantity, the price of the metal will be largely enhanced, which will force other nations to use more silver, so as to bring their yearly coinage up to the usual output. With such a condition of affairs bimetalists ought to be able to produce a change of sentiment abroad toward silver and bring about the remonetizing of silver.

A NATURAL GAS WELL.—A correspondent writes us from Carpinteria, Santa Barbara Co., that a roaring natural gas well was struck one day last week by H. L. Williams of Summerland, at a depth of only 30 feet. The well shoots up a flame of fire when lighted from 10 to 20 feet high and at night lights up the whole town. There is probably more gas escaping from the two-inch pipe which is sunk but 25 feet than is manufactured in Santa Barbara, a city of 10,000 inhabitants.

Cone Scales for Saving Gold.

Charles Trafton of Yankee Jim's, Placer county, has just patented through the MINING AND SCIENTIFIC PRESS Patent Agency a new gold-saving apparatus, the main feature of which consists in the novel concentrating or gold-catching surface.

He makes a frame or table of any suitable character, over the surface of which are secured the scales of the cones of the coniferous order. For some work—as, for instance, for coarser material—he prefers to use the scales of the larger cones, such as ara borne by the "digger" and the sugar pine. For lighter work he uses the scales of smaller cones, as of the spruce, and in some instances the scales of the cones of the fir and hemlock. These scales are closely set over the surface of the frame or table, somewhat after the manner of shingles, though not necessarily in the regular rows or lines of shingles, but in such a way as to fully cover the frame or table surface, the scales overlapping each other. They may be secured upon a perfectly plane surface, or upon a surface formed with inlines.

In either case—on account of the peculiar shape of the scales—they do not lie flat and close upon one another, as do shingles, but their free points or ends are separated from the bodies of the scales which they overlap, and especially is this separation noticeable where the scales are set to break joints, as it were, in succeeding rows, because of the lateral convexity of the scale, a space being left between the points of the overlapping scales and the meeting edges of the underlying scales. This separation is more noticeable, however, in the form where the scales are attached to inclines. The surface thus provided is a very rough one, having deep interstices and spaces.

The utility of the surface for the purpose intended lies in this fact to a great extent, as the heavier particles are caught in the interstices or spaces between the scales, which thus form riffles, while the lighter particles are washed off, it being understood that the table or frame is a washing-table, and water is to be used in connection with the ore. The water and ore flow over the surface in a direction against the raised or free ends of the scales.

The table or frame is intended to be one of a series of similar tables or frames to be placed in the sluice; but it is obvious that the same surface may be made within a properly or differently constructed frame, having sides sufficiently high to form a channel for itself. The utility of this surface is not confined, however, to its roughness, but is due also to a peculiarity of the scale which develops itself after wear.

The upper or outer surface of the scale has a skin, which, upon exposure, or by reason of friction and wear, breaks off in scaly bits, leaving underneath a fibrous kind of body, which serves excellently as a concentrating surface on account of its roughness. It is, therefore, a fact that after the scales have been in use for a time, the skins peel off and wear away, leaving this fibrous or roughened surface of the scale exposed, and the whole surface is thereby rendered more effective than it was at first. Mr. Trafton says he has found by actual experience that this form of concentrating or catching surface is very effective. It is, moreover, simple and economical in its construction, and it is practical in its operation. The surface may be readily washed and cleaned when desired. The scales may be stripped from the table and washed, and then by burning them, all material which still clings to them after the washing may be saved.

The scales will last several months of constant use, and when worn out, or when destroyed for the purpose of saving the precious material which they have caught, others may be readily substituted.

WANT TO REMOVE THEIR PLANT.—The Eureka Lake and Mining Co., which carried on hydraulic mining several years ago at Columbia Hill, have made application to Judge Keyser at Marysville to be permitted to remove 4000 feet of flume and clean up the sluice, as large quantities of gold and quicksilver were deposited, from which it is expected \$15,000 will be realized. In the application it is claimed that the removing of the flume would prevent the greater portion of 100,000 yards of debris being emptied every winter into the Yuba river.

R. McMurtry said the company had no intention to violate the law, as it had ceased mining, and asked permission to make money and protect the valley. The motion was granted with the understanding that the work is to be done under the inspection of the anti-debris officers and at the risk of the company in violating the injunction already in force against the mine.

The Molders' Strike.

On Thursday morning of this week, the molders' strike, which has lasted nearly four months, at length brought about a homicide. Edward Coogan, an apprentice molder employed in the Vulcan Iron Works, was shot and killed by James W. Kerr of the firm of Steiger & Kerr, Occidental Foundry. It seems that a man named Claussen, employed in Mr. Kerr's foundry, and one of the few who did not go on strike, told Mr. Kerr he was threatened with molestation unless he quit work at the shop. Mr. Kerr accompanied him to his home on Wednesday night and went there again Thursday morning to bring him back to the foundry. They walked together and along the way there was considerable demonstration among the apprentices and other young men on the street. As the two came near First and Minna streets, a crowd of men surrounded them, and Mr. Kerr warned them to let him and his charge alone. The strikers surrounded Claussen and threw him down and injured him more or less. They are said also to have struck Mr. Kerr, who drew his revolver, fired and killed young Coogan.

There are, as is usual in such cases, conflicting statements as to Coogan's part in the affair, and the striking molders will not acknowledge that any of their men were engaged in the matter. Mr. Kerr declines for the present to make any statement.

The unfortunate affair is greatly to be regretted. It has created great excitement in the iron-works quarter and intensified the feeling between the men and their former employers. Until this occasion there has been no bloodshed in the contest, although it has been feared, and the men who are at work had armed themselves in anticipation of molestation.

While the general public and the foundrymen concede the right of the men to strike and quit work if they choose, they do not concede any right to prevent others from working in their places, and when such men are at work, it is very poor policy for the strikers to threaten or molest them. In such a course they get no sympathy. In this particular case they appear to have molested both a workman and an employer, under circumstances when they could do no less than defend themselves as best they could. The affair will of course be investigated by the authorities at once.

Prospecting in Alaska.

Whoever finds any gold in Alaska deserves all there is in it. There is doubtless plenty of gold there, but the conditions are not very favorable. The intense cold in winter and heat and mosquitoes in summer are not conducive to comfort or good work. In that region, which is thickly wooded and watered, there is no wandering about the hills, as with us, looking for "float," but they float about themselves do the prospectors, substituting a boat for a burro, and it is generally harder work to urge a boat than a burro. There is more work and less profanity required.

Rivers wind about the region in all directions. Upon these the prospectors launch their canoes and cover their distances, landing when and where they can to look after the golden scales. There are many marshes and moss-covered bogs to cross and thick timber which must be passed for all who go on foot. As a result, canoes are in demand and universally used. To go anywhere, the men must go by water. Although the following item would sound queerly anywhere else, it is all right when quoted from the *Alaskan Free Press*: "Quite a number of boats have left Juneau this week with prospecting parties and men going to various localities to commence development work on mining claims. During the warm weather of the past week the snow has disappeared as if by magic, and it will not be long until the hills are full of prospectors."

Mining Stockholders' Rights.

The present system of working some of the mining properties located on the Comstock lode in Nevada, is unparalleled for waste and extravagance. Extravagance may not be the strongest word to use when commenting upon the acts of trustees, in whose hands the property of a million people is placed in trust, for the reason that an eminent, judicial writer once said: A public trust is one of the most sacred things of our republican institution; to abuse a public trust is the greatest of crimes.

Such opinions should suggest a very careful reading of the law governing trusteeship by those who assume control of the property of their fellow-citizens, and the penalties imposed for non-compliance with the provisions of such laws should be studiously considered. Even a

ports of the Comstock mines, dating back to 1874, '75, '76, will be found, recorded, the fact that the mills were required to return not less than 65 per cent of the mine assays.

Those bullion reports, as well as all contracts of that date, whether written or verbal, taken in conjunction with the late refusal of the superintendents to return the amount of ore shipped to mill and the assay value thereof, leaves it open for the stockholder to imagine a fraudulent concealment on the part of the management.

The Mill Company, receiving ore from the mines that have not been weighed nor assayed, or, if so disposed, appropriate 50 per cent of its valuable bullion. Who is responsible? The Act of April, 1880, imposes a fine upon the trustees for this criminal neglect of property managed by them for all stockholders. Why is not this law enforced? A great majority of the presidents and trustees of the Comstock mines are wealthy citizens.

The real estate standing in their names and their monthly salaries in one case being \$1000 per month, should be sufficient guarantee that they are able and willing to pay fines if the

tached thereto. Being an agent merely, by what possible right can he claim the privilege of selling or even of giving the proxy power of his client to a third and disinterested party? This is all wrong and without legal authority. It is another of those improper customs which are allowed to grow, like rank weeds, until they nearly strangle all other products.

This abuse of the proxy system is very near the sap root of the unlawful system of mine management which has done so much to injure mining on our Pacific Coast.

It should be stopped, and the power to stop it rests wholly with the Mining Exchanges, whose members, without authority of law or consent of their clients, give the power to elect trustees, who, we are sorry to say, too often abuse the trust thus conferred upon them.

The mining interests of this coast amount to untold millions, and the individual members of our Mining Exchanges must be of very small mental caliber to tolerate a custom unknown to law when they have been convinced by their languishing business that the custom has been and is an abuse of their rights and the rights of those whom they are pleased to term clients.

ough investigation requested therefrom. A million stockholders are certainly entitled to property protection, and a petition forwarded in proper form to Washington would doubtless find plenty of advocates among our Representatives and Senators, who would demand an investigation by the General Government. This remedy has recently been suggested to many complaining stockholders in the hope that an investigation in the interest of truth and justice will be made.

Cables for Cable Roads.

(Continued from page 427.)

This is done by laying in the strands of the cable in the manner shown in the accompanying engraving, wires of a shape which allows them to lay in between the round wires and overlap them, so as to protect them against wear from abrasion.

In the engraving, Fig. 1, a longitudinal view of one strand of a cable is shown, and in Fig. 2 a section of the same strand, showing the manner of forming such strand, a center round

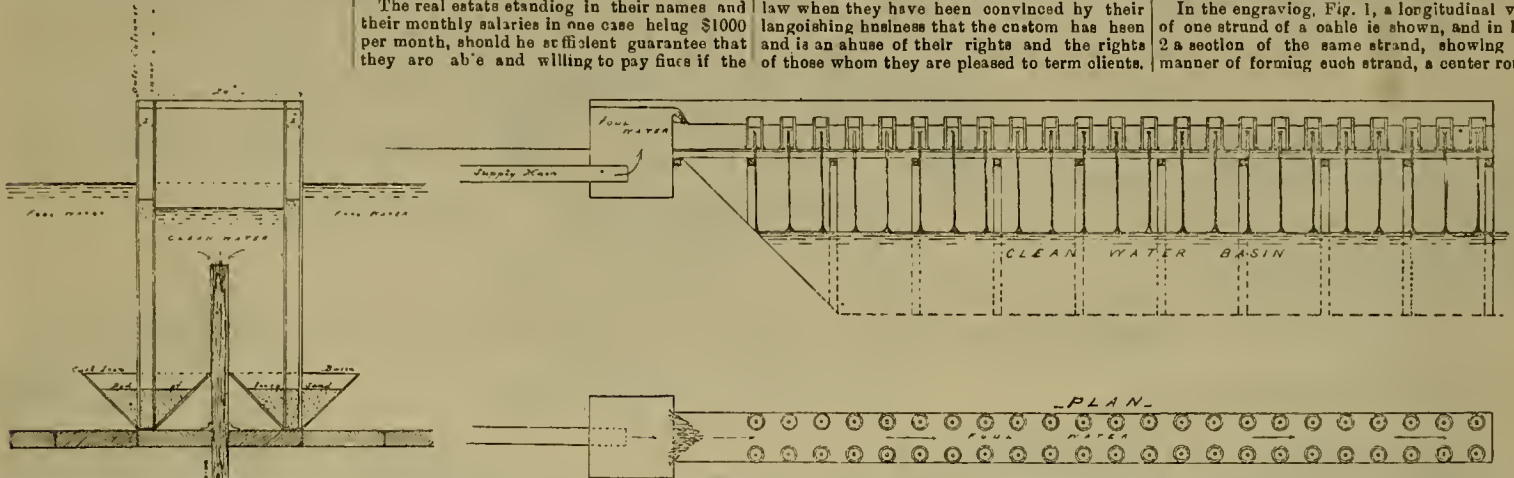

Fig. 3—SKETCH OF WOODEN "SCREEN TANKS" IN USE AT OAKLAND, 1889.—See page 429.

Fig. 1—SKETCH OF WOODEN "SCREEN TANKS" IN USE AT SAN FRANCISCO.

Fig. 2—PLAN OF WOODEN "SCREEN TANKS" IN USE AT OAKLAND PRIOR TO 1889.

careful study of the law might not appeal to the conscience in this age which struggles to wholly disregard the constitutional rights of the humble citizen; but it would certainly suggest an appeal to the well-filled pocket, should redress be sought in legal form by those to whom it is due. The last quarterly bullion report of the several ore-yielding mines in that section reveals a very bad condition of affairs.

It can be truthfully said that the completeness with which the system is organized commands the admiration of every one who becomes familiar with its details. It was originated by a master mind; now it has become the common practice of the common kind. The mills engaged in crushing the output of the various ore-producing mines are not owned by the mines but by certain individual incorporators, who apparently have a monopoly of the business. The mines are under control of boards of trustees, who employ superintendents to manage the property held by them in trust. These trustees, more particularly of the ore-producing mines, apparently act in collusion with the owners of mills, and they make verbal contracts to have the ore of the mines crushed by these mills. These contracts, in defiance of justice, allow the mill companies to take the ore away from the mine unweighed, to mill the same and to make any kind of a bullion return that the mill company may deem proper. In a transaction of this nature, as a matter of fact, the trustees of the stockholders must ignore the law which compels them to have the amount of ore shipped to mill and the assay value thereof reported weekly to the stockholders, as is set forth in the legislative Act of April, 1880. Among any of the old bullion re-

law invoked by the stockholders compels them. Stockholders are constantly complaining of the unjust treatment they receive at the hands of the trustees who represent their property. As the law on this subject is very plainly written, with the exception, perhaps, of the "proxy system," the fault, in too many instances, rests with that large body of stockholders who neglect to invoke the strong arm of the law which was enacted expressly for their protection and relief.

This "proxy system" is a great wrong. The San Francisco Board of Brokers and the Pacific Board of Brokers should take some joint action which should compel the respective members thereof, under penalty of heavy fine, to refuse giving the proxies of their clients' stock to be voted by any one at annual elections. The broker, according to the written contract which he makes all of his clients sign when doing commission business for the client, sets forth that the aforesaid broker is merely an agent for the principal whose name is at-

It is certainly a great oversight and a lack of wisdom to permit such an abuse to continue.

The mill company is amply protected and is fully recompensed for its labor when it has collected \$7 per ton for working ores for the mines. Even the tailings (when they are not too rich) might be allowed to go to the mill by the mining company, but when, in addition thereto, the mill company claim and actually take the slimes and slums, which assay more than \$100 per ton in too many instances, right there the stockholders should step in and establish their claims to all bullion extracted from their ores.

Herein lies the secret of much suddenly acquired wealth of millmen. It is an outrage on stockholders—a deliberate confiscation of their bullion, and the system or custom which tolerates such an injustice should be stopped. If the law invoked to stop such proceedings is found surrounded by insurmountable difficulties, then the whole matter could be made known to the General Government and a thor-

wire being covered by six round wires, and these again by six round and six V-shaped wires alternately. The six V-shaped wires project slightly above the round wires and present a broad, flattened wearing surface which protects and retards the destruction of the other wires, while the wear on the V wires is comparatively slow on account of the great surface exposed to wear.

The V shaped wire is drawn so as to fit in between the adjacent wires, and has an area in excess of what the round wire as usually used has, and being made of slightly softer material than the other wire and of milder steel, does not harden and temper under the circumstances and conditions previously referred to.

Fig. 3 and Fig. 4 are respectively longitudinal view and section of a complete cable made in the manner described, of six strands, as shown in Figs. 1 and 2.

Fig. 5 is the section of one wire of an ordinary cable, before being worn down, and Fig. 6 is the same wire when worn down by abrasion.

Fig. 7 is a section of one strand of a cable as ordinarily made, showing the line or zone of abrasion.

Figs. 8 and 9 are respectively sectional and longitudinal views of an ordinary cable, before the wires are worn, and Figs. 10 and 11 represent the same cable when worn; the inner circular line in Fig. 11 and the elliptically flattened surfaces on the wires in Fig. 10 showing the effect of abrasion.

James' Traction Engine.

A representative of the PRESS visited Rice's Engine Works, 56 Buxome street, this week, to witness a trial of an engine designed by Mr. David James. This engine is intended to be used in farming and lumbering operations, where it is not desirable to go to the expense of laying an iron or steel track.

The engine consists of a platform about 24x6 feet on which is mounted an ordinary horizontal farm boiler.

There are two cylinders—one on each side of the platform, and the piston rods are each connected directly with one of a pair of drive wheels which support one end of the engine. These wheels are about 2½ feet in diameter and 15 inches wide and have flanges on their inside edges; they are placed close together, the flanged edges an inch or so apart. The other end of the platform is supported by a pair of similar wheels. The track on which this engine runs is made of two 4 inch planks about one foot wide, placed about four inches apart. In the space between the planks the flanged edges of the wheels run and prevent the engine leaving the track.

Mr. James claims that the expense of building a road for this engine will not exceed \$1000 per mile. The trial engine is built so as to be easily handled and has a capacity for carrying quite a supply of wood and water.

W. C. RALSTON has resigned the superintendency of the Hogback mine, and on July 1st will go to Seattle to engage in the real estate business. C. F. Hoffman will take charge of the Hogback.

PARKE & LACY COMPANY

THE PELTON WATER WHEEL THE GATES

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD.

OVER 800 ALREADY IN USE.

ORE AND ROCK CRUSHER

Affords the Most Simple and Reliable Power for all
Mining and Manufacturing Machinery.

Adapted to heads running from 20 up to 2,000 feet.
From 12 to 20 per cent better results guaranteed than
can be produced from any other Wheel in the Country.

ELECTRIC TRANSMISSION.

Power from these Wheels can be transmitted long
distances with small loss, and is now extensively used in
all parts of the country for generating both power and
light.

APPLICATIONS

Should state amount, and head of water, power required,
and for what purpose; with approximate length of pipe;
also, whether the application is with reference to *Wheels*
or *Motors* described below. SEND FOR CIRCULARS.

The Pelton Water Wheel Co.

HYDRO-CARBON ASSAY FURNACES

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAM PLATES for SAVING GOLD IN QUARTZ, GRAVEL AND PLACER MINING. PRICES GREATLY REDUCED.

Only Refined Silver and Best Copper used. Over 3000 Orders filled. Fifteen Medals Awarded. Old Mining Plates can be
Replated, Old Plates Bought, or Gold Separated.

These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Sts
San Francisco Gold, Silver and Nickel Plating Works, 653 & 655 Mission St., San Francisco, Cal., E. G. Denniston, Prop'r.
Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and
Copper. SEND FOR CIRCULAR.

For the half-year ending June 30, 1890, a dividend has been declared at the rate of five and forty-hundredths (5 40-100) per cent per annum on Term Deposits, and four and one-half (4 1/2) per cent per annum on Ordinary Deposits. Payable on and after Tuesday, July 1, 1890.

GEO. TOURNEY, Secretary,

— THE —
JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. O. WICKHAM, Taylor Mine, Greenwood, Cal.
 W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,
 And will furnish descriptive Catalogues and quote prices upon application.

VULCAN IRON WORKS,

135-145 Fremont St., San Francisco, Cal.

Mining Machinery. Steam Engines.

STAMP BATTERIES,

PANS AND SETTLERS,

ROCK BREAKERS, ETC., ETC.

SAW-MILL

CABLE-ROAD

REFRIGERATING

MACHINERY.

Special Machinery to Order.

AERIAL WIRE ROPEWAYS.

(Vulcan Patent System)

SINGLE, ENDLESS TRAVELING ROPE.

Elevated on Wooden Posts, from 150 to 2000 feet apart, conveying Buckets of Ore, Coal, Wood, etc.

No Possibility of Load Slipping.

Cheapest Form of Transportation.

No road needed, can be run vertically. No power needed if angle of descent be more than 8 degrees.

CAN SPAN GULCHES 2000 FEET WIDE.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture. We guarantee purchasers of this form of Giants against all costs, expenses or damages which may arise from any adverse suits or actions at law. We are further prepared to furnish Single-Jointed Giants when required. Prices, discounts and Catalogues of our specialties of hydraulic Mining Machinery sent on application.

 Feeder.**

RAILROAD FLAT, CAL., May 15th, 1889.

MESSRS. TATUM & BOWEN, San Francisco—GENTLEMEN: I have had many inquiries in regard to the performance of your oscillating Stamp Quartz mill, to all of which I have made substantially the following answer:

That it will crush and discharge through a No. 30 mesh wire screen, 6 tons of average quartz per 24 hours, that, compared with the common stamps, the power required to do the same amount of work is considerably less—the slipping motion of the stamps reducing the ore much faster than the drop alone can; that the discharge is good, and as to amalgamating and saving gold, my experience with it is that it is just about the same as the ordinary battery.

To the above I shall add that the new Automatic Feed attached is a perfect success. It can, in a moment and without stopping, be adjusted to feed just as "high" or "low" as desired, and can be depended upon to supply the stamps with ore exactly as they need it. This is important, as it saves feeding by hand, which cannot be considered at the present day, or the purchase of a high-priced feeder.

Considered as a convenient mill for prospecting, or for a small mine, it fills the bill.

Yours truly,

[Signed]

JAS. S. REYNOLDS,
 Supt. New York Mine, Railroad Flat.

The Mills as we make them now are Far Superior to the one at the New York Mine.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Paul's Dry Amalgamating Barrel Process.

The undersigned is prepared to erect, or furnish drafts for erecting, machinery, also instructions for working ores by the new patented DRY AMALGAMATING BARREL PROCESS. I assert the ability to overcome EVERY difficulty connected with amalgamating the precious metals, more especially gold, and to add from 25 to 100 per cent to the FREE GOLD yield of any mill working WET. Being the original inventor of dry amalgamation, I have spent over 20 years perfecting the system, now brought to a wonderfully efficient, inexpensive and practical one. I caution all parties against infringements. For further particulars, address

ALMARIN B. PAUL,

Middle Creek P. O., Shasta County, California.

THE RUSSELL PROCESS.

Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class
Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal
nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original
cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies
the information accumulated through long and careful practice before the Office, and the frequent examination of
patents already granted, for the purpose of determining the patentability of inventions brought before us, enables
us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not
new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S. F.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of
stamps of same capacity
2. The freight to mine is less than
one-half of stamps.
3. The cost of erecting is less than
one-fourth of stamps.
4. The power to drive it is less than
one-half of stamps.
5. The wear is less than one-quarter
of stamps.
6. There is no wear except on
shoes and dies.
7. In point of amalgamation it is
superior to any other machine
in use.
8. In its simplicity of construction.

We challenge competition with
Stamps, Ball Pulverizers or and
other ore crushing machines now
before the public.

Send for Circulars and Price List.

IMPROVED BELT FRUE ORE CONCENTRATOR.

The Best Ore Concentrator in the market, having double the Capacity and doing its work as clean as the plain Belt machine, while its concentrations are clean. It is used in a number of Mills, the most notable of which is the Alaska M. & M. Co's Mill, where 24 Improved Belt Frues are taking the Pulp from 120 Stamps, crushing 350 tons per day, and is giving entire satisfaction as against 48 plain Belt Machines, taking the Pulp from the other 120 Stamps.

Price of Improved Belt Frue Vanner, \$825, f. o. b.
Price of Plain Belt Frue Vanner, \$575, f. o. b.

For Pamphlets, Testimonials and farther information apply at office.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., Room 15, No. 132 Market Street, San Francisco, Cal.

Protected by Patents December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883; July 24, 1888. Patents applied for.

There are Over 2200 Plain Belt Machines now in Use.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered 20 more of your machines for immediate delivery. Yours truly,
THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners, having been started, gave such satisfaction that 41 additional Frues and more stamps have been purchased.
ADAMS & CARTER.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company, }
Principal Office, 401 California St., cor. Sansome, S. F. }
Location of Works, Orace Valley, Nevada Co., Cal. }
GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1886.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

DEAR SIR:—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.
DAVID McKAY, JR.,
Supt. North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

CALIFORNIA WIRE WORKS

ESTABLISHED 1852. INCORPORATED 1882.

—MANUFACTURERS OF—
Steel Wire Rope,
—OF ALL KINDS FOR—
CABLE RAILWAYS,
ROPEWAYS and TRAMWAYS,
Mining, Shipping & General Purposes.

WIRE,
BARBED WIRE,
WIRE NAILS,
WIRE CLOTH.
Full Assortment Always in Stock.

OFFICE:
